The *Setting Sun* (No. 54), by Claude, and the *Three Trees*, by Rembrandt (No. 388), are admirable studies of what genius can do without apparent effort through a thorough knowledge of composition. The work of Méryon is well represented at this exhibition, and will repay the most careful and prolonged study. Marvellous as the varied capabilities of the etching needle are, there are qualities which belong to it, and to it alone, and no etcher except Rembrandt ever understood that secret better than the poor sailor whose painful end in Charenton madhouse, driven there by neglect and misery, is not a pleasant page in the history of French art. The mad fantasies in some of his plates, e.g. *The Place de la Concorde* (No. 300), have all a certain undercurrent of pathos; *The Morgue* (No. 304) is not the terrible and revolting subject it would have been made by Regnault had he painted it; but a weird old-world tenderness runs through it, and it is impossible to imagine exactly the same effect being produced by any other artistic medium than the etching needle. Old Paris will owe to him many a regretful friend. What he has done for Paris, Whistler has done to some extent for London, and we venture to place his landscape etchings before his portraits, in which his use of dry point appears to us in some cases to have seduced him into substituting recklessness for freedom. His views on the Thames are masterly, every line having its own work to do, and doing it with a completeness and reticence which are magical. Out of eighty-six catalogued etchings there are fifty-six here, so that there is an excellent opportunity of studying his qualities. The impressions, however, are so fine that one of the evils of dry point is not felt,—namely, the few impressions which can be taken before the plate goes. Legros' heads, we confess, please us better than Whistler's; they are full of power, and the artist seems to think more of the work he has to do than of making the cleverness of his method evident: they are simpler and more direct in the tale they tell. I do not remember to have met Charles Keene as an etcher before, but his contributions to this collection are admirable, and would of themselves go far to justify his high reputation, not only here, but still more on the continent. Hook, too, has some charming little etchings (No. 178, 179) which should not be overlooked. The figures do not give that painfully motionless feeling which is a drawback to some of his most delightful works. Meissonnier's work is disappointing, and the etchings by others after his work—especially one by Lerat—we venture to think more successful than his own. When we turn to those who have chiefly employed the etching needle to transcribe the works of dead and living artists, we cannot but be struck with the sympathetic power this process has as compared with the burin of interpreting all varieties of art. To take the works of one single master—Flameng—nothing could be more widely different than Rembrandt's *Night Watch* (No. 110), Duran's portrait of Mme. Ernest Feydeau (No. 102), the *Harem* by Regnault (No. 114), and the portraits of Guizot and Overbeck (No. 100

and 104). Yet each has its appropriate treatment, varying from the most solid to the most subtle. It is difficult to conceive Rembrandt's *Night Watch* done justice to by any other kind of engraving. Rajon's rendering of Turner's *Old Téméraire* (No. 350), the copies from Meissonnier, Gainsborough, Watts, all exhibit the same adaptability of etching to express different forms of art; and the lovely *Adam and Eve* after Palma Vecchio, by Unger, the German artist, show that qualities which we might be disposed to consider possible to mezzotint alone are quite within the capabilities of the etcher. Unger's reproductions of the groups of portraits with which Franz Hals enriched Haarlem are also excellent. Indeed, if we mentioned all of interest in the collection, we should quite outstrip our limits. Landseer's studies of animals are interesting, but not so much so as we should have expected. Of the father of etching, Callot, we have a nice little series; but the older etchers are not so fully represented, and we miss many of the Dutch and other schools. In modern etchings the exhibition is most rich, and we only wish Mr. Rose could be induced to give London the opportunity of seeing them before they are once more unframed.

P. H. RATHBONE.

NOTES AND NEWS.

THE Queen is about to erect an altar-tomb to the memory of the late Duke of Kent, which is to be placed in St. George's, Windsor. This monument consists of a sarcophagus on which reposes the statue of the Duke. The *Times* of Wednesday, October 22, gave some account of the memorial, and stated that "it will be a very handsome monument from the designs of Sir G. Scott, architect, and is now in the hands of the sculptor in the atelier of Messrs. Poole, Field, and Sons, of Westminster." But the *Times* omitted to add that the statue is by Mr. J. E. Boehm, one of our ablest sculptors. It was completed six months ago, and is still in his studio.

It is proposed that the next exhibition of the Liverpool Art Club should be devoted to embroidery. The increase of attendance at the Government School of Art attached to the Liverpool Institute is very satisfactory, amounting to fifty over that of last year, and is supposed to have arisen to a considerable extent from the popularity of the Corporation exhibition of pictures having awakened a more general interest in art.

A FULL-SIZED copy of the celebrated corona or light-bearer of Hildesheim cathedral will shortly be added to the South Kensington collection. This splendid example of early German metal work has been very carefully reproduced by the German sculptor Küsthardt, and will form a most important addition to the architectural reproductions of the new court. We hope to give further details respecting it when it is set up.

SOME remarkable wall paintings have lately been discovered in the church of St. Mary, at Earl Stonham, in Suffolk. The church has been undergoing restoration, and these paintings were found on removing the whitewash. Mr. H. Watling, writing on the subject to the *Suffolk Chronicle*, states that the entire walls were evidently formerly ornamented with paintings from Scripture history, but that most of the paintings are now so defaced that it is difficult to determine what they were meant to represent. He has made out, however, a Nativity with the wise men and the shepherds advancing to worship on the east wall of the north transept, a martyrdom of St. Catherine (a popular saint in the neighbourhood) in the south transept, and a "rich and perfect representation of the Last Judgment, exquisitely outlined, and evidently painted by a more masterly hand," above the chancel arch. He states also that the original flooring tiles and several other relics of antiquity have been found among the debris of this interesting country church.

AN exhibition of the drawings and paintings of the students in the Female School of Art in Bloomsbury took place last week. Miss Alice Hanslip gained the Queen's Scholarship, value 30*l.*, and Miss S. R. Canton a gold medal for a copy of the Dying Gladiator.

THE Loan Exhibition of Enamels, which has been open for many months at the South Kensington Museum, is now virtually at an end, although the choice collection of painted enamels of Limoges contributed by the Earl of Warwick has not yet been removed. As is so frequently and unhappily the case in exhibitions of this kind, there has been a tedious delay in publishing the catalogue, and we are unable to say that the delay is justified by the accuracy or knowledge of the subject shown by the compiler, whose work on this occasion contrasts unfavourably with Mr. Franks' catalogue of the enamels in the memorable loan collection of 1862. We have noted the following errors, but not as the only ones. An important and brilliant specimen (No. 745), which bears the signature of Susanne Court, has for its subject the Conversion of St. Paul. The future Apostle, who is represented as in command of a body of soldiers proceeding to Damascus, has fallen from his horse and is endeavouring to shield his eyes from the intolerable glory of the vision of Christ suddenly appearing in the clouds above in an attitude of ardent expostulation. The composition, which somewhat recalls Raphael's design for one of the tapestries for the Sistine Chapel, is, we should have imagined, unmistakable; but the compiler of the catalogue suggests that it represents "Joshua giving commandment to the sun, which is represented by a figure of the Eternal Father supported by flying angels and in a glory of clouds and flames of fire." No. 526 of the catalogue is stated to be the work of one of the Courtois family, notwithstanding that it is signed in full on a very conspicuous label LEONARDUS LEMOVICUS, and is also marked in another place with the well-known initials L. L. This early and unusually interesting specimen of the prince of enamellers is dated (in two places) 1536, two years earlier than the matchless hunting horn (No. 730) by the same master, which is now the property of Mr. Hollingworth Magniac. The catalogue, instead of giving the date actually marked on the horn (1538), only mentions that it has been "conjectured" to have been painted soon after 1530; the signature is stated to be Leonardus Ludovicus, instead of Lemovicus. Among the finest of Lord Warwick's specimens are four plaques forming part of a series of framed pictures *en grisaille*, representing the story of Cupid and Psyche from the designs of Raphael as engraved by the Master with the Die. No mention is made in the catalogue of the painter of these beautiful works, although they are well known to be by Leonard Limosin, and two of them are marked with his initials; moreover, a plaque of the same series is one of the treasures of the Louvre, and is figured as the work of Leonard on a screen of coloured photographs in the South Kensington Museum. No. 717, a good portrait, belonging to Sir Richard Wallace, of Henri d'Albret, father of Henry IV. of France, is without doubt also by Leonard. It is subscribed HENRY D'ALBRET. L.L., which inscription is changed in the catalogue into HENRI D'ALBRET. XL.

THE death is announced of Mr. W. Smellie Watson, R.S.A.

The deceased painter, says the *Scotsman*, was the son of Mr. George Watson, the first President of the Royal Scottish Academy, and cousin of Sir John Watson Gordon, a subsequent president. His mother was a daughter of Mr. Smellie, printer, the friend of Robert Burns. Born in Edinburgh, and being from the first destined for his father's profession, young Watson received the rudiments of his art education at the Trustees' Academy, and afterwards prosecuted his studies in London, where he enjoyed the friendship and no doubt profited by the advice of Sir David Wilkie. While yet a young man he returned to his native city, where he was soon established in good

practice as a portrait painter. In this walk of art he attained considerable success, his portraits being specially remarked for their excellence as likenesses, while not without attractive qualities of colour. During a professional career of nearly sixty years he was a regular exhibitor on the walls of the Royal Scottish Academy, and two works from his pencil were hung there last spring. Finding abundant employment in portraiture, Mr. Watson does not seem to have shown any inclination to wander into other fields, though he occasionally varied his practice by painting what might be considered as a sort of fancy portraits, such as *An Ornithologist among his Birds*, or *A Conchologist surrounded with Shells*.

THE Belgian papers have been getting up a sensation lately respecting a wonderful child-artist who has unhappily, by an early death, paid the too usual penalty of precocious talent. The name of this youthful genius was Frédéric van de Kerckhove, and although he died before he was eleven years of age, he had already executed more than 350 works. It is proposed to have an exhibition of these works.

THE *Chronique* of October 20 contains an interesting study, by Eug. Muntz, of the drawings attributed to Martin Schöen in the Uffizj at Florence. These four admirable drawings, of the authenticity of three of which there is but little doubt, have never before been adequately described, although they have been photographed both in the Braun and Philpot series from the Uffizj. M. Muntz promises, in a future number, a description of Schongauer's drawings in the Basel Museum.

The *Levant Herald* announces that Dr. Dethier has returned from an official mission to Cyprus with some eighty packages of various kinds containing relics of antiquity. They consist chiefly of such portions of the artistic discoveries made in Cyprus by General de Cesnola, and other antiquaries as the latter have ceded to the Ottoman Government in compliance with the provisions of the recent law on treasure-trove in Turkey. Among them are the statue of a bearded Venus, and some remarkable specimens of ancient Greek pottery and glass. During this excursion, Dr. Dethier found an opportunity of completing his decipherment of the inscription discovered by Mr. Frank Calvert on the site of old Troy, which appears to set forth the text of some remarkable decrees. The *Levant Herald* also publishes in its issue of October 24, the letter from Mr. Frank Calvert which appears in the *Athenaeum* of November 7 and 14.

It is announced that the sum realised by the exhibition of the decorative works of M. Baudry amounts to 48,262 francs.

THE STAGE.

"SWEETHEARTS."

A CHANGE in the programme has made the Prince of Wales's Theatre once more a place to which a man may go. The performance of *The School for Scandal* there excited curiosity; no one will now be found to maintain that it produced satisfaction. We know it was continued during four or five months of the playgoing year, but that is nothing for the *School for Scandal*, and not much for the little Prince of Wales's Theatre. The house is tiny: success is a tradition: people could hardly believe that there was at last something very much like a failure. Besides, amidst all that was so bad, so pitifully feeble, Lady Teazle and Joseph Surface were played discreetly, if not happily; there was a good Charles Surface and an excellent Sir Benjamin. Again, there was some decorative china, and some marqueterie, to draw the special lovers of *bric-à-brac*. And, last of all, they charged ten shillings for a seat that generally costs seven; and that was a conclusive proof of the merits of the performance.

They have now revived Mr. Robertson's *Society*, and produced Mr. Gilbert's *Sweethearts*. *Sweet-*

hearts has a genuine charm, both in the piece and in the acting; but it is played (if one may be allowed to say so here) at too early an hour for modern habits. Why not play the well-known little comedy first, and keep the new work of Mr. Gilbert till an hour more convenient to those most likely to appreciate it? Most people have seen *Society* already. *Sweethearts* is a piece which no one ought to miss.

Mr. Gilbert calls his work a "contrast." It is too slight to be a comedy, as well as too little varied in interest and in character. It is like a French *proverbe* in a couple of scenes. It requires the most delicate acting—and it gets it. Its story is entirely simple; the matter is scant; the manner, all. But such as the matter is, let us set it down. The curtain rising, discloses to us a garden of a modest country house, in which a garrulous gardener is talking to a hoyden; and the hoyden, his master's daughter (none other, of course, than Mrs. Bancroft) is hearing from him, with a sly pleasure, the praises of a youth of her acquaintance. The youth appears (it is Mr. Coghlan, dressed like David Copperfield when he made love to Dora), and he helps the hoyden to plant a bough of sycamore which he has fetched for her from London, from her old home—from the quaint red-walled garden of some house at Hampstead, which she loves for its association with her childhood. He cares for her very much, but she only cares for the sycamore and the old garden—at all events this is all that she avows—and she takes care for a while to keep the garrulous gardener within hearing, so that she may provoke her lover into impatience, though she does at last send into the conservatory this person who is alike superfluous to the piece and to its hero. No sooner is the gardener well away than Harry Spreadbrow announces his departure for India. For dramatic purposes he has put off the announcement rather late—having only time, apparently, to say a long good-bye before he takes the coach and steamer. His good-bye, though tardy, is very full of feeling. He tells his love in it, with point and brevity, and asks for something which he may always wear with him, in eternal remembrance of his bewitching hoyden. The hoyden gives him, not a flower, but a geranium pot. He gets a flower at last, and gives her one, and asks her to say something pleasant to him, out of her own mind at the moment. She asks pertinently what it is that she is to say. He longs for an avowal of her devotion, but she wishes him "a pleasant voyage," and goes on watering her plants, while he rushes to the coach with dreams of eternal constancy. But before her plants are all quite watered, she begins to cry, like a child that has lost a nurse or a playmate. And the curtain falls.

Thirty years pass—it is eighteen seventy-four—and the sycamore bough from the red-walled garden at Hampstead has grown a goodly tree, and there sits under its bare branches in autumn, when its brown dry leaves dance their dance of death around it, a woman prematurely old, who was the hoyden of thirty years ago. A stranger, who had pleasant associations with house and village, calls and asks to be allowed to see the place again. The place has changed: the village is a town, he says; and where he left a pump, he finds a statue to the county member. He says he is Sir Henry Spreadbrow, and hears with surprise that he is talking to Jenny. She is married, he supposes. He will have great pleasure in making the acquaintance of her husband. He has forgotten her very name. No, she is not married. She has often thought of him. She parted from him lightly, and has kept for thirty years his flower and his memory. He parted from her with the usual vows of constancy, and was flirting with a middle-aged governess before he had been a week on board ship. But he is touched at last—successful man of the world that he is—with her lasting remembrance of him, and as he thinks he is still young because he can ride to cover twice a week and walk his five-and-twenty

miles without feeling it (though he looks, by the bye, singularly incapable of either of these feats), he desires to continue the subject of their old love, which Jane Northcott says is past. And he is allowed his way—perhaps because she is too sweet a woman to quite see that on the whole he has been worthless—perhaps because the London public likes a comfortable end and would not relish the profounder poem of such a final parting as M. André Theuriet has given, in his *Jean-Marie*.

Well, the man has made vows, and the woman has kept them, and something of the temper of Mr. Gilbert's mind—as an observer and an artist—is shown in the contrast. This contrast is legitimate enough, no doubt. One that appears to me less reasonable is that between the hoyden of 1844 and the spinster of this present year. There are moments when a coquette stays her coquetry, and it is inconceivable that a woman who had cared so much for a man as to remember him, and to be single for his sake, during thirty years, should have let him go away to India without one stronger word than the commonplace hope that he might have a pleasant voyage (which he *had*—with the governess) and be prosperous when he got there—which he was, for he came back “Sir Henry.” Mrs. Bancroft, too, it appears to me, accentuates and emphasises the contrast rather too much to be natural, though not too much to be effective. This hoyden of the first act—one of those girls whose charm and value it may be the fashion to recognise only because they are tantalisingly rude and impudently inconsiderate—would never have become the calmly sensitive old woman of the second: this last a picture well imagined, no doubt, by Mr. Gilbert, but (save for what I think the impossibility of the contrast) realised by Mrs. Bancroft with a rarer excellence. As a picture, if you can either forget the impossibility, or believe in the possibility of the circumstances, Mrs. Bancroft is perfect. Sir Henry says that she has “mellowed,” which is only a flattery. The truth is, she is saddened, yet not embittered,—the slow result, on a woman, now and then, of a sweet and timid loneliness: and this character Mrs. Bancroft subtly makes visible, in raiment, gesture, and voice. Her first impersonation—that of the ignorant acridulated hoyden, who plays with happiness as a child with toys—is clever, but already somewhat too familiar, though interesting now and again through some fresh tone, some half-meaning, some sharp or delicate turn which shows the comedian's art. But her second impersonation is not interesting at intervals, but interesting from end to end, and artistic with a restrained pathos held at every moment in complete and exquisite command.

Mr. Glover, as the garrulous gardener, fails to give character to his part: a part, moreover, not existing for its own sake, but only for the sake of the early exposition of the story. Mr. Coghlan in both acts does his share well: first as the diffident, yet ardent youth, and then as the infirm stranger, who is prompted by curiosity to see the place of his boyish love. But it is the refined, though slight motive of the piece itself, and the acting of Mrs. Bancroft, with its pleasant surprises and delicate effects, that should chiefly lead you to the theatre; and it is only a pity that the development of this motive both by author and actress should be accomplished at the cost of consistency. Harry Spreadbrow becomes strangely hardened, but Miss Northcott much more strangely softened. Making all possible allowance for the effect of loneliness, and trouble, and thirty years, one still says, the germ of this delightful and pathetic woman was never in this acrid girl.

FREDERICK WEDMORE.

SPEAKING of the performance of *Le Demi-Monde* of Dumas at the Théâtre Français, we asked last week whether we might ever see this piece in England. We have now some reason to

think that under certain conditions the answer to that question would be in the affirmative. In French, the piece would probably be licensed here.

MR. BYRON'S new piece at the Gaiety Theatre—which, in allusion to the vulgar proverb, has had bestowed upon it the name of *Oil and Vinegar*—is as light as a thing can be, and will be thought by some playgoers to be a far less considerable piece than his last comedy, *Old Sailors*. We are of a different opinion. The piece at the Gaiety makes no effort or pretence to be anything except laughable, and it succeeds in all that it aims to be—there is a good deal of freshness in its fun. The piece at the Strand is also found laughable—very laughable indeed, by playgoers easy to please—but it is burdened by what is supposed to be a plot of serious interest, which it can't sustain. Accordingly the newer piece—that at the Gaiety—with its humility of aim, is very much more successful in point of art, if art has much to do with it. The story is of the fortunes of certain gentlemen who take their sweethearts down to Richmond for the afternoon and dinner, under the protection of a chaperone who is good enough to miss her train. One of the men is genial; the other, ascetic; and the genial man is engaged to a very serious young woman, while the ascetic man is engaged to a young woman who enjoys the world. In the course of some discussions before dinner it becomes plain that all is not very smooth sailing with the respective couples: the genial man relishes a momentary flirtation with the merry young woman, and the ascetic man finds solace in the society of the other man's sweetheart. The two young women withdrawing for a time, the men fall to discussing their prospects, and quoting the old saying that oil and vinegar don't mix, they are disposed to change partners, when—conveniently for Mr. Byron's moral—they are overtaken by sleep, and are warned in a dream. But the spectator doesn't know till the end that it is a vision he is witnessing: he thinks it is the actual story, still being developed, at a six months' interval, and the following is what he sees. He sees the Pringle interior—Pringle, the ascetic man, has married the serious young woman, and is so weary of her seriousness that he would fain find consolation in some trifling impropriety. Like has spoilt like: his very nature has changed. Next, the spectator sees the Cloverton interior—Cloverton, the genial man, has married the merry girl, and she is merry and noisy till he is weary of merriment. As merry a cousin of hers—he stands as a symbol of the dangers of her temperament—is in too constant attendance upon her. They make merry music together, and the merry wife sings a fast song, in which Miss Farren, being befittingly skittish, makes sure of an encore. The genial man has become a very Jacques. Then trap-doors open on the stage, scenes shift, and *dramatis personae* disappear by unforeseen mechanical contrivances, and in a trice the spectator beholds the two men once more at the Thames-side hotel, where they yawn, stretch, and get up, each to say to the other that that was a foolish notion about changing their loves, and that things are best, and will remain best, as they are—the oil with the vinegar. Miss Farren, Miss West, Mr. Arthur Cecil, Mr. J. G. Taylor, and Mr. Robert Soutar are the principal persons who enact this “morality.” They preach their merry week-day sermon in a fitting mood. You laugh mildly for an hour, and think no more about it.

Sweethearts, the new piece at the Prince of Wales's Theatre—discussed in another column—does not stand alone in the programme. It is followed by a revival of Mr. T. W. Robertson's *Society*, which, though by no means the first piece which this author wrote, was the first to be very popular. It is true he had produced *David Garrick* at the Haymarket before that; but *David Garrick* was an adaptation from the French, and, after all, not quite so good a one as Mr. Albery's *Doctor Davy*, which was also from the French

Sullivan. *Society* has little merit of construction, but much freshness of dialogue. Its best scene is its second, “The Owl's Roost,”—a caricature of a literary club where everybody is distinguished and everybody impecunious; but even “The Owl's Roost” is not quite so good a scene as it promised to be, for it ends abruptly before we get the speech we have been expecting. And this is very characteristic of Mr. Robertson, who often whetted an appetite he did not intend to satisfy. The cast of the piece at the Prince of Wales's is now entirely different from that with which the play was first produced. Now Mr. Archer performs Lord Ptarmigan, and Miss Fanny Josephs Maud Hetherington; Mr. Coghlan is Sydney Daryl (in place of Mr. Bancroft, who is now Stylus), Mr. Arthur Wood is John Chodd, Mr. Glover the younger Chodd; and Mr. Collette O'Sullivan.

At the Haymarket Theatre the performance of *Our American Cousin* is now supplemented by that of Planché's vaudeville, *The Loan of a Lover*: a piece which has merits of itself, known already long ago to the public, and at the present moment one merit to boot—that of presenting to the Haymarket audience Miss Walton in a new character: the Miss Walton from New York who was so well received in the revival of the Dundreary comedy or farce. Miss Walton's appearance was the only pleasant circumstance connected with this Dundreary revival.

MR. IRVING'S Hamlet continues to be the talk, not alone in theatrical circles. On the whole, the opinion expressed with regard to it is as high as the interest in its production was great, though some writers whose opinion is entitled to respect have pronounced either against it or very mildly in its praise. Another opinion besides that of the habitual writers on the theatre may be of interest to our readers to supplement the criticisms already given, and we therefore quote the last lines of an article in which in its last issue the *Spectator* discussed the new Hamlet. After taking exception to here a point and there a point, the essayist who writes the article in question praises the performance of the third act—to which the criticism in this journal drew special attention. The *Spectator* concludes:—

“Finest of all, however, is the death itself. The sudden rage with which he bursts upon the King when he finds that both wine and foil were poisoned, and deals the death-blow for which he had never gained nerve before; the spasmodic effort with which he snatches the poisoned cup from the hand of Horatio, and bids him live to clear his name; and finally, the gathering glooms of death settling slowly down upon his face, as his discursive imagination hovers on the border of the unseen land, and anticipates all the terrors of the imminent disclosure, are all as fine as they can well be, and send away the audience with a conviction that they have seen an actor of rare power, who in a few years has made wonderful progress in his art, and who may—for he is yet young—easily reach even the highest point attainable in it. He still needs more of the discipline of the French school. He can still be stilted, and not unfrequently hard. But the gain of a few years is so marvellous that we do not know what more he might not gain. In a few of the most difficult scenes, his Hamlet is all but perfect. He has the power in him to make it so in all.”

MDME. THÉO has been appearing in *La Jolie Parfumeuse* at the Théâtre des Fantaisies Parisiennes at Brussels.

OFFENBACH'S *Madame l'Archiduc* is the greatest success the Bouffes has had for a considerable time. It is the greatest success Offenbach himself has had since the period of *La Grande Duchesse*.

THE Porte Saint Martin has produced an instructive spectacle—*La Tour du Monde*—of which the subject is derived from the travel-books of Jules Verne.

It seems likely that a fable of La Fontaine's—certainly not, as some one has suggested, a fine chapter of Michelet's in *L'Amour*—has suggested to Messrs. Meilhac and Halévy the subject of their

new comedy *La Veuve*, which was produced a few days since at the Gymnase.

"L'époux d'une jeune beauté
Partait pour l'autre monde. A ses côtés sa femme
Lui criait : Attends-moi, je te suis ; et mon âme
Aussi bien que la tienne est prête à s'envoler.
Le mari fait seul le voyage."

The widow, we remember, is inconsolable ; but her father is a philosopher, and he says his say :—
"Ma fille, lui dit-il, c'est trop verser de larmes ;
Qu'a besoin le défunt que vous noyiez vos charmes ?
Puisqu'il est des vivans, ne songez plus aux morts."

Je ne dis pas que tout à l'heure
Une condition meilleure
Change en des noces ces transports ;
Mais, après certain temps, souffrez qu'on vous propose
Un époux beau, bien fait, jeune, et tout autre chose
Que le défunt.—Ah ! dit-elle aussitôt,
Un cloître est l'époux qu'il me faut."

Time passes : Time is a consoler, and the fabulist a cynic. Hear the young widow presently :—

"Où donc est le jeune mari
Que vous m'aviez promis ? dit-elle."

Now, in the new comedy it is not a father but a friend who suggests consolation, and it is not Time that is the consoler. The heroine recovers through a ruder shock. In regulating the affairs of the deceased it is necessary to be particular, and the bills sent in to the deceased must be examined minutely. Among them is a jeweller's bill, large—very large—and it is plain that half the trinkets ordered were destined for unrecognised wearers. A little common, a little vulgar, perhaps, the device, but the *désillusion* is complete. The bust which was cherished in the widow's drawing-room is banished to the apartments of the servants. The widow can be inconsolable no more. And—

"Où donc est le jeune mari
Que vous m'aviez promis ? dit-elle."

The sentiment and style and execution of this piece are entirely modern. Meilhac and Halévy know the society of new Paris as well as Sardou : perhaps even better. They may regard themselves as fortunate that among the interpreters of their light work are artists as serious as Landrol, as delicate and touching as Blanche Pierson.

MUSIC.

CONCERTS OF THE WEEK.

Two pieces of special interest formed the most important features of last Saturday's concert at the Crystal Palace. Chief in importance among these was Mendelssohn's 95th Psalm for chorus and orchestra. Few of this great composer's works have been more undeservedly neglected than his Psalms. Of these he has written in all five with full orchestral accompaniment—the 42nd, 95th, 98th, 114th, and 115th; one (the 55th) with organ; and three (the 2nd, 22nd, and 43rd) for an eight-part unaccompanied chorus. Of the five large and important works belonging to the first class, the 42nd was given some years since by the Sacred Harmonic Society, and I remember to have heard the 114th Psalm from Mr. Joseph Barnby's choir before it expanded into the Albert Hall Choral Society. The other three have not, I believe, been given in public, at least not on any adequate scale, for many years.

Mendelssohn's treatment of the Psalms has some resemblance, as to form, to Bach's "Kirchen-Cantaten," minus the chorales. Perhaps a nearer parallel may be found in Handel's "Chandos Anthems," which were also written with instrumental accompaniment, or in some of the older anthems of the English church-composers belonging to a period when the orchestra was not entirely banished from the church service. Of the series, the 95th Psalm, which was given last week, is, on the whole, one of the finest. Though less grand than the stately "When Israel out of Egypt came," with its massive eight-part harmony, and less beautiful than isolated portions of "As the

Hart pants," the effect of the work is one of such varied and sustained interest that it is surprising that it is not oftener brought to a hearing. None of the five movements of which it consists are of exceptional difficulty: it is not too long, occupying but little more than half an hour in performance; and the music is of a character which appeals alike to the cultivated musician and the average amateur.

It is a curious thing that Mendelssohn in setting the words of this Psalm has begun at the sixth verse, "O come let us worship and bow down." After the invitation to prayer, set as a most melodious tenor solo and chorus, the second movement, "Come let us sing," gives the opening words of the Psalm in a grand chorus which is one of its composer's most jubilant inspirations. Whether from regard for the convenience of the chorus is not very clear, but this movement on Saturday was taken considerably slower than the time marked in the score. It certainly gained thereby in breadth, but on the other hand it to a large extent lost its festive character. The following "canon" for the chorus in two parts, "For the Lord is a mighty God," is a fine specimen of Mendelssohn's mastery of contrapuntal writing. With the exception of Mozart, and possibly of Haydn at his best, no composer has approached so nearly to Bach as Mendelssohn in the combination of the strictest scientific forms with the utmost freedom of idea. The melodious duet for treble voices "In His hands are all the corners of the earth," is no less beautiful than the more popular "I waited for the Lord" in the *Lobgesang*, though the charming combination of the chorus with the solo voices which so enhances the beauty of the latter is wanting in the present movement. The fine *fugato*, "For His is the sea," with its reminiscences, towards the close, of the opening chorus, leads to the tenor solo and chorus "Henceforth when ye hear His voice," one of the gems of the whole, though by no means the most popular number. In truth of expression and unaffected pathos this movement has rarely been surpassed. It has frequently been wondered why Mendelssohn should have so far deviated from custom as to write in G minor the finale of a work which begins in E flat; and the mystery is solved by a note from "G" in Saturday's programme, in which it is stated that an additional chorus is in existence among the composer's MSS., in the original key of E flat, to the words "For the sea is His, and He made it," which is evidently designed as a new finale to the work. This MS. bears date "April 11, 1839," whereas the psalm itself is dated "April 6, 1838." It is clear, therefore, that this new finale was, as "G" says, an afterthought, though it is not easy to account for its not being included in the printed score, which was not published till 1842. A repetition of the Psalm with this additional movement is promised shortly at the Crystal Palace, and will be looked for with much interest. The solo parts of the Psalm were sung by Mme. Lemmens, Miss Thekla Fischer (a *débutante* with a pleasing voice, who appeared to be very nervous), and Mr. Vernon Rigby. The Crystal Palace Choir made its first appearance this season, and sang all the choruses admirably. Though the alto and tenor parts sounded rather weak, it is gratifying to note the very great improvement in this chorus, as compared with three or four years ago, when it used to be, if not absolutely discreditable, at least quite unworthy of such concerts as those in which it took part. Now, thanks to Mr. Manns and the directors, all that is changed; and if last Saturday is to be taken as a fair sample of their performances, the future appearances of the chorus may be looked forward to with pleasure rather than with apprehension.

The absolute novelty of the afternoon was the first performance in England of the late H. H. Pierson's overture to *Romeo and Juliet*. It is impossible after a single hearing to give a decided opinion on so very novel and original a work as

this. All I can do is to record the impression it produced upon my own mind; how far such impression would be modified by a closer acquaintance it is impossible to say. The first feeling produced by the music is that the composer is a powerful and original thinker; he arrests attention at once; one feels that he has something of his own to say. The overture is full of charming and poetical ideas; and yet, as a whole, the effect is thoroughly disappointing. As in another overture (*As You Like It*) by the same composer given last season, there is such a total disregard of form in the piece that it is impossible to follow the thread of the ideas. The thoughts succeed one another as in a dream, without logical sequence; and there is no apparent reason why, if the overture had been begun with the last movement and played backwards, it should not have sounded just as well as it did. The instrumentation, it should be said, is charming, and the performance of the overture by Mr. Manns's band was magnificent. The remainder of the programme consisted of Beethoven's symphony in F, the overture to *St. Paul*, and songs by the solo vocalists already named. To-day Raff's *Lenore* symphony is to be given for the first time in England.

The seventeenth season of the Monday Popular Concerts was inaugurated on Monday evening last. The catalogue of the works performed at these admirable concerts since their institution in 1859, which was distributed in St. James's Hall during the evening, is so interesting that it deserves to be dwelt on for a short time, as showing the large amount of good in the diffusion of the knowledge of the best music which has been effected during the last fifteen years. It is hardly needful to remind our readers that before the establishment of these concerts good chamber-music could only be occasionally heard, and then almost always at a very high price. Up to the close of last season 485 concerts had been given, including those on Saturday afternoons. At these the enormous number of 513 different instrumental works of more or less extent, by 57 composers, have been brought forward. Beethoven, as might be expected, has been the most largely represented; he heads the list with 88 pieces. Next comes Mendelssohn with 51 works, Mozart with 49, Sebastian Bach with 45, and Haydn with 40. The number of repetitions of various works affords a clue to their relative popularity, and to the taste of the "Monday Popular" audiences. Here again Beethoven is *facile princeps*, the piece most frequently performed being his well-known "Kreutzer Sonata," which has been given no less than 37 times. Second in the list is his Septett, which has been performed 27 times. The third place is a "tie": Mozart's Clarinet Quintet and Mendelssohn's Trio in C minor have each been heard 22 times. Of piano solos, Beethoven's "Waldstein" sonata would appear to stand highest in favour, having been brought forward on 16 occasions; the same composer's "Appassionata" coming next, with 15 performances. Herr Joachim's two great solo displays are also high on the list—Bach's "Chaconne" having been given 18 times, and Tartini's "Trillo del Diavolo" 17 times; while Signor Piatti's favourite piece, Boccherini's Sonata in A for violoncello, has been played at 16 concerts. It may be questioned whether any parallel in musical activity (unless it be at the Crystal Palace) can be found to that shown by this catalogue. These concerts have become now so much a matter of course that one is apt to forget how much they have done for art; and the short retrospect now given may therefore, at the commencement of a new season, not be out of place.

Last Monday's concert opened with Mendelssohn's string quartet in E flat, Op. 44, No. 3. A disappointment was in store for the audience, as Signor Piatti, who had been announced to take his usual place, was too unwell to appear. A very effective substitute was, however, engaged in Signor Pezzo, a violoncellist not only of well-

known talent, but of great experience in classical music. M. Sainton was the leader, while Messrs. Louis Ries and Zerbini occupied their usual posts as second violin and viola respectively. With such a quartet, a very fine performance of Mendelssohn's brilliant work was given, as might be anticipated. The scherzo, taken at a "break-neck" pace, and yet with the utmost finish, was enthusiastically encored. Dr. Bülow, the pianist of the evening, chose as his solo Beethoven's sonata in E, Op. 109, which he played in his well-known style, about which it is difficult to say anything new. The variations, with which the work concludes, were perhaps the gem of the whole performance. The other instrumental pieces were Beethoven's Sonata in A, Op. 69, in which Dr. Bülow was joined by Signor Pezze—the latter gentleman having here an opportunity of distinguishing himself of which he took full advantage, a very excellent performance being the result—and Rubinstein's interesting trio in B flat, Op. 52 (Messrs. Bülow, Sainton, and Pezze), a work which was produced at these concerts for the first time last season, and which well deserved a second hearing. The vocalist was Miss Sterling, who as a "Lied" singer has few equals. She was heard in four numbers from Schumann's *Dichterliebe*, and in a new song by Sullivan. Her performance of the "Ich grolle nicht" of Schumann was one of the finest pieces of musical declamation to which I ever had the pleasure of listening.

It is obviously impossible for any reporter not endowed with omnipresence to keep pace with such a series of concerts as those commenced last Saturday at the Albert Hall. All that will be possible, especially in a paper which is not exclusively musical, will be a brief record of what is done, with a more detailed notice of any features of special musical interest. The programmes of the past week have been most satisfactory, and such as promise well for the future, if they may be regarded as fair samples of what is to be expected. The opening concert may be considered (and was no doubt intended) as an epitome of the whole scheme, with the exception of sacred music, which would have been inappropriate in a miscellaneous selection. Classical music was represented by Beethoven's Choral Fantasia (the piano part played by Miss Agnes Zimmermann) and Mozart's "Non più andrai." Wagner's overture to *Tannhäuser*, and the March and Chorus from the same opera, illustrated the "Modern German" school. Professor Oakeley's "Edinburgh" March, and vocal music by Hatton, Balfe, Stevens, and Barnby gave due prominence to the music of our own country; besides which there were a new waltz by Mr. Dan Godfrey, selections for military band, and an organ solo by Dr. Stainer. The "Ballad Night" on Monday must be passed over, to mention the first "English Night" on Tuesday. For this the selection was most admirable, including Sullivan's overture to the *Sapphire Necklace*, J. F. Barnett's orchestral fantasia "The Lay of the Last Minstrel," recently produced at Liverpool; Mr. Cusins's Pianoforte Concerto in A minor, played by the composer; Bennett's Capriccio in E, and various vocal pieces. The chief features of the "Classical Night" on Wednesday were Gade's Fourth Symphony, in B flat, Schubert's overture to *Rosamunde*, Beethoven's Concerto in G, and Mendelssohn's Capriccio in B minor, both played by Dr. Hans von Bülow. On Thursday the *Messiah* was given, and last night was the first "Wagner Night," for which selections from *Tannhäuser* and the *Meistersinger*, as well as the "Kaisermarsch" and Gade's First Symphony, were set down for performance.

The alterations recently made in the Albert Hall with the view of improving its acoustic properties have been successful to a degree which can hardly be imagined save by those who have had the opportunity of judging for themselves. The arena (formerly a kind of sunken pit several feet in depth) has been raised nearly to the level

of the lowest row of seats of the amphitheatre, and the great *velarium* has been lowered, so as further to confine the sound. The result is most satisfactory. I attended on Wednesday (the classical night), and from my seat in the amphitheatre could hear distinctly the most delicate passages of the accompaniments in a way certainly never before realised in this gigantic auditorium. Of the performance, too, it is a pleasure to be able honestly to speak in terms of unqualified praise. Mr. Barnby has under his command a most excellent and well-balanced orchestra; and if at present the exquisite finish which results from constant playing together, and which is the great charm of the Saturday Concerts at the Crystal Palace, is wanting, there is no reason why it should not be shortly attained. The rendering on Wednesday of Gade's charming symphony in B flat (which may be recommended to Mr. Manns's notice), left really nothing to desire. A word of mention must be given to a new singer, Mdle. Johanna Levier, who is not only the possessor of a very good voice, but who sings like a true artist. The lady will doubtless be heard again, and make her mark, as she deserves to do. Dr. Bülow played, as usual, magnificently.

EBENEZER PROUT.

MR. JOHN HOLLINGSHEAD, manager of the Gaiety Theatre, issued invitations on the afternoon of last Wednesday, to a most ingenious performance of handbell ringing, by a family of Spanish children, whose ages range from six to sixteen, and who are called Los Ninos Campanologos. They are seated at a table covered with bells of various sizes, and each child except the youngest—who wields a tiny sheep-bell with a vigour and agility beyond praise—is entrusted with the superintendence of four or five bells, and is required to lift them singly from the table in order to form each note. With this machinery German waltzes, national hymns, and Spanish dance-music are excellently played, the rhythm being perfect, and the harmony only broken by the occasional discord of two tenor bells. The performance will make its mark upon English audiences, and will not, we trust, be compelled to decline upon the music-halls, or be mated with the clown of the pantomimes.

DR. HANS VON BÜLOW's second recital took place last Saturday at St. James's Hall. Though containing no single item so important as the "Thirty-three Variations" played at the previous recital, the selection was of great and varied interest. The pressure on our space this week, however, prevents more than a bare record of the works performed. These were Handel's Suite in D minor, Schumann's "Faschingsschwank aus Wien," and various shorter pieces by Bach, Bennett, Moscheles, Schubert, Beethoven, Chopin, Moniusko, Tchaikowsky, and Liszt.

A NEW organ, built by Messrs. Brindley and Foster, of Sheffield, for the Bow and Bromley Institute (adjoining the North London Railway Station at Bow), was opened on Wednesday week last by Mr. W. T. Best, by whom the specification of the instrument was drawn up. Though only of moderate size, containing two manuals and twenty-seven stops, it is of remarkable richness and power. The quality of tone is excellent, and reflects great credit on the builders. The mechanism can be no less highly commended, though Messrs. Brindley and Foster laboured under great difficulties, arising from the vibration occasioned by the passing trains of the North-London Railway, over which the Institute is erected.

COPIES of the *Glasgow Herald*, which have been forwarded to us, contain accounts by the evidently competent musical reporter of that paper of the operatic performances in that city of Mr. Mapleson's company, which are very highly spoken of. The first of the orchestral concerts in the City Hall has also taken place, and appears to have been a complete success. The most impor-

tant items were Mozart's *Jupiter* symphony, and Beethoven's C minor concerto, played by M. Theodore Ritter.

WITH reference to the report mentioned in the ACADEMY of the 24th ult., as to the engagement of Dr. Hans von Bülow for the Hofopertheater at Vienna, the *Signale* now states that the negotiations which were set on foot have fallen through, as Dr. Bülow has been engaged by the American impresario Ullmann for a series of concerts in America early in the year 1876.

BYRON's *Manfred* with Schumann's music is in preparation at the Hofopertheater in Vienna, and is to be given for the benefit of the benevolent fund of that theatre.

THE first "Schleswig-Holstein Musical Festival" is to be held at Kiel next June.

HERR H. STIEHL, the well-known composer, has, we understand, been appointed conductor of the Philharmonic Society at Belfast.

THE celebration at Dresden on the 31st of last month of the completion, by Dr. Julius Rietz, of forty years' activity as a conductor, was carried out in a manner which must have been most gratifying to the worthy artist. The company of the Dresden Theatre presented him with a silver fruit basket, the members of the royal band gave a silver laurel-wreath, and the Musikverein of Düsseldorf, the conductorship of which society was Rietz's first appointment, sent a splendid album containing views of the Rhine. Then Ferdinand Hiller from Cologne came, and in the name of the Rhenish artists, brought a present of 9,000 marks (450*l.*). The vocal societies "Liedertafel" and "Orpheus" elected him an honorary member; the King awarded him a distinction allotted to but very few—the appointment as "General Musical Director," a post which has been previously held by Spontini, Mendelssohn, and Lachner. Besides this, a deputation, headed by Carl Reinecke, came from Leipzig, and presented him, in the name of his friends and admirers at Leipzig, with the sum of 10,000 marks (500*l.*).

No. 133, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The German Arctic Expedition of 1869-70, and a Narrative of the Wreck of the "Hansa" in the Ice. By Captain Koldewey, Commander of the Expedition, assisted by Members of the Scientific Staff. Translated and Abridged by the Rev. L. Mercier, M.A., and Edited by H. W. Bates, F.L.S., Assistant Secretary of the Royal Geographical Society. (London: Low, Marston, Low, and Searle, 1874.)

"GREENLAND," writes honest Edward Pellham, first of English seamen who wintered in Spitzbergen and had the good fortune—scurvy-riddled—to come back and tell the tale,

"is a country very farre northward. The land is wonderfull mountainous, the mountaines all the year long full of yce and snow: the plaines in part bare in summer. There growes neither tree nor hearbe in it, except scurvy grasse and sorrell. The sea is as barren as the land, affording no fish but whales, sea-horses, seales, and another small fish. And hither there is a yearly fleet of English sent."

This description may not be particularly accurate as to its scientific details, but it sufficiently expresses the popular ideas regarding the country then and for long afterwards; so that when bluff Tom Bowling, master mariner, swore that Squire Random's chaplain had, if he "came up with him," better "be in Greenland—that's all," he only expressed the vague general belief which in the minds of the men of his day attached to this frozen triangle of ice and snow which has so long depended from the upper ends of our maps of the Northern hemisphere. The western shores of Greenland have been long settled and explored by the Danes up to lat. 73°, while the coast line north of this parallel is partially known to us from the expeditions of Inglefield, Kane, Hayes, and Hall. The ice-covered interior is still a blank, while the east coast was until recently almost equally so. Scoresby burst in a favourable season through the icy stream which is continually pouring down its shores from Spitzbergen, and rudely mapped out part of the coast; while Graah crept in search of the lost Icelandic colonies a little way up from Cape Farewell. Still chartographers had an easy task in portraying East Greenland: a dotted line expressed the mass of our knowledge regarding the greater part of this mysterious region. To win laurels in the exploration of this coast, and also to use it as a basis of operations for penetrating northwards towards the Pole were the purposes of an expedition despatched by the Bremen Polar Society, aided by subscriptions from

most of the North German towns (though almost entirely at the instigation of Dr. Petermann), under the command of Karl Koldewey, who had already shown himself an apt seaman in an expedition of a preliminary character which he had commanded in the Spitzbergen seas in the previous summer. The expedition consisted of two ships—the *Germania*, a steamer under the command of Koldewey; and the *Hansa*, a small sailing ship under Hegemann, both vessels being accompanied by a very complete staff of scientific men. The Kaiser—he was only King of Prussia then—saw them off from Bremen, and amid the cheers of thousands the vessels sailed out of the Weser on June 15, 1869. Life on board a ship is rather dreary. Accordingly, in the early weeks of the Expedition there is little to record: the cabin life, the amusing disputes between the smokers and non-smokers regarding the hours in which the cabin was to be occupied for räuchern—the sea-sickness experienced by nearly all, especially those from the interior of Germany who had never even smelt salt water until then—the fish-trafficking transactions with heavy-sterned Dutchmen on the Dogger Bank—the naturalists' notes—the boisterous fun in shaving the neophytes as the vessel crossed the Arctic circle—are about the only incidents worth recording, until in lat. 74° 47', long. 11° 50' W., the expedition sights the first ice.

Now their labours and their troubles commence in earnest. Hitherto the vessels have been in company. Towards the end of August they get among great fields of ice, through which the vessels had to be tracked when steam was not available; and on August 27, while in sight of Little Pendulum Island, the vessels, though only thirty-five miles from each other, get separated in a thick fog. They never saw each other again. The *Hansa*, inextricably enclosed in the great ice-field, out of which, unaided by steam, it was soon seen to be a hopeless task to free her, then began to meet her untoward fate. While the vessel was embedded in the ice, and every moment threatened with the fatal "nip," the crew made the best of a bad job, and amused themselves with seal hunting, celebrating the captain's birthday, the nightly whist, skating, a little science, and a great deal of white-bear hunting, the visits of the Arctic foxes, which "with tails high in the air, shot over the ice fields like small craft sailing before the wind," and so on. Meantime the bricks of patent fuel were taken out of the vessel, and a roomy house built on the ice field into which provisions were stored against the contingency of the vessel going down. The prudence of this course was soon apparent. On the night of September 21, in lat. 70° 52', twenty-four miles from the Greenland coast, which could be dimly seen now and then, though no way could be found through the icy labyrinth, the ill-fated *Hansa* went down. Her crew now found themselves, with the stern Arctic winter approaching, alone on an ice-floe slowly drifting south. Their only hope was of attracting the attention of some of the Eskimo who might possibly be on the coast, for the moving ice-field prohibited the hope they had once entertained of being

able, by means of their boats, to reach the coast of Iceland. Their floating territory was about seven miles in circumference, by about two in diameter. It was not an extensive promenade, nor a very safe one; but with stolid German patience they began to content themselves with their lot. "We are the Lord's passengers," was their pious conclusion, and confident in this they prepared for the worst, while hoping against hope for the best. The bear and walrus hunting supplied some amusement. Once willow-like leaves blew to them off the land they could never reach, and an Arctic fox, which they had not the heart to kill, paid them a visit from the same wished-for, but unapproachable region. Still slowly but surely the current was carrying them southward: they were in the midst of that Spitzbergen ice-stream which carries the ice on to the East Greenland coast, and brings bears and drift-wood to the Danish settlements on the south-western shores. On December 4 they passed the mouth of Scoresby's Sound. The temperature was still high, though variable. On December 18, in lat. 67° 30', they experienced the lowest temperature they ever encountered, viz., -20° Fahr. Christmas still finds them on the ice-field, which they celebrate as best they can, and make merry round a Christmas-tree of pine wood and birch broom. It was but a sorry Christmas—the last most of them expected they would ever celebrate. In twelve days, from December 27 to January 8, they drifted 52½ nautical miles S.W. to W. ¼ W. A new danger now threatened them. Numerous bergs were ever and again impinging against the floe and threatening to break it up; and several times, in dire fear of their icy territory being destroyed, they bivouacked in their boats to await the worst. In all their discomforts, want, hardship and danger of all kinds, the men kept up a cheerful frame of mind; and the cook, who was now an important functionary, seems to have troubled himself very little so long as he could get his tobacco. Once when the ice-field was threatening to divide in two, the only remark this Arctic chef made was: "If the floe would only hold together until he had finished his kettle! he wished so to make the evening tea in it, so that before our departure we might have something warm!" Between January 8 and 12 they drifted southward fifty-six miles. Washing is a luxury now only indulged in twice a week, and the scientific men, with the fortitude of philosophers, entirely abandon this unnecessary superfluity. Weeks have elapsed since the clothes have been off their backs, and hair and beard have not been trimmed for weeks. Their only hope now was of reaching the Danish settlements in South Greenland.

Towards the end of January cheering signs of life began to appear. A hawk and a raven—the almost solitary representatives of winter Arctic bird-life—flew overhead; seals appeared on the floe; then there came more ravens; a fox visited them; linnets and snow-buntings perched on their house, and were so tame that they would in five minutes allow themselves to be caught three times running. They must now be nearing the land.

They become careless. The most costly books are torn up for the most trifling purposes. The gilded frame of the cabin looking-glass is used as firewood, and the glass thrown on one side. "Streams of petroleum and brandy flow in the course of heating the stove; packets of tobacco furnish a welcome means of warmth. Why is gunpowder of no use to us? We like letting it off in fireworks for our pleasure, and to pass away the time!" Hitherto they have all been in good health with the exception of one of the men being seized with a slight attack of scurvy. But now a gloom comes over the devoted members of the forlorn hope. One of the most resolute of the officers becomes mentally affected, and their labours are increased by the care which must be taken of him. In February the sun is seventeen degrees above the meridian: furs are tossed off: it seems almost like summer. On April 17 the festival of Easter is celebrated as they lie tossing backwards and forwards in the Bay of Nukarbik. "To us," they write, "it was a real Resurrection festival." Gradually their floe had been decreasing until it was assuming proportions so limited that their house was getting alarmingly close to the water's edge. On February 7, open water was sighted in lat. $61^{\circ} 12'$, and it was resolved to take to the boats. Feverishly they load them, and almost sadly—with the sadness with which Thackeray says a well-constituted convict should leave Van Diemen's Land—they left the faithful ice-craft which had borne them for 200 days more than 600 miles into more hospitable latitudes. Snow-blindness added to their discomfort. A storm of snow forced them again to take refuge on the ice; but at last, after being twenty-one days in their boats, they succeeded, after dragging them only 2,000 paces in thirteen hours, in landing on the dreary island of Illuidlek—

" . . . an island salt and bare,
The haunt of ores, and seals, and sea-mews' clang."
They afterwards discovered that the Eskimo who inhabited the coast hard by had seen them on the ice, but scared at such an unexpected sight had in terror concealed themselves.

How they slowly coasted along, and finally landed at the Moravian mission station of Frederiksthal, we will allow our readers to ascertain from the narrative itself. The latter part of the voyage was exciting enough, but the dangers connected with it were small in proportion to what had preceded it. Here finished a voyage with which there is none in the annals of Arctic enterprise to compare. Ross's escape from Barrow's Strait, Kane's from Smith Sound, or even the heroic tale of Barentz as told by Gerrit van Veer, pales before it. It will live in the annals of heroism as an everlasting honour to the German name. They occupied themselves with excursions around the Danish settlements until the Danish vessel sailed for Copenhagen. The narrative of these, though interesting, is of comparatively little value, as we have much fuller accounts of the same district in the works of Rink and other writers. They seem to have been rather coldly received by the Danish trading officials, who had long memories for the Slesvig-Holstein wars. But with

these squabbles and recriminations we have nothing to do. Foolish men are found all the world over, and are not wanting even in South Greenland. On September 1 the whole crew were landed in Copenhagen—well, but ragged and weather-beaten, as the writer of these lines can testify.

The *Germania* got separated from the *Hansa* on August 4. Its proceedings, though greatly more valuable for science, were yet of a much less exciting character. Our space will only admit of a very brief summary. On August 5 it reached Sabine Island, one of the Pendulum group, but, after surveying the island, could discover no traces of Sabine's observatory. On the 13th they were stopped on their northern voyage by a barrier of ice in lat. $75^{\circ} 31'$, and returned. The remainder of the month of August was spent in scientific work, and part of September by Koldewey and Payer in an exploration of Fligely Fjord, during which coal was discovered on Kuhn Island. The musk ox, hitherto unknown on the east coast, and but doubtfully at all in Greenland, was found in plenty. Another sledge excursion in October and November proved the insularity of Clavering Island. On November 5 the sun disappeared, but still they accomplished 180 miles in nine days, and discovered a new fjord. From October 12 to the beginning of May the *Germania* was frozen in. The winter was passed in scientific work, a newspaper was established, amusements of all sorts were indulged in, and Christmas was celebrated with great pomp and dancing on the ice under the stars. Their winter quarters were in lat. $74^{\circ} 32' 16''$ N., long. $18^{\circ} 49'$ W. During the winter also a sledge journey was taken by the captain, Payer, and six seamen to the north, for 150 miles, adding one whole degree to our maps, terminating in a grim cape named after one Otto von Bismarck. Part of an arc of the meridian was measured by Copeland* and Börgen. On July 11 the ship was freed, and on the 22nd sailed northward, but was stopped by the ice in lat. $75^{\circ} 29'$. They now determined to try their fortunes to the south. They soon discovered that the "Mackenzie Inlet" of Scoresby did not exist, and that "Bennet Island" was only a hilly promontory. Sixteen new islands were discovered, and the great Franz Joseph's Fjord, stretching with numerous ramifications into Greenland, was explored and mapped. Petermann's Peak on its shores is 13,000 feet in height, while Mount Payer is 7,200 feet. It is especially noted that no traces of a complete glaciation of the interior were visible. The expedition did not penetrate sufficiently far from the shores to ascertain this. On the shores of West Greenland, unless the traveller passes over the intervening land skirting the shores, no trace of the "inland ice" can be seen. And as no moraine comes over the "inland ice," the probabilities are that no mountains or land intervene in the way (see "Das Innere des Grönlands," Petermann's *Geographische Mittheilungen*, October, 1871). On August 17 the expedition left the coast, and on September 11, 1870, reached Bremen, to find the "Vaterland" in the

* An Englishman, assistant in the Göttingen observatory, but now Lord Ross's astronomer at Parsonstown.

midst of war. The results of the expedition may be stated to be: 1. The non-existence of uninterrupted open water along the East Greenland coast. 2. East Greenland not a suitable basis of operations for reaching the Pole. 3. Re-survey of part of the coast, discovery of new fjords, &c., and various researches in physical science and natural history. Many traces of the Eskimo were seen, but none of recent date, and no aborigines themselves. 4. The necessity of having the coast as a basis of operations for advancing into the ice. Lastly, that Smith's Sound is after all the best route for a voyage of polar exploration.

One word as to the work itself from which we have drawn this outline. It is only an abridgment of the much more voluminous German narrative, without the valuable natural history and general scientific appendix. Nor is this to be deplored. The few who are specially interested in the work of the expedition can readily refer to the original work, while the heaviness and minutiae of detail would effectually deter readers in any other country than Germany from its perusal. Most of the original illustrations, one new one (after Rink, p. 177), a few of the chromolithographs, and two of the maps, appear in the present abridgment. The translator seems to have accomplished his task well, and a comparison of this work with the original edition shows that he has performed the delicate work of abridgment with much judgment. The name of the learned and accomplished editor is a guarantee that his portion of the task would be performed with grace and tact. Nor are we disappointed. Still, here and there we are led to wish that some one practically acquainted with the Arctic regions had read the sheets over, as slips for which the translator could hardly, under the circumstances, be held responsible, would not then have appeared. For instance, at p. 263, the translator adds a note: "*Kamiken* appears to be a Polish word for some description of fur." It is, of course, the familiar Greenland word for Eskimo boots. Again, what kind of "stickleback" is *Calanus hyperboreus*? One or two Teutonisms, such as "machinist" for "engineer," &c., protrude here and there. However, these are trifles, and in no way detract from the general value of a work which is destined to be extensively read, and to stimulate greatly the interest in Arctic exploration, now again to be resumed in England after the long night of slumber during which other nations have been reaping, under many disadvantages, the glory which ought to have been ours by birthright.

ROBERT BROWN.

The Old Régime in Canada. By Francis Parkman. (Boston: Little, Brown, & Co.; London: Sampson Low & Co., 1874.)

THIS volume is one of "A Series of Historical Narratives," by the same author, under the general title of *France and England in America*, and is Part IV. of the series. To a certain extent the volume is complete in itself, as it deals with a distinct period of the history of Canada during its occupation by the French; but some knowledge of the contents of the former ones is

necessary in order to comprehend fully all its references and allusions. As a rule, an author, as well as his readers, labours under more or less difficulty when he produces his work in this piecemeal fashion, because he generally writes his later volume with a better knowledge of the facts with which he dealt in his first, and cannot now alter his treatment of them, however much he may desire to do so.

Mr. Parkman furnishes, perhaps, an exception to this rule, for there is a continuity about the general narrative contained in his four volumes, and a perfect cohesion of the details, which are truly remarkable, and are the more worthy of notice because (a fact perhaps not generally known) he suffers from the same physical disability under which his predecessor, Mr. Prescott, so long and so successfully laboured. When other historians, and notably one of his own countrymen, with no defect in their vision, blunder perpetually over the old records which they consult, and from which they profess to derive inspiration, it is highly creditable to Mr. Parkman that, dependent as he must necessarily be upon the assistance of others in the examination of his original material, he is rarely, if ever, caught tripping.

These volumes are the result of a determination on the part of the author in his early youth, and that he has not given them to the world in undue haste is proved by the fact that the issue of the present volume finds him in his fifty-first year. The amount of patient research which they have involved, and the care which he has bestowed upon the new material which his enthusiasm and perseverance have brought to light, show that he has been actuated by better motives than a desire for temporary popularity.

Still, his work must not be regarded as exhaustive of the subject to which it is devoted. That is of a character too important and extensive to be dealt with finally in what the author himself modestly describes as only "a series of historical narratives." It is simply impossible that a volume of 400 octavo pages, like the one before us, treating of a period extending from 1640 to 1763, can embrace a tithe of the historical details of that century and a quarter which ought to be preserved. The exact student of history will hardly be content with the rapid and condensed narration of actions and events of the gravest importance, sometimes within the space of a single page; but even he will be forced to admit that Mr. Parkman has left no important point entirely untouched, and that his narrative, rapid and condensed as it is, shows that he has thoroughly grasped the whole subject. In a word, he has so carefully and artistically outlined the entire history of the period with which he deals, that his successors will find their labours greatly lightened, and will have little to do but to elaborate his masterly sketches.

Hitherto our knowledge of the history of the French settlement and occupation of Canada has been derived chiefly from French sources, and, however we may have been disposed to question the impartiality of the French historians, it has been difficult to contradict their statements or refute their

conclusions, from the mere want of positive data upon which we could rely. Perhaps the most popular work on the subject has been the *History and General Description of New France*, by the Rev. P. F. X. de Charlevoix, S. J., a translation of which, in six volumes, by John Gilmary Shea, with his copious annotations, has been recently published in New York. It is to this work Mr. Parkman candidly refers his readers, if they desire to see the subject from a point of view opposite to his own. From this it may correctly be judged that Mr. Parkman differs, both in his facts and conclusions, not only from the secular French historians, but also from the Jesuit writers, who, it may be supposed, have always made the very best of their case. Mr. Parkman's fairness and anxiety to do justice may be seen from the fact that he takes the position of an umpire between the two classes of writers, and that, while he condemns the Jesuits for colouring their statements too highly, he also rebukes the seculars for attributing to the Jesuits, during their control of Canada, certain conduct too scandalous for ready belief, and some of which he himself abundantly disproves. For every fact which he states he gives the appropriate and, when possible, the exact reference; and when it is stated that the greatest portion of the documents consulted and referred to are to be found in the archives of the Marine and Colonies at Paris, we may have no hesitation in according to them the same confidence with which we regard similar documents in our own Public Record Office. These facts, thus substantiated, Mr. Parkman sets forth, in rapid succession and unbroken continuity, in an easy and straightforward narrative, without any attempt at startling effect or dramatic display, and they inevitably suggest the conclusions at which it is evident that he has himself arrived, though he does not always directly indicate them to the reader.

The story—for it is a story, and an interesting one from beginning to end—of the operations of the Jesuits is told in a vivid and animated style, and carries conviction with it, line by line, and paragraph by paragraph. We see among other things how, under the guise of a missionary enterprise, the Jesuits obtained undisputed control of the Canadian territory, and how they used and abused the power they acquired. We see a few of the Jesuit fathers conscientiously endeavouring to carry out the principles they professed in efforts to civilise and Christianise the native Indians, and behold their pious labours brought to nought by the machinations of others, often their superiors, not so conscientious, who for the sake of worldly gain introduced to the savages what has ever been their fatal curse—brandy, or, in their nomenclature, "fire-water"—under the effects of which they became the mere tools and victims of the French traders. Mr. Parkman has established conclusively the charge, always denied, that the Jesuits traded extensively in furs, even from the very beginning of the colony; and that the King of France, whose Canadian revenue was drawn from this trade, encouraged, rather than otherwise, the employment of brandy in dealing with the natives, in spite of the contrary decision of the fathers of the Sor-

bonne, Père la Chaise, and the Archbishop of Paris, all of whom he had consulted, and who had pronounced it a mortal sin. Indeed, he even wrote to the Bishop of Quebec that "the brandy trade was very useful to the kingdom," and that "the consciences of his subjects must not be disturbed by denunciations of it as a sin."

Not the least interesting portions of Mr. Parkman's book are the occasional glimpses he affords us of social life in Canada during the Old Régime, and it is well to contrast the manners and customs of the French Canadians of this period with those of the colonists of New England.

Mr. Parkman very effectively traces the steady decadence of the one colony while the other was as steadily increasing in importance, and brings his history down to the date of the English Conquest, the details of which are reserved for a future volume. Surveying the then wretched condition of the people, and the hopelessness of any improvement under French rule, his closing words may also appropriately close this brief notice of his admirable book, viz.: "A happier calamity never befell a people than the conquest of Canada by the British arms."

JOSEPH LEMUEL CHESTER.

On Compromise. By John Morley. (London: Chapman & Hall, 1874.)

THE word compromise, as commonly used, has two sets of associations, one with the idea of practical expediency, the other with that of dishonest concession. Mr. Morley's essay will perhaps contribute to fix usage to the latter sense, since he writes throughout as if the compromises which men most often make, or are tempted to make, were always between right and wrong, true and false, or, at the most complicated point, between right doing and wrong believing. An innocent compromise consists simply in "splitting the difference" between two alternatives: a process that seems to demand that the alternatives shall be of the same kind, and the sacrifice one of quantity or degree. Such a compromise as the sacrifice of conviction to convenience is at once felt to be immoral, because, properly speaking, it is not a compromise at all; there can be no equivalence of concession between things essentially different and incommensurable. If A firmly believes a given act to be right, and does not do it because B firmly believes it to be wrong, he does not compromise, he yields to the uncompromising strength of principle in B. The real sphere of compromise in such bargains is upon the question of time, the one thing in which the opponents have a common and equal interest. Both parties suppose (what of course is only approximately true), that their several opinions will continue unchanged whether they act upon them or not, and if A consents not to act at once, it is in order to give B time to come over to his view as to the desirableness of acting; thus, while B continues to resist merely on the merits of the case, A concedes something which is non-essential, i.e. the precise date of the reform. Neither Mr. Morley, nor the general conscience of mankind, sees any harm in this last form of compromise; but

the mere statement of the case helps to explain why the morality of compromise is a question of special interest to the Liberal party. Progress may be for the worse or better, anyway time is the natural ally of its partisans, and for that very reason, the only kind of compromise which it is in their power innocently to offer would be rejected as illusory by a strict and intelligent conservatism. Mr. Morley is quite aware that the laxity of principle with which he reproaches his own side is at least as marked a feature of his opponents; but, unlike some other ardent believers, he claims the whole army of waverers as tacitly pledged to conversion. If any opponent has the amiable weakness to concede that he *may* be right, Mr. Morley suspects him of moral and intellectual cowardice or compromise if he does not diligently and forthwith proceed to discover and act on the discovery that he *is* right; whereas in many cases the inconsistency, and such immorality as there may be in invincible puzzle-headedness, would lie in the original concession, not in the failure to follow it up to all its logical consequences.

The discussion follows two lines, as the author deals with present facts or general principles. The weak points of the argument are where the one is brought to bear upon the other. It is universally agreed that men ought to act conscientiously according to their lights; and though, in the face of irresistible reasoning, it is still sometimes denied, almost every one agrees that neither do men gather grapes of thorns, nor right acts from base motives and erroneous beliefs. But if, as a fact, clear ideas about the right and true and a noble enthusiasm for ends recognised as such, are, unfortunately, rare or wanting amongst the present generation, we are not sure that want of honesty or courage is the prime defect, rather than simple ignorance and feebleness of will. Mr. Morley refers to the zeal for truth of the French philosophers of the eighteenth century. But though Voltaire and Diderot had strong opinions, it by no means follows that they owed them to their strong sense of the duty of having opinions; their desire to reach a state of intelligent certainty on all points of interest was but one passion among many, and perhaps the least primary of all. Devotion to abstract Truth is a generalisation from devotion to a variety of particular truths; and if none of the truths accepted at a given date naturally inspire the enthusiasm of believers, the fault may be, not indeed in the truths, which are good as far as they go, but still in the intellectual rather than in the emotional apparatus of the believer, whose enthusiasm may be only held in suspense till the dawn of larger and more stimulating convictions. All that Mr. Morley says of "intellectual responsibility" will be admitted by those whom it does not concern, but it supplies no remedy for his real grievance, which is the impossibility of inspiring men who do not exactly know or particularly care what they think about Darwin or the Deluge with a holy enthusiasm for disestablishing the Church of England, or removing the last faint traces of a social penalty on unbelief.

La Rochefoucauld says, "Si nous résistons à nos passions, c'est plutôt par leur faiblesse

que par notre force," and the remark is at least equally applicable to convictions. Half-grown opinions vegetate passively, and wait for each other to give, what they do not attain singly, the consciousness of their own existence. The rudimentary enlightenment of most Englishmen is scarcely sufficient to terrify them into hypocrisy; they continue from habit to contrast the brilliant and the safe, but the mass of good sober citizens never yet made the mistake of thinking their own unfeigned convictions dangerously advanced, and the politic reluctance to carry out half-accepted principles to their legitimate practical conclusions, which Mr. Morley thinks our worst national sin, may be accounted for by the fact that the principles he has in his mind are only half accepted, as well as by the taste for compromise developed by the historical antecedents of the country. The same excuse might be urged, though less successfully, on behalf of the class which holds and professes fixed opinions which it hesitates, nevertheless, to act upon, the persons who believe, if not in the "possible utility of error," at any rate, in the possible harmfulness of truth. For the most part, those who speak of an opinion as probably true, but practically dangerous, mean that they do not see their way either to applying it beneficially themselves, or to persuading other persons so to apply it; but political principles which have a direct reference to practice have also natural corollaries regulating their application, and the conviction is not insincere but incomplete which fails at the moment to include assent to the latter. The intellectual difficulty of thinking quite rightly is simply doubled when the point at issue is practical, and we have to decide not only what is true, but what we shall do with our knowledge of it; and the prevalence of this kind of indecision, though undoubtedly a political misfortune, is not necessarily a sign of moral degradation. Parts of the present essay may be read as a sighing confession that it is growing very hard to be a consistent Liberal, and perhaps it is in this very sense of the difficulty of the incumbent task that the unstrung nerves of the party will be braced to stronger efforts and more glorious aspiration. It would take a hero of no mean order to satisfy the present demand for statesmen who would be at once ready and confident in action, and yet tolerant and sympathetic towards the forces which they were bent on overruling. After all, no extenuating circumstances can affect the truth, or *à propos* of Mr. Morley's main thesis, that ignorance and timidity serve chiefly to strengthen each other's hands for the enterprise of leaving ill alone.

In form the essay naturally recalls Mr. Mill on Liberty, which it is partly meant to supplement in substance; but not to mention other differences, it is less argumentative and more distinctly a *pièce d'occasion*. On one point at least it may be suspected that the author exaggerates the evils which he very justly and eloquently denounces. There are so many men untroubled by religious doubt, who do not have family prayers, who attend church with extreme irregularity, and neglect the sacraments, that the scrupulous conformity which he attributes to considerable numbers of confirmed unbe-

lievers, would be, to take no higher ground, a gratuitous hypocrisy, and as such not likely to be practised on a large scale in any society, however Laodicean in its principles. It is impossible to suspect Mr. Morley of intentional economy; but the politician probably had more than the philosopher to do with the attempt in his preface to distinguish between the moral position of the State Church and other religious sects, the older and more important of which are scarcely less firmly "established" by the inheritance of circumstances in grooves no longer parallel to the spiritual needs of the time. All religious sects have formulas of doctrine which the clergy teach and the laity hear, and in an age of faith the endowment of the teachers is a means of securing, not of restricting, their independence. In the present "time of loud disputes and weak convictions," no opinion has a claim to be endowed as that of the community, but the disendowment of the Established Church would go a very little way towards disposing the clergy of that and other denominations to aid "in the long, difficult, and plainly inevitable work of transforming opinion." The moral earnestness which inspires the positive side of the present work will have more influence in that desired direction than even its justest criticisms. EDITH SIMCOX.

The Times are Changing. [Tiderne Skifte.]

Skuespil i 3 Akter af Frederik Paludan-Müller. (Copenhagen.)

Adonis. Et mythisk Digt af Frederik Paludan-Müller. (Copenhagen.)

SINCE Paludan-Müller called us in 1862 to listen to the seraphic melodies of his *Paradiset*, the greatest living poet of Denmark has preserved a silence only broken by his prose romance of *Ivar Lykkes Historie*. Interesting as the latter work is in various ways, it has none of the characteristics of harmony and sculptural form for which one especially values this writer's lyrical poetry. But now, after so many years of retirement, the poet comes forward again, and he brings a new book in each hand—a prose comedy in the one, and an epic myth in the other. It is truly agreeable to welcome him again, and to find in the work of his sixty-fifth year as much freshness, though perhaps not so much force, as in that of the younger days when he raised the temple of Danish literature a whole storey higher with *Kalamus* and with *Adam Homo*.

Tiderne Skifte ("The Times are Changing") has just been brought out on the boards of the New Danish National Theatre in Copenhagen, and with signal success. No wonder! It is in all respects exactly adapted for the peculiar tastes of the audience, and the peculiar training of the actors that it finds there. The tradition of the Copenhagen comedy, shifting in the third act to some green nook in the woods, *ud i Skoven*, is kept up with a fidelity worthy of Heiberg, and the sentiments, dialogue, and situations have all the old innocence and liveliness and essential Danishness.

The scene is laid in Frederick V.'s time, that is, about 1755. A great nobleman, Count Pless, has two children, Otto and Anna. Otto has fallen in love with an

actress, Miss Bird, whom he has seen act Dido at Baron Holberg's new theatre in Copenhagen. Anna has fallen in love with Dr. Lind, a young physician who has been her father's house-doctor, and who once saved her life. Count Pless will not listen to these suits, sends Otto to travel on the Continent, and locks Anna up. When the curtain rises, Otto has just come back to Denmark after two years' absence, during all which time he has been travelling with Dr. Lind, the two friends keeping watch over one another's constancy. The first act represents the stolen meeting of the two pairs of lovers. Miss Bird, who is an excellent little creature, has spent all her spare time in the cultivation of her mind, her only sorrow now being that Count Otto does not much care for books. She has written to Otto's father, but in vain. Dr. Lind, meanwhile, has imbibed the ideas of Rousseau, and exhorts the other three to appear without powder and the other unnatural articles of dress then in vogue. They make a solemn pact so to do, and to appear before Count and Countess Pless so unadorned, and to try once more to soften the father's heart.

The father's spy, however, has overheard all this, and we find Count Pless, in the second act, determined to hold out to the last. In an interview with Dr., now Professor Lind, he loses all temper, and when the Countess also comes over to the young people's party, he is at his wits' end, and meeting the famous minister of state, Bernstorff, he begs him to judge between his family and himself. Bernstorff agrees to be judge, but declares that he must consider the matter, and invites Count Pless to share his carriage next day, when he is about to drive out to the country palace of Fredensborg to see the King. Meanwhile little Miss Bird (Jomfru Fugl) is possessed with an idea. In vain her fellow-conspirators beg her to share it with them. All she will say is, they must hire a carriage and drive off together, they four, early next morning, to Fredensborg.

The third act opens in the palace-gardens, where Miss Bird discloses to her friends that her grand idea is to stop the King as he passes, and beg him to help them. The others are extremely startled at the notion, but her enthusiasm overrules their objections, and they go and hide while she awaits the King. Presently Frederick V., in the best of spirits, and accompanied by Bernstorff, makes his appearance. The beauty and distress of the girl charm and move him. He encourages and comforts her, and at last she tells him her petition. He is good-humoured enough to propose to become umpire between the father and the children, and he tells her to wait where she is for half-an-hour, and he will return. Count Pless comes by, and finds Miss Bird, who knows him though he does not know her, and she wheedles him into great sympathy with the injustice that is being done her by a supposed father of the middle classes, whose ridiculous pride the aristocrat is very severe upon. He goes away; Miss Bird summons her three friends, who are hardly marshalled before the good-natured King reappears and summons Count Pless. The latter is enraged to find himself so gulled,

but cannot refuse to let the King be umpire. The King then, with great formality, decides first against the young people, who are to give up their Rousseauish doctrines, and return to the use of powder; and secondly, against the father, who is to consent to the marriages; thirdly, to remove the objections of low rank, he gives Miss Bird a place at court, and makes Dr. Lind his private physician. Finally, he invites the whole party to dine with him that evening without ceremony. So the curtain falls.

It will be seen that the plot is very slight, but the working out is charming and fresh, and there are many points that must make it a good acting play. The title *Times Change* takes its idea from Count Pless's determination not to alter with altering times and fashions. The drama is wholly in prose.

Adonis differs from *Tidene Skifte* as much as a sonnet of Shakspeare's differs from the *Comedy of Errors*. It is a short poem of less than fifty stanzas in the manner of the early mythological studies in which Paludan-Müller developed his poetic individuality in its purest and loveliest form. It belongs to the same class of his writings as *Tithon* and *Amor og Psyche*, though it is much slighter and more direct than these. Charon is represented as just setting his sail to catch the weak wind that blows along the Styx, when he hears a voice cry to him from the landing-place; and before he has time to turn, a beautiful youth has leaped into his boat. The thin ghosts shudder together at the unwelcome coming of one so full of life. Charon inquires his name, and learns that it is Adonis, who, snatched away from men by Aphrodite, has found that good fortune at last a burden, whose heart has remained unsatisfied among all the Paphian roses, and who now has escaped from her, and goes to lay his devotion and his desire at the feet of Persephone, flying from pleasure that he may find rest. "For I must always love, and always love a goddess; that was my destiny, and I have followed it all my life. Venus and Proserpine were near when I was born, and before I began to breathe two goddesses were contesting to possess me." Aphrodite has held his manhood first; now, weary with a love so exciting and so exhausting, he turns with irrepressible longing to the goddess, crowned with calm leaves, in whose hushed dominions there are no budding and no falling flowers. The boat of Charon passes in silence down the dark channel, roofed in with rocks, described by the poet in words that recall Mr. Stanhope's wonderful picture of this year. Arrived at the harbour of death, a shade summons the coming shades to the banquet of Pluto. Adonis sees them disappear, as he stands alone upon the desolate margin of the stream. Presently a dead-pale maiden comes, bearing a torch, and cries: "Charon, is he come?" This girl Persephone sends daily to enquire if Adonis has arrived. At last, after so many years; the answer is yes! She binds his eyes, and leads him through the realms of death, down into the hall of the infernal gods, where, when his eyes are unbound, he sees Persephone sitting on her throne in silence and solitude. A tinge of red flies to her white cheeks, she opens her

majestic arms, and breathes his name; with an outburst of passionate love he throws himself at her feet, and tells her how even in the arms of Aphrodite he has loved her, and now has flown to her to experience with her keener and deeper pleasures than the earthly goddess could give him. But Persephone repels his caresses, and warns him that she has no love to give him that can be likened with the love of passion; if he seeks for that he is deceived, but she also loves him, and she has better gifts for whom she loves. While the beautiful Adonis still clasps her knees with his hands, she bids a maiden fill a beaker with the waters of Lethe. He drinks the divine nepenthe, and has only just time to respond to the kiss the goddess presses on his mouth before he sinks at her feet in slumber, and lays his weary head upon her knee. So through the ages these two remain unmoving: Adonis in a happy dream, forgetful of all past passions and desires; Persephone bending over him with a grave smile, pleased with her final victory over her earthly rival. The open heavens are over them, and time is only marked by the waxing and waning of the moon.

Short as it is, this poem is a masterpiece of melody and dignity, and we welcome it with delight as a sign that the master-hand of Frederik Paludan-Müller has not yet begun to tremble or to fail.

EDMUND W. GOSSE.

EPOCHS OF HISTORY.*

II.

(3) *The Thirty Years' War*. By S. R. Gardiner.

It is a constant boast in Germany that historical research and historical writing is not there restricted to the history of Germany itself, but embraces most European countries as well, and has produced important works relating to the history of France, England, Italy, &c. And yet Mr. Gardiner, in his *History of the Thirty Years' War*, presents us with a work which ought pre-eminently to have been the task of a German historian—a task which no German has yet accomplished. Germans, it is true, have not been wanting in searching and profound investigations into the causes, the course—at least in some of its periods—and the prominent episodes of the "Thirty Years' War;" but no one has taken the pains to lay the results of so many and such severe studies in a concise and compendious form before that part of the public which is desirous of knowledge. So far as we are aware, there have in recent times appeared only two concise works in German embracing the whole period of the Thirty Years' War; the one, by Sporschil, was composed thirty or forty years ago, and therefore necessarily takes no cognizance of late researches; the other was published last year, nominally as a second edition, by Keym, who, on account of his Ultramontane tendencies, ignores the results of recent investigation.

If a brief narrative of the Thirty Years' War is to have any value in our days, it

* Edited by E. E. Morris. (London: Longmans & Co., 1874.)

must be the work of one who has taken part in the scientific study of the war itself, or at least of the period in which it took place, and who through his own labours has his understanding open to the many controverted questions which arise. In this respect Mr. Gardiner is eminently qualified for the task; his extensive researches among archives which he has set down and worked out in several books, have enabled him to reach a stand-point whence it is possible to survey the infinite perplexity of the story of the Thirty Years' War, the opposing claims of parties, and the contradictory statements of individual historians.

On a closer examination of the details of Mr. Gardiner's views and narrative, we remark that we fully agree with his explanation of the causes of the great and fatal war, as well as with his representation of its incidents until 1620. His description of the position taken by England during the period 1621-1624 is particularly lucid and to some extent new. During those years James I. sought by means of negotiations with Spain to alleviate the lot of his son-in-law, and although these negotiations were fruitless, they are nevertheless highly interesting on account of the mystery which environs them, and of the peculiar attitude assumed by Spain while they were on foot. When James perceived the fruitlessness of the negotiations with Spain, he desired to obtain by force what he had been unable to obtain in a peaceful way, and with this view entered into negotiations with Denmark and Sweden touching the conclusion of an alliance. The distinct portrayal of these negotiations, which have been hitherto little regarded in German works, and that of the contemporary position of France, are among the most instructive parts of the book.

Mr. Gardiner devotes special diligence to a minute and distinct characterisation of the three prominent men of the Thirty Years' War—Richelieu, Gustavus Adolphus, and Wallenstein.

A brilliant recognition is awarded to the statesmanlike abilities of Richelieu, while there is no word of blame for his hostility to the French Huguenots, which is considered to have been imperatively demanded by the interests of France. His skill and profound insight in the choice of allies, who were sometimes distasteful even to himself, but whose power and consequence he wished to make serviceable to France, are depicted with great acuteness and perspicuity, so that we cannot fail to acknowledge fully the justice of the contrast drawn between his sagacity and the French policy under Napoleon III.

On the other hand, it is with a certain cautious anxiety that Mr. Gardiner delineates, not indeed the character and abilities, but the plans and views of Gustavus Adolphus. The character and abilities of this king are open to the world; there can be no essential difference of opinion respecting either on an impartial examination. But the matter stands differently if we attempt to pass sentence on the intentions of this eminent man, whose early death concealed his plans from the knowledge and judgment of the world. Mr. Gardiner thinks that the plan of Gustavus Adolphus was to unite the

Protestant states of North Germany into one confederation, of which he wished to assume the guidance and leadership. From this motive he explains the military tactics of this king after the battle of Breitenfeld, especially his determination to obtain a firm footing in Germany, instead of pushing on to Vienna, and his consequent resolve to march to the Rhine. It is difficult to advance anything decisive either for or against this conjecture of Mr. Gardiner; it only occurs to us that in a conference with the French ambassadors in 1631, Gustavus Adolphus asked them what would be said in France if he should proclaim himself King of Franconia, one of the German circles which was pre-eminently in the possession of Catholic ecclesiastical princes. This seems to indicate that, if he had the design of subjugating a part of Germany, he wished to be absolute master thereof, and not to assume so unsatisfactory and powerless a position as that of Protector of North Germany. On the other hand, it is certain that his ambition would hardly have been satisfied with so limited a possession as that of the diminutive Franconia, and that his question to the French ambassadors only indicated a part of his aspirations, and that consequently his real design was bent on the founding of the lordship over North Germany suggested by Mr. Gardiner. Mr. Gardiner does not overlook the difficulties which would have lain in the way of this design, owing to the insubordination of German princes and towns; and he remarks, with perfect justice, that it was the good fortune of Gustavus Adolphus to fall before he was ruined by these difficulties. "It may be, after all, he was happy in the opportunity of his death."

In his representation of Wallenstein Mr. Gardiner, as it seems to us, has surrendered himself to the influence of Ranke's writings; and he has not, therefore, the words of censure which we expected for the last period of Wallenstein's career. With fine tact he points out Wallenstein's *un-German* origin, and the consequences which this had upon the share which he took in the murderous strife; and we think the grounds are justly indicated on which Gustavus Adolphus, in 1630, refused to enter into the negotiations with Wallenstein which the latter so ardently desired. But what Mr. Gardiner relates concerning the career of Wallenstein after the death of Gustavus Adolphus, with regard to his desire to play the part of a kind of peacemaker, corresponds a good deal to the representation hitherto in vogue, especially that of Ranke; but it is not in harmony with the real facts, which have not yet been made public through the press. Wallenstein wished to play the traitor to his Emperor, and to that end commenced negotiations with France in 1633, in accordance with which Lewis XIII. was to bind himself, on the payment of certain subsidies, to support Wallenstein in his insurrection against the Emperor, and in the acquisition of Bohemia, which was the object of his desires. The Emperor and Spain were willing to pay a great price for Wallenstein's fidelity; he rejected their offers, however, for his ambition was bent on higher things. Spain had always taken Wallenstein's part

at the Imperial Court, both in 1630 at Regensburg, and in 1633 when suspicions were already entertained respecting him at Vienna; and Count Oñate was purposely sent, at the close of 1633, to Vienna in order to dissuade the Emperor from his distrust of Wallenstein, and to place the relations between both upon a friendly footing. With this charge and with this design Oñate set out on his journey to Vienna at the end of 1633, but immediately after his arrival he associated himself with the most vehement opponents of Wallenstein, because he was convinced of his guilt and intrigues. To some extent there are sufficient proofs in favour of our assertions in the publications of Helbig and Fiedler, and in the documents of Feuquière, printed in the seventeenth century. But in spite of all, Ranke saw in Wallenstein too idealised a nature to accuse him of a long previously concerted treachery for purely selfish interests, and thus also Mr. Gardiner's sentiment respecting the catastrophe of Wallenstein became more favourable to that Bohemian condottiere than he deserved. This difference between our view and that of Mr. Gardiner is no disparagement of the latter after the explanations we have given, since the catastrophe of Wallenstein is still under the consideration of those minor Austrian or Bohemian historians who alone, after all, are in a position to throw full light upon the subject.

In conclusion, we welcome in Mr. Gardiner's *History of the Thirty Years' War* a truly excellent work, and we wish that by means of a good translation it may become the common possession of the people among whom the great conflict raged.

A. GINDELY.

NEW NOVELS.

Mr. Smith: a Part of his Life. By L. B. Walford. In Two Volumes. (Edinburgh: William Blackwood & Sons, 1874.)
The Deceased Wife's Sister, and My Beautiful Neighbour. In Three Volumes. (London: Richard Bentley & Son, 1874.)
The Village Surgeon. By Arthur Locker. (London: Sampson Low & Co., 1874.)
Hope Meredith. By the Author of "St. Olave's," &c. In Three Volumes. (London: Hurst & Blackett, 1874.)

ADMITTING that a society for the repression of novels would be as ineffectual as a society for the repression of hydra's heads, and that novels are one of the evils brought in the train of an advanced civilisation, we would yet venture to suggest that means be adopted for cutting away the diseased excrescence of criticism which has grown so rapidly on the surface of a necessary institution, and would in a few lines submit to consideration a system for reconciling that variance of opinion which leaves no romance without a champion to declare it a masterpiece, for relieving that monotony of phrase which endows the shallowest story with psychological introspection, meditative analysis, and the like notable and high-sounding qualities, and for saving an expenditure of time and temper which is satisfactory neither to author, reader, nor critic. It is well known that in considering the merits of most modern works of fiction, the first object is to indicate

their class by reference to the standard author, or class of standard authors, from whom they are imitated or stolen, the second, to estimate the ingenuity of the imitation or theft: and that neither of these is at present effected by a uniform process. We would suggest that the class be shown by dividing the better sort of novelists into four battalions, arranged according to their fitness for imitation, and each having for peculiar sign a dash, a cross, a dagger, or an asterisk. The first and scantiest company would include those writers who stand at the ends of the long file from Petronius to Mr. Anthony Trollope, and who, as being too ancient or too modern, are generally held unsuitable for the purpose; in the second would be placed the subtlest master spirits of fiction, such as Goethe, Balzac, Hawthorne; in the third, those who burrow less deeply in the human heart, represented in England by Jane Austen and Thackeray, in France by the Abbé Prévost and George Sand; and in the fourth, the authors who bear upon their sleeve the secret of their literary success. Having affixed to the book under review the symbol of its class, the critic might then award marks to it on the ordinary system of examinations, and according to a fixed scale for observation, humour, fancy, style, and so forth; and though the difference between the awards of the gushing and of the cynical reviewer would be as large as before, yet the gush and cynicism would now be expressed in commensurable terms, and the numerical equivalent of common sense could speedily be calculated by an intelligent reader or advertised by an honest publisher. But as such innovations as this are necessarily things of an indefinite future, we must at present be content to proceed along the beaten track of criticism.

And it is agreeable at starting to light upon a book with so many claims to originality as *Mr. Smith*. In humorously describing homely scenes with painful minuteness, it resembles a picture by Dow or Van Ostade, but the style is a serious obstacle to the enjoyment of this minuteness, being simply a succession of barks. There is a Helen in the story—a fair Helen—Helen Tolleton, the beauty of Eastworld. And there is a sort of Paris. Paris is short, stout, grey. He has ten thousand a year. His name is Smith. People had sometimes called him Brown. It had hurt him. He would not himself have hurt the feelings of man, woman, or child. His name was not the only objectionable part of him. When his house at Eastworld was building, the butcher thought he would be a family. He had constructed rooms that meant roast beef. He had furnished rooms that meant saddles of mutton and sweetbread. And then came a single man. Plain John Smith. The book has no Oenone. But Carry Tolleton thought that fair Helen might leave the old fogies to her. And Lily Tolleton had an eye to the prize. The Tolleton girls were not respected at Eastworld. They had chattered and flirted, and men had encouraged and admired. They had grown reckless, and came to be talked about. That was their history. Mrs. Hunt, the doctor's wife, determined to oppose them. She formally consecrated her daughter

Maria to Mr. Smith. Maria Hunt was not captivating. She was a spotty-faced thing like a ferret. But Helen was soon left to conduct the siege alone. Needless to say that Mr. Smith was stricken with her charms in a middle-aged, helpless way. She then confessed a desperate flirtation of the past, and his idol for a moment shook. While it was staggering the siege was raised, for Helen lay ill at home dreaming of bygone conquests, of Lance and Buckley and Gordon and hosts of others besides poor Walter, who really cared more for her than the rest together; how some had her hair: some the flowers she had worn: some, her gloves: and one or two, even letters; and laughing when she recalled visions of doleful visages saying farewell over faultless neckties and unimpeachable shirt-fronts, of the pushing forward and hustling for her smiles, of the gloomy sighs breathed in the back-ground, the jealous looks, the little mean insinuations, the frown of the Colonel, the weak sneer of the subaltern. And when she had done dreaming Mr. Smith proposed. And when he had proposed he died.

The heroine of *The Deceased Wife's Sister* addresses herself to a select audience. Not for you, O marble-hearted woman smiling at her passion, does she write the narrative of her love for her sister's husband. But she envies your smiles. It is something, it is everything, in this world of blooming flowers and broken hearts to be born without instincts that grow mad in the light of love like man in the light of the moon. Give her your dispassionate nature. Give her your heart in which love can make no music, misery no madness. Give her the innocence of your immobility. She wants no joys, for joys fill the past with fallen rose-leaves, whose breath is full of the bitterness of death and the melancholy of decay. Those who get beyond this apostrophe will be introduced to the heroine in all her moods: whether scenting decay in the wind or watching the evening as it fills the air with a stillness which she can hear, and which seems to her a symbol of eternity: whether in her favourite character of a fairy-witch filled with tremulous sensibility, which emits a quaint music from her heart whenever it is smitten, or in that of an intellectual Aunt Sally: whether playing at chess with abstracted irrelevance, or declaring that defiance is her weapon, uncompromising, thirsty defiance. Strange creatures, too, are to be met by the wayside. There is a lady who bandolines down her hair with a scalp-like smoothness; a youth who is gifted with a *retroussé* whistle; a gentleman whose face takes a severity of beauty as he sings with his hand reposing on the back of his deceased wife's sister's neck, his gleaming eyes fixed on the deep sky, and his fingers trembling in sympathetic unison with the impassioned accents of his rich, deep chant. The sentiments of this book cannot fail to disgust. We are not disposed to waste hard words on a book which is possibly intended to prepare the way for a romance on the Contagious Diseases Act. But it is a feculent production.

My Beautiful Neighbour is by the same skilled hand, and shows the same love of nature, the same chaste imagination, the

same yearning for a spiritual life. The air was tart with a smell of salt and seaweed, athwart the moon passed the sombre shadow of a bat, the sea was singing her pauseless undersong, the beating of her mighty heart could be heard amid the purring of the breakers as they creamed beneath the moonlight on the porous beach: when a phantom with yellow hair and an alabaster neck came forth to woo the slumberous air, with looks like liberty incarnate, with freedom in her royal gestures, pliancy and power in her step, with an exquisite form undulating to her thoughts like the shadow of a dryad seen in a breezy pool. She appeared to a student whose life was a virgin blank, and bore no strange characters drawn by fate, no pierced heart, no weeping cupid, no stain of tear, no pensive profile disturbing its white purity; and she appeared to his Italian tutor who had translated Apollonius Rhodius and Coluthus Lycopolitas, and who shone by the borrowed light of letters rather than the luminous atmosphere of the imagination. She married the student and murdered the tutor. She was mad.

Matthew Allardyce, "*The Village Surgeon*," writes a diary which is only one degree less silly. He addresses it in the form of sententious remarks to an imaginary being called his Better Self, who acts pantaloons to Mr. Allardyce's clowning, and who, were he not too gentle a shade to protest against hard usage, might express himself in this strain: "My friend in motley. You offer three reasons for compiling a diary, a reason meteorological, a reason theological, and a reason chemical; but I could disclose a weightier reason to dissuade you therefrom, the reason intellectual that you are utterly incapable of writing it. The plea that you have invented a sympathetic ink is worthy, I acknowledge, of a moment's consideration, for I know of nothing else that could be expected to sympathise with the doings you think fit to chronicle, with your habit of wearing mocassins and your habit of wearing boots, with your hours for blowing your nose sonorously and your seasons for leaving it in repose. It is no excuse that your budding taste for literature was discovered by the daughter of a drunken musician with a marked genius for the banjo, and tenderly fostered by her, until the beautiful demon flew on you with streaming hair and a knife, and you fled to Salt Lake City to avenge yourself on the sex. And why you did not remain there as an elder and distribute your diary to your wives for curl-papers: why you should have burst on a quiet English village with Indian costumes, and scowls, and addresses to lovely but haughty beings and to their "blueish-grey optics," and bitterness masked under a covering of persiflage, and dreams of marrying a dowager, and contempt for the Game Laws: why you should have presumed to dismiss the wicked valet of an invalid and establish him as proprietor of a coffee-shop, holding the risk of his poisoning an infirm old man to be of greater moment than the risk of his poisoning a considerable number of coffee-drinkers: these are problems which I confess myself unable to solve. I beg to resign my distinguished office. And in resigning it I would warn you not to talk overmuch of your sympathetic ink, for the

margin of your book is as wide as the text, and a curious reader might be tempted to warm the page with a view to discovering hidden writing: and when your book is near the fire the temptation may be too strong for readers who are not responsible for its safety to the circulating library."

Having waded through the slough of the last three books, we again touch hard ground in *Hope Meredith*. For though there is sensational bombast in it, though the daughter of a noble English family secretly marries a bank clerk, though the bank clerk is found to be a fugitive criminal and his wife keeps her secret till the lightning strikes her dead, yet *Hope Meredith* is a work of uncommon interest and shows a rare grip of character. The first glance will alarm a timid reader. Here and there a vampire will lift its wings and slowly move away, a terrible secret will come stalking forth, somebody will be chained to the dead body of the past, and Madolin Lauderdale will cry "Ha, Ha," like the war-horse perpetually quoted. But there is an exquisite painting in miniature of a child hospital-nurse, Hope Meredith, the only being in the world that the solitary Madolin will bring to Nunthorpe Chase, where the young middle-class girl is allowed to wander under the boar's tusks and deer's antlers that hang in the entrance-hall, among the suits of armour, Indian cabinets, and eastern curiosities that lie in the picture-gallery, sketching the proud Lauderdale ancestors, enjoying the proud Lauderdale hospitality, receiving the proud Lauderdale kiss. Miss Griselda Lauderdale objects to the intrusion, for the elder inmates of the Chase are staunch Tories, and next after the Bible they venerate the *Standard*. So Griselda is patient and waits till a lover comes from Canada, wooing sweet Hope and neglecting proud Madolin, till Madolin grows jealous and fears that Hope has learned the secret, and until the convict husband returns. Then all the good dies out of Madolin: she lies, she forges, and she steals. This devastation of a haughty spirit is natural enough. Madolin had lived a lonely life for seven years, and who can tell what a weary soul may do when harried by jealousy and despair and the *Standard*?

WALTER MACLEANE.

FRENCH AND GERMAN SCHOOL-BOOKS.

A Compendious Dictionary of the French Language. By G. Masson, Assistant Master and Librarian in Harrow School. (London: Macmillan & Co.) The two most striking features of this work are the historical and literary tables with which it commences, and the etymologies appended to nearly every French word. The principal table contains, in seventeen pages, a conspectus of French literature down to the present time. As in M. Masson's editions of French classics, the purely literary part is supplemented by "Synchronisms," i.e. contemporaneous incidents in political history, and in the literature of other countries. Such summaries are apt to be very dull, uninteresting reading; but M. Masson has a happy knack, by means of apposite and suggestive headings, of marking out in a very small space the chief groups of writers and their relations to the intellectual movements of their time. Even leading newspapers are not forgotten. Among the other tables, one of the most interesting is the list of Chronicles and Memoirs. Here and there the name and date are supplemented by an epigrammatic description, "a jewel five words long,"

such as Chateaubriand's character of St. Simon—"écrit à la diable pour l'immortalité;" or Ste. Beuve's of De Hérault—"Gil Blas supérieur, Figaro sans mauvais goût." As to the dictionary itself, the etymologies are most valuable, and M. Masson's name is, of course, sufficient guarantee for its accuracy; but we cannot help regretting that he has made it so concise. To write a dictionary on the principle of merely giving English equivalents for French words is an almost hopeless task. Take, for example, the word *reconnaître*. There are no fewer than ten English renderings given, including *visit*, *challenge*, *discover*. Would it not have been better to state distinctly the primary meaning and the chief derived uses, with some indication of the train of thought leading to them, and leave the student to supply the English equivalent that suits the passage? In a case like that just quoted, the mischief is not, perhaps, very serious; but there are instances where the absence of grouping might easily lead to want of clearness. Thus, under *se prendre* we find, *be taken*, *be caught*, *impute*, and three or four other meanings. A school-boy looking for *s'en prendre à* would be sadly puzzled, though the meaning he wants is actually there. Again, it would be possible, without greatly increasing the bulk of the book, to give so much of the history of words as is necessary for a clear understanding of their present meaning. Under *fronder*, *frondeur* we should like to find some allusion to the War of the Fronde, and to the *jeu d'esprit* to which its name and the present application of the word are due; under *cordons bleu*, not only a *first-rate cook*, but also some reference to the Order of the Holy Ghost, and to our own *blue ribbon*; under *encyclopédiste*, *polytechnique*, their associations with eighteenth century literature and the great scientific school of Paris. Of course there must be a limit to the size of a dictionary, but we should be grateful to M. Masson if he would give us, what few men are so well qualified to undertake, a slight enlargement in the direction we have indicated.

The Campaigns of Napoleon (Thiers). With notes by E. E. Bowen, M.A., Master of the Modern Side in Harrow School, late Fellow of Trinity College, Cambridge. Vol. I. Arcola. (Rivingtons.) Mr. Bowen's object has evidently been to provide for higher classes a French reading-book likely at once to interest them, and to encourage the application to modern literature of the habit of exact and critical reading which is perhaps the most valuable result of classical studies. With so wide a field to choose from, it is nearly as hard to select a book as to annotate it. Mr. Bowen vindicates his choice in the preface, and points out how much may be learnt from a well-told campaign. Military history and geography are sure to attract a schoolboy, and where battles and politics are closely interwoven, he is imperceptibly led on to take an interest in the more serious parts of historical study. And for this purpose, probably, no better subject could have been selected than the French Revolutionary wars, which, besides their intrinsic interest, bring out incidentally in such sharp relief the characteristics of the *ancien régime* throughout Europe. The notes, though not numerous, imply a good deal of research, and are very suggestive both to teachers and pupils, without ever giving too much assistance. Those on the military operations, showing the mistakes of Napoleon's opponents, calling attention to his strokes of genius, and reviewing from time to time the situation and the various courses open to the two parties, are just what is wanted to keep a boy from vague and careless reading. The criticisms of Jomini and other writers are given, where necessary, pointedly and concisely, and the maps, of which there are several, are clear and to the purpose. Again, notes like the following are capital: "It is a well-known maxim that councils of war never fight [Salamis, Plasey]." Throughout the book one traces the hand of a good teacher, who insists on having the

book he is reading perfectly understood, and never loses an opportunity of adding to the general information of his pupils.

Souvestre's *Un Philosophe sous les Toits*, edited by Léonce Stiévenard (Longmans & Co.), is intended to meet the wants of candidates for the Cambridge Local Examinations. It is a pity that the Syndicate should have chosen for the purpose a book which, though charmingly written and delightful after-dinner reading, contains but little to stimulate a pupil's thinking powers, or to add to his stock of information. In girls' schools, and in boys' schools where but little classics are studied, the French text-book forms a considerable part of a young person's intellectual food for several weeks or months, and should, therefore, furnish more solid reading than the chit-chat of a Parisian *flâneur*, however unaffected and high-principled. In the edition before us, such of the notes as explain the literary and miscellaneous allusions in the text are carefully done, and seem likely to be useful; most of the others are simply translations of harder passages, and will too often only save the trouble of thinking.

A French Grammar based on Philological Principles. By H. Breymann, lecturer at Owens College, Manchester. (Macmillan & Co.) The author is anxious to base the teaching of the French language on historical and comparative principles. He fully realises that modern languages are often taught in such a way as to yield but little fruit in the way of intellectual training, and proposes to remedy the evil from the point of view rather of a comparative philologist than of a scholar. The present volume contains a tolerably exhaustive Accidence, supplemented by philological notes and illustrations, which are wisely separated from the grammatical rules and paradigms. The division of the verbs into weak and strong conjugations, as in German and English, is adopted on the authority of Diez and other good writers. The crucial test is the formation of the preterite definite: verbs which, like *parler*, *vendre*, &c., add a syllable to the root, being considered weak, while those which, like *croire*, *venir*, lengthen or accent the root-vowel, are called strong verbs. This part of the book is well and fully done; some other parts, as, for example, the Introduction and the chapter on numerals, resemble, perhaps inevitably, an abridgment of Brachet, already familiar to English readers in the Clarendon Press Series. In the syntax, which is to follow, Mr. Breymann will find the field less occupied. The general arrangement is hardly clear enough; a good deal of space might have been saved, and reference facilitated, if it had not been thought necessary to give every verb a page to itself. The whole book has too much the air of an *édition de luxe*.

Companion to Schiller's "Wilhelm Tell." By H. Müller-Strübing, and Rev. R. H. Quick, M.A. 2nd edition. (London: Nutt. Harrow: Clarke.) This book meets a real difficulty in the teaching of modern languages. Few boys begin German till they have learnt the elements of grammar and of the art of translation in some other language. Thus, in attacking German with the dictionary, their intellects go faster than their fingers, and much of their labour is lost time. Moreover, if the dictionary is small they find too little information, and if it be large they are apt to lose their way. Unfortunately, too, there is no German-English dictionary of the Liddell and Scott type. The plan adopted by Messrs. Strübing and Quick is to give the meaning of each word, often with some suggestive remark on its derivation or its English cognates, and to leave the construction to the student. Thus in the first few pages we have the connexion of *Dorf* and *thorp*, the steps by which *laden* comes to mean *invite*, the French equivalent for *es steht ihm gut*, and similar hints. It is much better for a boy to learn such things and be questioned on them by his master, than

that he should be told them in class. With aid of this kind, the preparation of a German lesson becomes a definite task, and half the troubles of schoolboys and schoolmasters arise from indefiniteness. The vocabulary is carefully compiled, and is followed by an alphabetical index, by which the note on any word can easily be found. Besides this, there are constant references from note to note, so that a pupil can easily be practised in what is, after all, the best way of remembering words, to associate them with the passage in which he first met them. In addition to the vocabulary and the historical introduction, there is a very brief German accidence, sufficient to enable a boy to proceed at once to construing, leaving details to be mastered at leisure.

The Public School Series, by H. Van Laun and V. Plegnier (Strahan & Isbister), includes a series of Readers, a small primer, an accidence and a syntax, each with exercises. They are all furnished with vocabularies at the end, and the exercises are always preceded by selections of French sentences illustrating the rules. The rules in the syntax are clear and full, and the plan of the book convenient, but we cannot help regretting that the arrangement does not conform more closely to that of good classical grammars. The full treatment of the Subordinate Sentence is a most useful intellectual discipline, and, though French is an analytic language, the use of *à* and *de* has so much in common with that of the Latin genitive and dative, that it is worth while to bring out the similarity, even at the risk of diffuseness. And few things are more important than to show a boy how certain great principles of grammar run through several languages. Except for this, which in our opinion is a real defect, but which is common to so many French grammars, the series is thoroughly satisfactory; among other good points that strike us, the exercises combine a number of well-selected scraps from good authors with the more commonplace materials of an ordinary exercise book.

Contanseau's Middle Class French Series. (Longmans & Co.) Eight little books in stiff covers and at a very low price are sure to be welcome to parents who scrutinise their school bills minutely. The Grammar is in two parts, accidence and syntax; the rules are tolerably simple and clear, but there is no effort made to bring out principles, and to put the matter into the same shape as the syntax of other languages. The elementary exercise books are good, being carefully graduated and provided with complete vocabularies. The fourth, in which continuous passages are given, is less satisfactory. The passages chosen are childish stories, instead of sterling extracts from standard English authors, which are often quite as easy, and are valuable for other reasons. The notes, too, instead of being suggestive hints or references to the syntax, merely give the French equivalents of the English words. The series also includes a *Delectus* and First Reader.

H. W. EVE.

NOTES AND NEWS.

THE first part of the Corpus of Greek Inscriptions, which the Trustees of the British Museum decided on publishing under the editorship of Mr. Newton, the Keeper of the Classical Antiquities, is almost ready for publication. This first part embraces all the inscriptions in the Museum from Attica. The text of it has been prepared by the Rev. E. L. Hicks, formerly Fellow and Tutor of Corpus Christi College, Oxford.

MR. HENRY SIDGWICK's long-expected book on the *Methods of Ethics* is at press, and may be expected shortly. It is a little difficult to gather from the preface what is the exact purport of the book. It is not metaphysical or psychological, or historical or critical, or dogmatic or practical;

and it "avoids" the enquiry into the origin of the Moral Faculty. The area of enquiry thus narrowed is thus described:—

"It claims to be an examination, at once expository and critical, of the different methods of obtaining reasoned convictions as to what ought to be done which are to be found—either explicit or implicit—in the moral consciousness of mankind generally: and which, from time to time, have been developed, either singly or in combination, by individual thinkers, and worked up into the systems now historical."

MESSRS. H. S. KING & Co. will publish shortly *Joseph Mazzini: a Memoir*, by E. A. V., with a portrait of the author. Two Essays by Mazzini will be appended to the work, entitled "Thoughts on Democracy," and "The Duties of Man." The book is, we learn, "dedicated to the working-classes by Mr. P. A. Taylor, M.P."

THE Council of the Camden Society have selected as publications for next year—1. Wriothesley's Chronicle of England from the Accession of Henry VII. to the first year of Elizabeth. Edited, with an appendix containing the official documents relating to the trial of Anne Boleyn, by W. D. Hamilton. 2. The Autobiography of Lady Anne Halkett. Edited by the late J. G. Nichols. 3. Letters addressed by Dr. Prideaux to Secretary Ellis, 1674—1722. Edited by E. Maunde Thompson.

LIEUT.-COL. W. E. MARSHALL, the author of *A Phrenologist among the Todas*, is engaged on a work to be entitled *The Scientific Aspect of Polyandry*, embodying the results of lengthened travel and sojourn among the races occupying the Western Himalaya mountains.

MESSRS. WILLIAMS AND NORGATE will shortly publish *The Philosophy of "Hamlet"*, by Mr. Thomas Tyler. New solutions of the more important problems presented by the character and conduct of Hamlet will be given, based, in part, on a comparison of the later text with that of the quarto of 1603.

MESSRS. BORNTRÄGER, of Berlin, have just issued a German translation of Mr. Tennyson's *In Memoriam*, from the pen of Mme. Agnes von Bohlen.

M. GUILLAUME GUIZOT has presented a marble bust of his father, by Robinet, to the French Academy. The public reception of M. Mézières, successor of M. Saint-Marc Girardin, is fixed for December 17. He will be answered by M. Camille Rousset.

THE *Nation* records the premature death of Mr. W. A. Wheeler, Assistant Superintendent of the Boston Public Library, and an energetic helper in the compilation of its catalogues. At the time of his death he was engaged upon a "Dictionary of Shakespearian Reference."

Polybiblion announces that the Paris Japanese Society, which was founded after last year's meeting of the International Congress of Orientalists for the furtherance of Japanese, Chinese, Tartar, and Indo-Chinese studies, is in a flourishing state, and has about sixty life members. The young Society also possesses the nucleus of a good library, and its monthly meetings are well attended.

THE last number of *Trübner's American and Oriental Literary Record* contains the fullest account we have seen of the International Congress of Orientalists held in London last September. We hear that Professor Douglas, of the British Museum, has been commissioned by the committee to publish the Official Report of the Congress.

The *Levant Herald* announces that Mehemet Fevzi Effendi, Chief Secretary of the Ministry of Finance, has just published the third volume of his *History of Turkey*. This volume relates the events of the reigns of Murad II. and Mahomet II.

WE regret to have to record the death (which occurred very suddenly on Friday, November 13) of Mrs. Hooker, the wife of the Director of Kew

Gardens and President of the Royal Society. Her loss will be much felt among a numerous circle of scientific friends which was at least European in its extent. During her youth she spent a good deal of time at Cambridge, where her father, Professor Henslow, held the chair of Botany. She was extremely attached to Dr. Whewell, and was fond of repeating stories which illustrated a side of his character curiously different in its gentleness from that which the outside world attributes to him. While living at Kew, Mrs. Hooker's keen sympathy with scientific pursuits was shown by the assistance which she was always ready to give in the work prosecuted there, and which too often gave no indication of the self-denying hand which had executed it. Her translation of Le Maout and Decaisne's *Traité Général de Botanique* was a laborious task which she willingly imposed upon herself in the interests of botany in this country. Her great conversational powers and the brightness and clearness of her intellect will be missed greatly among those who have been in the habit of seeing her at Kew—and not the least by the younger scientific men, who in many ways experienced her kindness.

ONE of the principal publishing firms at Leipzig, B. G. Teubner, has issued a paper to explain the reasons of the great increase in the price of books in Germany. It would appear that at Leipzig the wages paid to mathematical compositors have risen during the last year 100 per cent., those for classical compositors 40 to 50 per cent. But what is still more serious is the high payment that is now required for corrections. German authors seem to send their manuscript to the printers in a perfectly disgraceful state. The printers have the greatest difficulty in deciphering what is sent to them, and hence the first proof-sheets are full of the most troublesome mistakes. Many authors seem to look on the first proof sent to them as a kind of fair copy, on which they add and change *ad libitum*. The result is, as the firm of Teubner points out, that the expenses are doubled and tripled; and as the author declines to pay for the additional outlay caused by his own carelessness, the extra charge must of course be made up by the price of the book. It is strange that German publishers should not have hit on a solution of the difficulty, adopted long ago in England, viz., that everything beyond a certain sum for corrections is deducted from the author's honorarium. Or are we to suppose that in Germany the honorarium is in most cases so small that nothing can be deducted from it? We are also told that strictly scientific works have at present a much smaller sale in Germany than they used to have, so that for that reason too the prices have been raised. It is a fact, nevertheless, that German publishers undertake to bring out books at their own risk which no English publisher would touch. What firm in England would have accepted Corsen's work on the Etruscan language, or even Curtius' *Principles of Greek Etymology*? Yet the latter work has passed through four editions, and the sale of Corsen's first volume is said to have been far larger than could have been anticipated. Again, we see that M. Teubner advertises a new edition of the *Scholia Græca in Homeri Carmina*, by A. Ludwich. In England the same Scholia will soon be published by Dindorf, and, as it would seem, in a much more complete form. But in England such an undertaking could never have been thought of by a private firm, and the expenses of the English edition will have to be defrayed by the Clarendon Press.

AT the suggestion of Professors Friedländer and Mommsen, the Royal Academy of Sciences at Berlin have announced that in the event of a suitable person presenting himself for the undertaking before the end of March, 1875, they will supply funds necessary for the printing and editing of a catalogue of all the Bithynian coins struck before the close of the third century after Christ. The catalogue will have to be drawn up

with reference to London and Paris collections, and must be arranged with due regard to chronology, topography, weight, &c.

THE German papers announce the death of Heinrich Brockhaus, the head of the great publishing firm at Leipzig. He was not only the greatest German publisher—the last catalogue of his house amounts to about 2,400 numbers—but he belonged to that old, and now almost extinct race of booksellers who raised their trade to the dignity of a liberal profession, and used their influence in creating and fostering a national literature. He was not only a patron of literature, but could meet the most eminent authors on terms of perfect equality. He had received the best education, and always kept pace with the advances of science and literature of the day. He was a great traveller, and there are few cities in Europe where some friends will not mourn for him. He took an active part, as a liberal politician, in the struggles for German unity and constitutional freedom. He died in his seventy-first year. His firm is now represented by his two sons, Dr. E. Brockhaus and R. Brockhaus.

THE library of M. Guizot will be among the sales this season at the Hôtel Drouot.

THERE has been lately discovered, in the War Office at Stockholm, a manuscript work composed by special order of Charles XII. to give an exact description of the military successes of Sweden upon the Continent. The work is in twenty volumes, and contains more than 200 pages filled with drawings representing the flags taken in the battles and sieges up to 1697.

DENMARK seems to be losing her great writers in exact chronological order. In 1872, Grundtvig, who was born in 1783, died; a few weeks ago Bødtker, who was born in 1793, passed away; and now the next oldest Danish poet has followed in their wake. Just Mathias Thiele died at Copenhagen on the 9th instant, after living for many years in complete seclusion and weak health. He was born on December 13, 1795, and entered the University of Copenhagen in 1816, and was already producing such good poetry that the enthusiastic Baggeresen received him as one of his poetic "sons." He travelled all over Europe, became Keeper of the Royal Collection of Engravings, and Librarian to the Academy of Arts, and was sent to Rome in 1844 to take possession of Thorwaldsen's remains. He wrote two successful dramas, *Thyre Bolde* and *Claus Richman's Treasure*, and several collections of lyric poetry, but his chief contributions to literature are in prose, and include a life of Thorwaldsen and a study of his works, which were begun in 1831, but not published in full till 1850. He was also the author of a collection of Danish Popular Legends (*Folkesagn*) and of a volume of letters from England and Scotland, dealing with our institutions as he saw them in 1838.

ONE of our Swedish contemporaries states that the centenary of the introduction of potatoes into Europe is approaching. It was towards the close of 1774 that Parmentier first succeeded in producing home-grown roots in France. It seems characteristic of the madness for festivals that just now distinguishes the northern races of Europe, that our Swedish friend suggests the propriety of getting up a great Potato Jubilee, more especially as the introduction of potatoes into Europe is generally attributed to Sir Walter Raleigh.

THE recent sympathy shown for Denmark by the nations speaking our language has given a great impetus to the study of English literature among the Danes. Especially our periodical press is made a subject of study, and the practice of translating articles from English and American magazines is rapidly increasing. For instance, *Naer og Fjern* for November 15 gives a version of Bret Harte's *Fool of Five Forks* from *Macmillan's Magazine*; and *Fædrelandet* for November 13 translates in full Mr. Edmund Gosse's recent

article in the *Cornhill* on the Danish National Theatre, with an editorial note saying that the paper "is written with so much warmth, and, in spite of some mistakes and misapprehensions, contains so much true and graceful criticism," that it will certainly be read with pleasure.

AMONG the latest presents for children with which the ingenious Santa Claus is careful to load his winter sledge, must be counted the Christmas numbers of the magazines. He does not, indeed, envelope these gifts with delightful mystery as of old, nor surreptitiously drop them into chimneys warm with the smoke of yule-logs, nor secretly place them in the pendulous stocking; he even gives early notice of their preparation by earthly agencies, and allows them to be presented long before custom suffers him to harness his reindeer and take his midnight ride abroad, and he is content that their pictorial ivy and holly shall be withered when the festival of Frey arrives. But as a recompense for this he exerts miraculous skill in snowing up talkative travellers, impeding trains of communicative passengers, stirring the memories of the old inmates of workhouses, and otherwise facilitating the narration of moving accidents by flood and field. Foremost among his prophets is Mr. B. L. Farjeon, who writes the Christmas annuals of *Tinsley's Magazine*, and who has this year composed a graceful allegory called *The King of No-Land*. It is the tale of a Prince Florestan of fairy-land and his wanderings in the kingdom of flowers with three small fiddling maidens for companions, and may be read by children on the surface with much delight, and by their elders a little deeper with not less pleasure. And notice the power of Santa Claus. Even the venerable Sylvanus Urban, Gentleman, does not disdain to quit the arm-chair from which he has gossiped to the world for a century and a half, and despite sundry rheumatic twinges to wave his wand with the grace of a columbine till the literary familiars assemble to do his bidding, to write of pixies' courts and sugar-plum houses, of yeoman beetles and spiders-at-arms and wasp judges, calling their Christmas work *Like a Snowball*. And having made you this seasonable offering and prayed you, his masters, to be merrie, quot estis in convivio, Sylvanus returns placidly to his dressing-gown and slippers, and will doubtless make his periodical utterances with wonted equanimity.

THE publication of a work by M. Léon Walras gave occasion to a paper read by Professor Jevons before the Statistical Society of Manchester, at their meeting on Wednesday last, on "The Mathematical Theory of Political Economy." M. Walras speaks of Mr. Jevons as joint discoverer with himself of this theory, but having, of course, the credit of its first publication; and Mr. Jevons appears to have a high respect for the opinion of M. Walras. Mr. Jevons complains of the neglect of his doctrines by English economists generally, but enumerates many foreigners who have given some sort of assent to them. Here, however, Mr. Jevons is not sufficiently precise. There are three propositions to which assent must be given by any one who is, strictly speaking, an adherent of Mr. Jevons' doctrine. The first is that some portions of the pure theory of political economy can be efficiently presented in mathematical language. No person who is in a position to understand what is meant by this proposition can withhold his assent from it. The second proposition is that Professor Jevons has, by means of this method, made improvements in the theory of political economy. This must be granted by all who follow his work; although those who are conversant with the literature of the subject will know that the exposition of the laws of exchange by means of functional equations is nearly forty years old, and will probably think that his contributions to this work are not the most important that have been made. The third proposition is that those of Mr. Jevons' reasonings which claim to be subversive of important positions held by Mill, do actually succeed in subverting them. Mr. Jevons

does not distinctly state that any eminent economists have given in their adhesion directly to this proposition; and it is probable that few, if any, have done so. Curiously enough, another able writer has been tilting against Mill: the two have charged at Mill from opposite sides, and have fallen foul of each other. Professor Cairnes is astonished because Mill, instead of regarding his old doctrine of the Wages-fund as perfect, has introduced into it, to use Mill's own phrase, "the qualifications and limitations necessary to make it admissible." Professor Jevons, in support of the opinion that Mill's writings will be found to "consist to a large extent of ingenious sophisms," brings into prominence the statement that "already his exposition of the Wages-fund has been overthrown by Professor Cliffe Leslie." With regard to the whole of the wages-problem it may be said that Mr. Jevons and Mr. Cairnes in general see vividly each that class of considerations which the other almost ignores. Mr. Jevons devotes a considerable portion of his address to an examination of the sweeping condemnation of his account of utility with which Mr. Cairnes opens his last book. This book, otherwise so fascinating and instructive, is marred by a want of the sympathetic subtlety which enables a man to enter into the thoughts of those whose positions he believes himself to be assailing; and Mr. Jevons has no difficulty in showing that much of what is intended as an attack upon his theory of utility has no reference to the theory as held by him. Mr. Jevons' doctrine of "final utility," or of the relation that exists between the value-in-use of an additional unit of a commodity to a man and the amount of that commodity which he already has, is important even if it be not so new as he imagines it to be. His applications of it are striking and suggestive, and it happens that, if Mr. Cairnes had familiarised himself with them, he might have improved his new book in several regards. The address brings the two professors before us together. Professor Cairnes is graceful and sound. Professor Jevons is vigorous and original. Much of his inductive work is first-rate, and the address gives fresh evidence that the efficiency of his work for the abstract science of political economy is most grievously crippled, but is not destroyed, by his anxiety to prove that he has revolutionised the science.

WE give here some further extracts from the journalist's note-book we alluded to a few weeks back:—

"I reached London for the second time on Sept. 17, 1830, after nearly two years' absence. The perceptible changes wrought during that time were—the removal of Exeter Change and the widening of parts of the Strand; the removal of that great eye-sore Fleet Market and the erection in its stead of that of Farringdon; the advancement of the New London Bridge and the erection of the land arches over the old streets at the approaches; the throwing open of the inclosure in St. James's Park to the public; the completion of the new Post Office in St. Martin's le Grand; and the introduction of the new police and the carriages called the omnibus. At this period the new police system was exciting much disapprobation in the parishes into which it had been introduced, several parochial and other meetings being holden on the subject. The alleged causes of complaint were their being an unconstitutional half military force, the great expense they entailed, and their non-efficiency; to which was added that they were all or nearly all Irishmen."

At this time (as may be gathered from other occasional entries) evidences of the recent French revolution were visible in the principal thoroughfares and streets, and its popularity was visible in tri-coloured ribbons, watch-guards, pocket-handkerchiefs and other articles. Even the puffing hand-bills of some of the tradesmen, anxious to assimilate themselves to the prevailing hue of the time, adopted a tri-coloured border. Meetings and subscriptions to congratulate and aid them in their progress to freedom were called daily, and

the great movement in the French metropolis seemed to be as popular here as in Paris. At this time also a society met every Monday at the Rotunda, Blackfriars Bridge, which called itself the Radical Reform Association, at the head of which was Hunt, since member for Preston.

"Was introduced at the Coal Hole by its owner, Rhodes, to M. Silvain, the (so announced) Paris dancer, who came over with the company of Parisian dancers to perform for Bunn at Covent Garden and Drury Lane. M. Silvain, in plain English, is an Irishman, and his real name Sullivan, which, especially with an 'O' prefixed, would never, it was shrewdly supposed, have gone down with John Bull. Sullivan seemed rather an intelligent chap, considering that professionally he made more use of his heels than his head; said he was born at Cork, which place he left early in life, and had lived the greater part of his time on the Continent. He brought his mother to reside with him in Paris, but she, poor woman, whether unable to 'catch the accent,' as her countryman Curran once said of a gaping Irishman with his tongue out, staring at the pictures in the London print-shops, or more probably that with the natural feeling of her class and sex, in Ireland she wished to live and die and be buried, she however preferred to return here, and lived at the time somewhere near Dublin, her son supported her declining days in comfort."

"Had a visit from Captain Glasecock at my lodgings 11 Southampton Street, Strand, he having come according to my invitation to see beforehand the notice which I had prepared for the — newspaper of the second series of his Naval Sketch Book. He had his pockets stowed with newspapers containing reviews and notices of his book, which he said he had bought to show his publisher Whitaker. One of these by our mutual friend Robert Bell, editor of the *Atlas*, was good and friendly. We talked of Marryatt's sketches, *Peter Simple*, &c.; he praised Marryatt, then editor of the *Metropolitan Magazine*."

"April 24, 1834.—On this occasion the King and Queen went in state the first time for some years to visit Drury Lane Theatre. I and my wife got tickets of admission from Bunn to get on the stage when the performers were singing the National Anthem. The King and Queen were well received, although the matter was at first a little doubtful. This was my first appearance on any stage in any character. I took part in the choruses standing immediately behind Templeton and little Miss Poole. A curious thing occurred on this evening. After the play in which Miss E. Tree played Lady Teazle, the audience called for Rule Britannia, the second verse fell to the lot of Templeton, and strange enough he had not even the first line of it by heart; however, by Braham's aid he endeavoured to bungle through it. The third verse was sung by 'little' Fitzwilliam, who was there by accident."

THE first of a new series of documents in Basque and French to illustrate the period of the Revolution, has just been published by Cazals, of Bayonne. This series will in one sense be the complement of, in another introductory to, the earlier series of *Documents pour servir à l'Etude Historique de la Langue Basque*, previously commenced by the same publisher. To the student of Eskuara it will prove introductory, inasmuch as the Basque of these documents will differ much less from the Basque of to-day than does that of the sixteenth and seventeenth centuries, and also because these later documents are bilingual, and the French will always be printed, as in the present pamphlet, side by side with the Basque. Historically, this series will be the complement of the earlier one, and the two will give a sufficient historical conspectus of the Basque language from the earliest printed works to the present day. Even to the more general historian this series will not be devoid of interest; it will show the working of the Revolution and of the revolutionary spirit in one of the most remote provinces of the kingdom, and that one in which the people had had less than any others to suffer from the evils of the old régime. In the present "Cahier des Vœux et Instructions des Basques-Français pour leurs Députés aux Etats-généraux de 1789," the abuses signalised are chiefly those of excessive

taxation and of mal-administration of justice; the only case of feudal oppression indicated is that of the ecclesiastical seigneurs of the parishes of Bonloc and Lahonce, while the attachment of the people to the family of the Gramonts, the hereditary governors of Bayonne, is warmly expressed.

NOTES OF TRAVEL.

THE long and elaborate letter of Dr. Petermann to the Royal Geographical Society, which we published in our last issue, seems to have had the effect of giving the final push to the tardy resolve of the English Government to fit out an expedition for the exploration of the Arctic regions. Mr. Disraeli has declared definitely that we are to have such an expedition, in a letter published in the *Times* of Tuesday last. We are informed that the command will be taken by Captain Markham.

IN the course of the excavations at present going on for the purpose of draining the Teltow district near Berlin, and constructing a canal, an enormous quantity of amber was lately obtained, consisting of more than eighty separate masses, which have been sent to the Town Museum at Berlin, to be incorporated with the national local collections.

LIEUTENANT CONDER has forwarded to the Palestine Exploration Fund notes on a few sites connected with the hill country of Judah, noted by himself during the first fortnight of the winter work, which will lie wholly in the south of the country. Vandeveld's Eshcol, which he has visited, he finds to be a fountain called Ain *Keshkali*, instead of *Eshkali*. Unless, therefore, an aleph can be replaced by a kaf, this identification must be given up. Bezeth, or Bethzetho, the place occupied by Bacchides on retiring from Jerusalem, where subsequently Judas was defeated, Lieutenant Conder thinks he has found in Beit Zata, where, at any rate, the only requisite, "the large pit"—*τὸ φῶτος τὸ μέγα*—is perhaps satisfied by the existence of a great *birket*. He also thinks he has found the Seir, connected with the invasion of the Moabites and Maonites in the reign of Jehoshaphat, in a modern village called Sair. The direct road from the cliff of Ziz, if that be the ascent by which the Arabs now gain the higher ground from Ain Jidy, leads to Tekua, and there is an important pass towards the village of Beit Anum, in which the village of Sair lies hidden among the hills, surrounded with gardens and quite unprotected. Pilate's aqueduct has also been followed to its source from the point, near Tekoa, at which Mr. Tyrwhitt Drake left it. It is found to be about thirty miles long, following the windings of the valleys. Josephus says it was twenty-five Roman miles in length.

It appears from the communications addressed to Professor Bruhns, of Leipzig, in regard to the movements of the German expeditions appointed to watch the transit of Venus, that the *Gazelle*, which left Plymouth on July 3, anchored in the harbour of Porto Troja (Island of St. Iago) on the 27th of that month, and reached Monrovia (Liberia) on the 4th, and Ascension Island on August 18. The frigate which had conveyed the first of the three great German expeditions had arrived at Cape Town on September 26, after a very short and favourable voyage from Banana, and proposed remaining there till October 3, which had been fixed for the day of sailing to the Kerguelen Islands. The second of the German expeditions, which was bound for the Auckland Islands, is reported to be in as favourable a condition as that of the *Gazelle*; while the third, or Chinese expedition, which left Southampton on August 20, is announced, through private despatches, to have arrived on October 17 at Shanghai, where it was to remain till after the transit. According to the announcements received through the cable at the Paris Observatory from Professor Janssen, the head of the Nagasaki expedition, the weather was favourable at that station

on the afternoon of November 8, and observations were going on at the time the message was being transmitted.

RECENT explorations in Newfoundland have brought to light the existence of new sources of wealth hitherto confined to a narrow belt of country adjoining the coast, where the inhabitants plied their fishing. Mr. Murray, the engineer in charge of the Geological Survey, during last year examined the region around St. George Bay, and discovered fertile wooded valleys, coal and gypsum deposits (the latter of considerable extent), and petroleum springs. During the current season he surveyed the basin of the Gander River to the eastward of the island, which is inhabited by about a hundred poor people, who live by salmon-fishing in summer and hunting in winter. The river winds considerably in its course, and forms four vast marshes, the largest of which is six miles long and studded with islands; the scenery is of rare beauty, though the banks have a uniformly gentle slope and are rather unvarying in their aspect. On August 13 last Mr. Murray reached Gander Lake, about thirty miles up the river. He considers that the land there surpasses any portion of Nova Scotia or New Brunswick in its suitability for colonisation, and that it would afford plenty of room for 100,000 settlers.

M. GORCEIX, a traveller known for his researches in Turkey, has made known to the Paris Geographical Society some of his investigations in the province of Rio Grande do Sul, in the south of Brazil. The rivers flowing down from the Sierra da Mar, a range running parallel with the coast, bring down a constant accumulation of quartzite *débris*, which on rising above the sea level is soon covered with luxuriant vegetation, while a deposit or accretion of shells serves to bind and protect the margin against the action of the waves and the tempests. Under the favouring influence of tropical heat and humidity, islands and peninsulas of great fertility are thus soon formed. Beyond the Sierra da Mar to the westward, porphyry succeeds the granite and gneiss, and still further on in the basin of the Candiota coal has been discovered by M. Plant, a fact of great economic importance to the Brazilian Government. Near the town of Bage the climate is much more temperate, the flora is like that of Southern Europe, and there are no forests. The traveller crosses undulating plains, similar to the pampas of the Argentine Republic, which afford a rich pasture to large herds of oxen. The sparse population is chiefly composed of Portuguese and Spaniards, while there is still a trace of the old Indian blood in the Gauchos, a half-civilised race who appear to live entirely on horseback. A few Germans have settled, and are doing well in the north-west of the province, and there is plenty of accommodation for a much larger influx of immigrants.

SMALL-POX appears to rage unchecked among the nomad inhabitants of the Kalmuck steppes. The *Golos* states that as soon as a case breaks out in a *kibitka* or tent, the remaining inhabitants treat the invalid as if he were already dead, and leave him without a living being to tend him. The only so-called remedy ever employed is warm milk and water; and brandy, accompanied by a wholesome penance in the shape of scourging, is considered a good preventative. There is a doctor who receives about 3*l.* a month for looking after the sanitary condition of the Kalmucks, but he lives at Astrakhan, and his time is entirely occupied with surgical cases, deeds of violence being unfortunately not unknown in those parts. There are also two official vaccinators attached to each *oulous* or circle, but these individuals, it is said, confine their official labours to drawing their stipends and clamouring for more. It is not surprising, therefore, to read that a tenth of the Kalmucks succumbed during last winter to the ravages of this terrible disease.

DR. NACHTIGALL has arrived at Khartum, and has addressed from thence an important letter, bearing date September 18, to M. Duveyrier, in Paris, on the subject of the war in Dar-Fur, and his journey thence from Wadai. Our readers are perhaps unaware that this enterprising traveller has been absent from Europe for more than five years; during that time he has traversed a large extent of Central Africa, and though he describes himself as not utterly broken down in health, fever has tried him severely. His letter to M. Duveyrier is reproduced in the *Débats*, and from it it appears that the real *casus belli* in Dar-Fur was the hankering which the Egyptian Government have always had after the countries west of Kordofan, i.e., Darfur and Wadai. This covetousness led them to supply soldiers and money to a pretender named Fighi Muhammad el Bolalâl, who undertook to annex the wished-for countries, and took as his theatre of operations the region between the southern boundaries of Dar-Fur and the Bahr-al-Ghazal. Here, however, there was already installed an ivory and slave merchant, named Ziber. By dint of purchasing muskets, and through his unscrupulous audacity, he had succeeded in making the surrounding tribes pay tribute to him. El Bolalâl's presence naturally provoked a quarrel, and Ziber, at the head of a motley rabble composed of the dregs of the population, succeeded in slaying his rival. With characteristic impudence, he not only succeeded in procuring a free pardon from the Egyptian Government, but by dint of a money bribe got promoted to El Bolalâl's place. He next turned his attention to a tribe called the Rizegats, tributaries of Dar-Fur, and by enticing away their allegiance produced an open rupture between the Sultan of Dar-Fur and himself. One section of the tribe having remained true to its old master and pillaged a caravan on its way to Ziber's headquarters, was promptly punished, and their territory formally annexed in the name of the Khedive. Ziber was created Bey and Mudir of Schegga, with the rank of colonel in the Egyptian army, and then invaded the country to the west between El Hofra and Dar-Fur proper. Ismail Pasha, the governor of the Soudan, then showed his hand, and having openly despatched guns to Ziber, proceeded at the head of 2,000 infantry and irregular cavalry to El Obeid, with the intention of marching upon Fadjiir, the chief town of Dar-Fur. Ziber has 8,000 men and six guns, while the Sultan of Dar-Fur has no less than 100,000 troops, but they are but poor stuff. Should, however, the Sultan of Wadai join Dar-Fur, the war will assume a serious aspect, involving as it does the fate of an immense tract of equatorial Africa.

DR. PETERMANN has also received a letter, under date Khartum, September 15, from Dr. Nachtigall, in which he gives a detailed description of his route from Wadai as far as Kordofan, and states that had he known that war was so imminent he would not have stayed four months in Dar-Fur, as the hatred and fanaticism shown by the inhabitants (though the Sultan himself was friendly) made his task of collecting information on the manners and customs of the people a very unpleasant one.

At the last meeting of the German scientific men and physicians at Breslau, Herr Karsten delivered an address describing the scientific explorations made lately in the Baltic and the North Sea, by means of which, among other things, the important discovery is held to have been made, that the comparatively mild temperature which characterises the west coast of Norway is not, as has hitherto been considered, the effect of the Gulf Stream, but of a warm current of water that leaves the Baltic when the cold weather sets in.

JOHN MILTON, THE SCRIVENER.

IN the examination of some bundles of proceedings belonging to the Court of Requests, Mr. R. F. Isaacson, of the Public Record Office, has met with a suit in which John Milton, the father of the poet, was a defendant. A brief summary of the chief points of the case may perhaps prove of interest to our readers, inasmuch as the matter contained in these proceedings is new, and illustrates one of the most important branches of the business of a scrivener. Moreover, as the bill of complaint contains a somewhat serious charge against one who is described by his son as "a man of the utmost integrity" (*viro integerrimo*), and as his grandson informs us "conspicuous for industry and prudent conduct of his affairs," it seemed at first sight strange, to find accidentally documents which apparently contradicted the received notions as to his character. It therefore appeared to be a matter of some interest to trace the result of the insinuations made against him, in order to ascertain in what way they were met.

The proceedings are not complete, but those already found are quite sufficient for our purpose, that is, for the support of the received character of the poet's father. They consist of four documents: a bill of complaint, commission, and two answers. Commencing with the bill of complaint, which is dated 28 May, 12 Charles I. (1636)—and retaining as far as possible the wording of the document—it is set out by Sir Thomas Cotton, of Sawtrey in the county of Huntingdon, executor of the will of John Cotton, Esq., deceased, that the said John Cotton, being an old man of fourscore years and upwards, did about five years previous to the above date put into the hands of one John Milton and Thomas Bower, servant to the said John Milton, divers great sums of money to be let out at interest "after the rate of eight in the hundred." The names of the persons to whom the money was so put out are given: among them we notice—Sir Kenelm Digby, Sir Richard Molineux, Sir William Norris, Sir Robert Heath, Sir William Sandys, Sir George Horsey, Mr. Dabridgecourt, and many others, the sums lent amounting to 3,600*l*. The bill continues, that at first the interest accruing from these sources was paid regularly, and it was always understood that the sums so invested had been put out to "sufficient and able men," and in fact this was the case. But, shortly after, the said John Milton and Thomas Bower, finding the said John Cotton to be "decreipt" and "unable to follow his occasions," and by reason of his great years constrained to keep his chamber, they—by the practice of one Thomas Holchar, an attorney at law, used by the said John Cotton in suing bonds—ceased to bring interest or principal, and made out that both interest and principal were desperate, and that the debtors were non-solvent. Thus, Milton and Bower tried to persuade Cotton to give up the bonds for the sum of 2,000*l*., so that they might then endeavour to recover, and if successful, retain for themselves the original sums lent out. The complainant further says that the said Milton and Bower got one John Collwell, Esq., with whom Cotton then lay, for the sum of 200*l*., to assist them in working upon Cotton as to the desperate state of these debts, which he did. By which combination they did draw Cotton to give up the bonds to Bower for the 2,000*l*., so that they might renew them in their names, and so take the principal and interest. Before the completion of this transaction Milton and Bower had received 500*l*. on account of the said bonds, and as soon as the matter was completed they proceeded to recover the whole sum of 3,600*l*., being 1,600*l*. more than they had paid. Shortly after, John Cotton died, leaving his nephew Sir Thomas Cotton, the complainant, his executor, who "in a friendly manner" requested the said Milton and Bower to accept their 2,000*l*. back, and to pay over all sums received or secured on the said obligations, and to deliver over the new securities for the said debts, and to account

to Sir Thomas Cotton for the 3,600*l*. This being refused, the complainant prays for process of Privy Seal to compel Holchar, Milton, and Bower to account.

Such being the serious charges set out in this bill of complaint, a commission follows, dated March 10, 1636-7, which authorises an enquiry with respect to the allegations so made. This brings us to the principal of the documents under notice, viz.:—"The answer of John Milton to the bill of complaint of Sir Thomas Cotton, baronet, executor of the last will and testament of John Cotton, Esq., deceased, complainant." It is dated May 1, 1637, and is of some length, but contains a complete and satisfactory answer to the charges in the bill. Briefly, Milton replies that John Cotton, though a man of good years, was still of good memory and understanding, and was no ways "decreipt" in body or defective in mind, to his knowledge. He also denies that five years since the said John Cotton put into his hands or Bower's—his partner, and not servant as stated in the bill—any sum to be let out in trust; but he admits that before he and Bower became partners, and after their co-partnership, the said John Cotton did dispose of and lend at his shop, situate in Bread Street, London, divers sums to the value of about 3,300*l*. He confesses also that he thinks it may be true that the sums mentioned in the bill, or most of them, were lent out by Cotton, but the particulars he cannot remember, his employment being great in that way, and the matters being since he gave over his trade; but he saveth that the moneys were not put into the hands of this defendant, or of the other defendant T. Bower, within five years; since it manifestly appears by the plaintiff's own bill that the bonds were before that date, and divers of them fifteen years since; and that the interest was always paid soon after its receipt.

Moreover, as the answer proceeds, this defendant (Milton) confesseth, that the said John Cotton in his lifetime, by what reason this defendant knoweth not, "but conceaveth it to be out of timorousnes," and fear that he might lose some of his debts, did voluntarily make an offer to this defendant to accept 2,000*l*. for the moneys lent and managed for him at this defendant's shop, which moneys amounted to about 3,300*l*. But this offer the said defendant utterly refused, and was much grieved at the same, and took it very ill of John Cotton that he should make such an offer, as it was a great disparagement to this defendant, his trade, and shop; and the said defendant assured him his money was in no danger, and so he departed. Cotton, however, persisting in his fear, then went to Bower as the said defendant hath heard, and Bower joined with Holker, an attorney in the Common Pleas, and procured certain moneys of Sir Thomas Middleton, late alderman of London, which were paid to Cotton upon bargain for the bonds. The answer further states, that although John Milton and Bower were co-partners in the trade of a scrivener, yet they were never partners concerning the bargain pretended by the bill. The defendant Milton therefore prays to be dismissed from forth the same, with his reasonable costs and charges in this behalf wrongfully sustained. Thus, Milton entirely exonerated himself from any complicity in this business, and left his partner Bower to put in his answer as to his share in the matter in whatever manner he might think fit. This answer has, however, not yet been found; but the fourth document—a much decayed fragment—is the further answer of Thomas Bower, dated December 5, 13 Charles I. (1637), in which, from a clause at the end just decipherable, that "the defendant (Bower) conceiveth the interest money due on every the said bonds until the said assignment, and putting over of the same to this defendant, did not belong to the said John Cotton as aforesaid, therefore not material to the complainant to know how much thereof this defendant received, or of whom"—it

would appear that Bower stood his ground as to the transaction, and awaited the decree of the Court as to the validity of the assignment of the bonds. This decree has also yet to be traced, but will hardly be attended with any great difficulty to anyone interested in the point.

BOSTON LETTER.

Boston : Oct. 29, 1874.

The first volume of Mr. Hubert Howe Bancroft's *Native Races of the Pacific States of North America* has just appeared. It is a good-sized octavo of about eight hundred pages, containing a rich store of valuable information concerning the aboriginal inhabitants of the western half of this country. The author has been satisfied with going over the work of others, selecting whatever might be of importance and arranging it in the most convenient form for the use of those who may build theories with these facts for a basis, and who will owe a large debt of gratitude to Mr. Bancroft's thoroughness and exactness.

He says, in his preface—

"At present the few grains of wheat are so hidden by mountains of chaff as to be of comparatively little benefit to searchers in the various branches of learning; and to sift and select from this mass, to extract from bulky tome and transient journal, from the archives of convent and mission, facts valuable to the scholar and interesting to the general reader; to arrange these facts in a natural order, and to present them in such a manner as to be of practical benefit to enquirers in the various branches of knowledge, is a work of no small import and responsibility."

It would have been hard to find any one who was better qualified for this unambitious but useful task. It was fifteen years ago that Mr. Bancroft began collecting material for this work, and after having accumulated some sixteen thousand books, manuscripts, pamphlets, &c., he began to prepare his book in 1869. The difficulty of the task it is easy to judge from the fact that no fewer than twelve hundred authorities are quoted by the author.

He has divided the native races of the Pacific States into seven groups, namely: I. Hyperboreans, those dwelling north of lat. 55° N.; II. Columbians, living between lat. 42° and lat. 55°; III. Californians and inhabitants of the Great Basin; IV. New Mexicans, including the nations of the Colorado River and northern Mexico; V. Wild tribes of Mexico; VI. Wild tribes of Central America; VII. Civilised nations of Mexico and Central America. He says that there is no system of classification which would be perfectly satisfactory, and that therefore he has adopted this geographical one as the clearest to the general reader. In the treatment of each of these divisions he gives a list of the different nations composing it, an account of the physical geography of the region they inhabit or inhabited, of any noteworthy peculiarities in the climate, the physical characteristics of the people, their dress, dwellings, food, weapons, implements, arts, laws, government, domestic habits and amusements, their marriage customs, their treatment of women, their diseases, method of burial, &c., &c. If there are many tribes composing the nation, there is devoted to each whatever space is necessary for the mention of its peculiarities; and at the end of the chapter treating of each of the prominent groups is an appendix giving as nearly as may be the tribal boundaries. Every page is fully annotated with quotations confirming and often adding to the statements in the text. Reference is made to the volume and page of every authority quoted.

Where there is so much that is curious, it is impossible further to compress the concise body of facts to be found in this book; but a few curious facts may be pointed out. The *cowade* is mentioned as prevailing among the Californian Indians. And while there is generally shown great diversity of repugnant customs among the

different tribes of Indians, they hold, with but few exceptions, to the habit of banishing from the tribes for a short time girls who are just attaining maturity. One lesson to be learned from the book is that it is only the civilised man who can break away from the rigid control of fashion: nowhere is it more despotic than among savages.

The second volume is to treat of the civilised nations, while the subjects Mythology, Languages, Antiquities, and Migrations are left for the three remaining volumes of the work. Judging from this first volume, Mr. Bancroft deserves much gratitude for undertaking and accomplishing so well this difficult task.

Dr. O. W. Holmes's *Songs in Many Keys* is a collection of various little poems which were in danger of being buried in forgotten newspapers, or in the back volumes of magazines. Besides those which were written to order for various festal occasions there are some amusing *vers de société*, such as "Dorothy Q," and "The Organ Blower." It is an unpretending, readable volume.

Mr. Whittier, too, has made a collection of a few of his scattered poems, adding to them eight or ten short pieces written by his sister. The book bears the title of *Hazel Blossoms*, alluding to his age and the probability of his writing but little more.

He says:—

"Small beauty hath my unsung flower
For spring to own or summer hail;
But, in the season's saddest hour,
To skies that weep and winds that wail
Its glad surprisals never fail.
O days grown cold! O life grown old!
No rose of June may bloom again;
But, like the hazel's twisted gold,
Through early frost and latter rain
Shall hints of summer-time remain."

Of his sister's poems, perhaps the one most worthy of mention is that called "Lady Franklin."

CORRESPONDENCE.

THE RUSHWORTH GLOSSES.

Mill Hill: Nov. 16, 1874.

The appearance of the Rev. W. W. Skeat's Gospel of St. Luke in the various Anglo-Saxon and Northumbrian versions, for the Syndics of the Cambridge University Press, induces me to draw attention to the Rushworth Gloss, or rather Glosses, and their relationship to that of the Durham Book, or Lindisfarne Gospels. Mr. Hardwick, in his Preface to St. Matthew, says of the Rushworth, "the interlinear text from the Lindisfarne Gospels is here accompanied by a *cognate version* known as the Rushworth Gospels;" and Mr. Skeat, in his Preface to St. Mark, says: "Hitherto it seems hardly to have been pointed out with sufficient distinctness that the Rushworth Gloss is really derived from the Lindisfarne in a very direct manner," and he goes on to show at length that the Rushworth is, in effect, very nearly a simple transcript of the Lindisfarne. Now, as I happen to have acquired a very intimate acquaintance with the Gospel of St. Matthew in both the Lindisfarne and Rushworth versions (having, in days when books were not so accessible to me, in a remote Scottish village, as they are now, made a complete transcript of both, from a copy of the Surtees edition lent me by the Rev. Canon Greenwell, of Durham, in course of which the language and phraseology of both became indelibly imprinted on my memory), I was, in recently reading Mr. Skeat's Preface to St. Mark, greatly astonished by a statement which was completely at variance with my own experience. But a hasty plunge into the versions themselves speedily dissipated the mystery: Mr. Hardwick's and Mr. Skeat's words are true of Mark, Luke and John (with exception of John xviii. 1-3) but *not* of Matthew (which Mr. Skeat has not had occasion to collate, his connexion with the edition commencing with Mark; for there are *two* distinct Rushworth glosses: the gloss to St. Mark, &c., a copy, as Mr. Skeat shows, of the Lindisfarne; and the gloss to St. Matthew, a work totally different, neither "cognate" with the Lindisfarne, nor connected with it in any way whatever, either in version or dialect. The Rushworth version of the three latter Gospels is, like its original, Northumbrian; like it also, it is a verbal gloss, following the Latin text word for word in all its inversions: the version of St. Matthew is in ordinary Anglo-Saxon, very little modified from the usual West Saxon

orthography, and it is not a word-for-word gloss, but a readable idiomatic version. As a rule, indeed, the Rushworth version of Matthew has much more in common with the "classical" West Saxon, in the first column of the Cambridge edition, which has been already edited by Parker, Marshall, Thorpe, and Bosworth, than with the Lindisfarne. Yet, there is not the slightest reason to suppose that the Rushworth is in any way connected with the "classical" version; it is either an original work of Farman's, or a copy of one of which nothing else is known. A single specimen will (to those who have not at hand Messrs. Hardwick and Skeat's splendid edition, or that of the Surtees Society) illustrate all four points, viz.: that the Rushworth Matthew is distinct from the Lindisfarne in origin, distinct from it in dialect, distinct from the West Saxon in origin, but akin to it in dialect. I open at random at Matthew v. 32:—

*L. ic soðlice cweð to iuh, forðon eghuele
†R. Ic þonne secge eow or iu, þætto æghwile þara
‡W. Ic secge eow to soðum, þæt ælc

L. seðe forletes wif his, buta unclanes lustas inting,
R. þe forelet his wif, butan forlegennisse þinge,
W. þe his wif forlet, buton forlegennisse þingum,

L. gedoeð or wireas ða ilca gesyngge; and seðe
R. he doep þæt hiu demunge liege; and seþe
W. he deð þæt heo unriht-hæmð; and se

L. forleteno lades he syngieð.
R. þæt forletne him lædeþ, hefep unrelit hæmep.
W. unriht-hæmð þe forletene æfter him geimð.

L. Eft-sona herde ge forðon acuden is
R. Eft ge geherdon þætto cwæden was
W. Eft ge gehyrdon þæt gecwæden was

L. ðem aldum: ne ðerh suero ðu to suiðe,
R. gú-monnum: ne swer þu man,
W. on ealdum cwydm: ne forswero þu,

L. ðu forgeldest soðlice drihtne gihata aðas ðine.
R. agef þonne drihten þine hapas.
W. soðlice drihtne þu agylst þine aðas.

We have, therefore, in the Rushworth version of St. Matthew a new and independent Anglo-Saxon translation; and we may well regret that chance or design put the Lindisfarne MS. in Farman's way when he had reached the end of St. Matthew, and thus stopped him in his own translation, if it was his, or in following his southern copy, if he had one. Knowing that Farman's work at the gloss (with exception of John xviii. 1-3) terminated in the middle of the 15th verse of the 2nd chapter of Mark, the idea struck me, on my discovery of the difference between Matthew and Mark, that probably all Farman's work showed the independent translation, and that we should find the servile following of the Lindisfarne commence with the work of the other glosser Owun. But on eagerly turning to the place, I found it was not so; the independent version ends with Matthew, and the small portion of Mark done by Farman is, like the rest of it, after the Lindisfarne. Nevertheless, this small portion presents points of great interest. As is well known, the Lindisfarne gloss is throughout characteristically northern, not only in its spelling and phonology, but also in its grammatical inflections. Thus the verb has in the plural of the present indicative *-as*, and in the third singular *-es*, instead of the *-að* and *-eð* of the "classical" West Saxon. The present infinitive ends in *-a*, or *-e*, instead of *-an*, and final *n* is similarly lost from verbal plurals, and the cases of nouns and adjectives; the old Northumbrian, in these and many other peculiarities, approaching the cognate Frisian and Scandinavian idioms. Now Farman's Matthew has, *exceptis excipendis*, none of these peculiarities; its inflections, as I have said before, are those of the West Saxon, somewhat degraded perhaps. And even in the first 69½ verses of Mark, where Farman implicitly follows the words and order of the Lindisfarne, he systematically alters the inflections to the dialect of his Matthew,

allowing only here and there, as it were by oversight, a Lindisfarne form to creep into his own work. Moreover—what is perhaps an individual peculiarity—the Lindisfarne gloss altogether taboos the *thorn* (þ) except in the contraction for *that* (þ) using the *divided d* (ð) in all positions, while Farman almost as exclusively uses the *thorn*, the divided ð being only a by-form in his Matthew; so in the part of Mark copied by him from the Lindisfarne, he changes the ð systematically into his þ, here again, however, occasionally nodding, and admitting a stray ð from his exemplar. Thus the Lindisfarne foregearwas, wyrcas, wæxes, cymes, geleafes, beforan, losigre, nalde leta spreca hia, are changed by Farman into foregearwað, wyrcap, wæxep, cymep, geleafap, beforan, ne let him spreca. But when we come to Owun's share of the gloss in the middle of ch. ii. v. 15, we find the Lindisfarne inflections admitted wholesale and unchanged, *ge habbas, hia ne magun festa, &c., &c.*, the Rushworth becoming henceforth simply a copy of the Lindisfarne, with such variations as were common to scribes of independent judgment and taste in the period, many of these being indeed in the direction of making the version still more regularly northern. Thus, Mark xiv. 7:—

*L. symble forðon ðorfendo gie habbað mið iuh, and
†O. symle forðon ðarfo ge habbas iowih mið, and

L. mið-ðy gie wellæ gie magon him woel doe, moð
O. miððy ge welle ge magun ðem wel doa, mee

L. utudlice ne symle gie habbað
O. wutudlice ne symle habbas

Thus, we really have in the Rushworth version, three distinct portions: (1) Matthew, and John xviii. 1-3, in which Farman gives us his independent southern gloss; (2) Mark i. 1-ii. 15, in which he southernises the Lindisfarne; and (3) Owun's—all the rest—which is Lindisfarne almost pure and simple. I suppose Farman was, say a Midland man, who set himself to gloss the Gospels in his monastery; when he had got to the end of Matthew, the brotherhood was joined by Owun, a Northumbrian, who seeing Farman's work, told him of the Lindisfarne gloss already in existence, and offered to borrow the manuscript for him. On receiving it, Farman began to copy it in for his St. Mark, southernising the grammar as he went on; but soon getting disgusted with this mere mechanical work which any copyist could do, he stopped short in the middle of a verse, and said, "See here, Owun, this is simple transcription which you can do as well as I; you go on copying this, and let me spend my time in some more original work." Owun obeyed, and simply followed the Lindisfarne through the rest of the book. Some such theory as this accounts satisfactorily for the whole circumstances. The three verses done by Farman again at the beginning of John xviii. are very remarkable. Here in the midst of Owun's servile following of the Lindisfarne, the old glosser takes up the pen for an instant, and gives us three verses of fine idiomatic Saxon, not like his Mark a southernising of the Lindisfarne, but like his Matthew a totally independent version. I have spoken of Farman's dialect as *southern*; I use the word comparatively, as equal to South-humbrian. As to the precise dialect, or whether it be a dialect at all, that is a larger question than we can well discuss now. Farman, in the passage quoted above speaks of his *hapas* instead of *apas* = *hoaths* for *oaths*; elsewhere he talks of his *eorta* instead of his *heorte* (Matt. vi. 21), and often says *eora* for *heora* (viii. 34; ix. 30, &c.) repeatedly showing a Midland—say a Leicester—man's contempt for his *h's*. The fact also that his variations from West Saxon grammar look northward, as in occasionally dropping infinitive *-n*, and using *hie* for *hi*, with sometimes *pe* for *se*, &c., seems to point in the same direction; but it would require a good deal of careful study, and something more perhaps, to satisfy one that the gloss, though by a Midland

man, is in a pure Midland dialect. This study may perhaps be given to Farman's Matthew, now that it is shown to be neither a copy of the Lindisfarne, nor cognate with it, nor even in the Northumbrian dialect.

JAMES A. H. MURRAY.

TWO NEW MSS. OF CICERO'S LETTERS AD FAMILIARIS.

Hampstead: Nov. 16, 1874.

Dr. Franz Rühl, of Dorpat, who has been for some months exploring the chief MS. collections in this country, *e.g.*, in the British Museum, at Lord Ashburnham's, and in the library of the late Sir Thomas Phillipps, at Cheltenham, has written an interesting letter to Ritschl, in which he gives an account of two hitherto uncollated MSS. of Cicero's Letters ad Familiares. It was the belief of Orelli, stated at considerable length in the preface to the third volume of his Cicero (1845), that the Medicean codex Plut. xlix. cod. ix., of the eleventh century, is the archetype of all the existing MSS. of Cicero's letters; the parent, not only of Petrarch's copy, but of all the other copies of the fourteenth and fifteenth centuries. This opinion, which is in opposition not only to the declared testimony of Ernesti, "*codex meus ceteris antiquior est, seculi, ut uidetur, decimi aut undecimi*," but of Wunder—a most judicial and cautious critic—is now proved to be false, by Dr. Rühl's examination of two Harleian codices, 2,682 and 2,773, in the British Museum.

The first of these is a parchment manuscript of the eleventh century, as Dr. Rühl and M. Lagarde, to whom he showed it, both pronounce independently. It contains, fol. 1^r-52^r, Cicero's Epistulae ad Familiares, books ix.-xvi.; fol. 52^r, Cicero's Epistulae ad Augustum Octavianum; fol. 53^r, Q. Cicero de petitione consulatus; this is followed by other works of Cicero, as well as (on fol. 135^a) by Fulgentius de Abstrusis Sermonibus. The letters have been corrected by two hands, one contemporaneous, the other of the fifteenth century. In some cases indices are prefixed to the books, in others not.

Dr. Rühl considers it beyond doubt that this Harleian MS. and the Medicean spring from the same archetype, but that each is independent of the other. Thus the letters xii. 22, *sqq.* are not divided, exactly as in M. The following passages will serve to show the value of H, as correcting, or helping to correct M:—

ix. 1. 2 *infidelissimis H, infidelissimas M*
diuidetur H, diuidetur M

ix. 2. 1 *iturum H, iterum M*

ix. 2. 2 *linguas H, linguas M*

ix. 2. 4 *intererit H, interit M*

ix. 8. 1 *tui H, sui M*

ix. 9. 2 *ulti H, nulli M*

ix. 11. 1 *eo H, ego M*

In ix. 6. 2, where M has *ubique*, H has *utro-bique*, as conjectured by Schütz; in ix. 15. 4, H has *ponor*, a conjecture of the same critic; ix. 22, 1, *usurpat*, as conjectured by Nobbe, not *usurpato*, as M; in ix. 2. 1, Baier's reading *nobis non scripsissemus* for *nobis conscripsissemus* of M.

It would be interesting if H added any new letter to the existing collection. At the time when Dr. Rühl wrote to Ritschl he had not yet discovered any such additions; on the contrary, H omits some letters in M; *e.g.* ix. 18, and in x. 31. 4 the clause *Quod cum Lepidus—contrarium fuit*. On the other hand, H fills up no inconsiderable number of shorter lacunae in M; a matter of great importance, where the text is at once so obscure and so interesting as in these letters of Cicero's.

The other Harleian MS. is of the twelfth century. It contains books i.-viii. 9. 3 *puto etiam si nullam spem*. It has several lacunae, *e.g.* from i. 9. 20 *non solum praesenti* to ii. 1. 2 *dignitate es consecutus*. Books i. and ii. are undivided, and the succeeding books are numbered second, third, &c. Dr. Rühl considers this MS., from its somewhat inferior antiquity, to be considerably less valuable than M; to be, however, quite indepen-

* Lindisfarne. † Rushworth. ‡ West Saxon. ||

* Lindisfarne. † Owun.

dent of it, and absolutely indispensable for the future criticism of the text. He reserves more detailed judgment to another occasion.

R. ELLIS.

HERA BOOPIS AND ATHENE GLAUKOPIS.

Athens: Nov. 1, 1874.

In his learned article in the ACADEMY of January 10 last, Professor Max Müller writes: "Whatever *γλαυκῶπις* may mean, it cannot mean owl-headed, unless we suppose that Here *βοῶπις* was represented as a cow-headed monster."

Although I cannot yet show an idol of Hera with a cow's head, I can at least prove now beyond any doubt that she had originally a cow's head, from which her Homeric epithet *βοῶπις* is derived. I extract the following from Th. Panofka's *Argos Panoptes*: "When in the battle between the gods and the giants the former took the shape of animals, Hera took the form of a white cow, 'nivea Saturnia vacca'" (Ovid, *Metam.* v. 330). We find a cow's head on the coins of the island of Samos, which had the most ancient temple of Hera, and was celebrated by its worship of this goddess (Mionnet, *Descr. des Méd. Ant.* pl. lxi. 6). We further find the cow's head on the coins of Messene, a Samian colony in Sicily (Millingen, *Anc. Coins of Greek Cities*, tab. ii. 12). The relation of Hera to the cow is further proved by the name *Εἰβοία*, which was her epithet (Pausanias ii. 22, 1 and 2), the name of one of her nurses (Plut. qu., *Symp.* 3, 9, 2; *Et. M.* 388, 56), the name of the island in which she was brought up (Plut. fr. *Daed.* 3). But in the name *Εἰβοία* is contained the word *βοῦς*. Hera had in Corinth the epithet *Βουναία* (Paus. ii. 4, 7), in which the word *βοῦς* is likewise contained. White cows were sacrificed to Hera (Paus. ix. 3, 4), (Hesych. *ἄγαν χαλκίαις*). The priestess rode on a team of two white bulls to the temple of the Argian Hera (Herodot. i. 31). Io, the daughter of Inachos, was changed by Hera into a cow (Lucian, *θεῶν διαλ.* 3; Diod. Sic. i. 24, 25; Herodot. ii. 41). Io was priestess of Hera (Aesch. *Suppl.* 299; Apollod. ii. 1, 3), and is represented as the cow-goddess Hera (Creuzer, *Symbolik* ii. 576). The Egyptian goddess Isis was born in Argos, and was identified with the cow-shaped Io (Diod. Sic. i. 24, 25; Apollod. ii. 1, 3; Hygin. 145); she (Isis) was represented in Egypt as a female with cow-horns, like Io in Greece (Herodot. ii. 41). Hera is at all events identical with Isis, with Io, and with Demeter Mykalessia, who derived her epithet "the roaring" from her cow-shape, and had her temple at Mykalessos in Boeotia; she had as door-keeper Hercules, whose office it was to shut her sanctuary in the evening, and to open it again in the morning (Paus. ix. 19, 4). Thus, his service is identical with that of Argos, who in the morning unfastens the cow-shaped Io, and fastens her again in the evening to the olive tree (Ovid, *Metam.* i. 630), which was in the sacred grove of Mycenae, close to the *Ἱπαιόν* (Apollod. ii. 1, 3). The Argian Hera had, as symbol of fertility, a pomegranate, which, as well as the flowers with which her crown was ornamented, gave her a tellurian character (Panofka, *Argos Panoptes*, tab. ii. 4; Cadalvène, *Recueil de Méd. Gr.* pl. iii. 1; Müller, *Denkm.* xxx. 132; Duc de Luynes, *Études Numismat.* pp. 22-25).

In the same way as in Boeotia the epithet Mykalessia, the roaring (a derivation from *μυκάω*), was given to Demeter on account of her cow-form, in the same way in the plain of Argos the name of *Μυκήναι* (a derivation from the same verb) was given to the city most celebrated for the cultus of Hera, and this can only be explained by her cow-form.

In consideration of this long series of proofs, certainly no one will for a moment doubt that Hera's Homeric epithet *βοῶπις* shows her to have been primitively represented with a cow's head. But a goddess with this attribute, a cow-headed monster, is not at all in harmony with the beauti-

ful forms in the Homeric songs; and besides, since the poet gives the epithet *βοῶπις* even (*Iliad* iii. 145 and xviii. 40) to mortal women, it is evident that long before his time people had ceased to represent Hera with a cow's head. But her epithet *βοῶπις*, which had been consecrated by the habit of ages, continued to be given to her; however, its primitive meaning had no doubt long been forgotten when Homer wrote, and he probably understands by *βοῶπις* nothing else than "large-eyed." Since the Ilium which Homer sings must have been destroyed more than 1,000 years before his time, I certainly should have found there numbers of cow-headed idols if Hera had had a cultus there; but such has not been the case. I have found there, it is true, three beautifully modelled cow-heads with long horns, on what I consider to be handles of vases (see tab. 149 no. 2952, and tab. 173 no. 3345 of my Atlas); and, though I believe they represent Hera, still I have no means to prove it.

From Hera's former cow's head was no doubt made her sacred cow, of which I found several examples in the depths of the Acropolis of Mycenae. At the same time I found there a lot of Hera-idols with two breasts, a very compressed face, and a "polos" on the head. Thus it is evident that the metamorphosis of Hera's head had already taken place before the cyclopiian walls of Mycenae were built.

Professor Max Müller writes: "Though we may be surprised at Homer assigning Athene as a patron-goddess to Ilium, so much, I suppose, is certain that when the poet (*Il.* vi. 311) said: *ἀνέμει δὲ Παλλὰς Ἀθήνη*, he did not mean that the idol of the goddess shook its owl's head in token of its non-acceptance of the prayers and offerings of the Trojan matrons assembled in her temple."

I perfectly agree with the learned professor: Athene's owl's head must have been supplanted by a female head centuries before the time of Homer, but her epithet *γλαυκῶπις*, which had also been consecrated by the use of ages, continued to be applied to her. Its meaning had no doubt long since been forgotten when Homer wrote, and he probably understands by it "owl-eyed." It deserves particular attention that the poet gives this epithet exclusively to Athene, and never to mortal women.

Even the latest prehistoric ruins at Troy are by many centuries older than Homer, and thus it happens that from six feet below the surface down to the virgin soil, in a depth of fifty-three feet, we find there in all strata of remains numbers of owl-headed idols of bone or marble, or modelled on terra-cotta vases with all the attributes of the woman. These idol-vases invariably have two wings and a cover in the shape of a helmet, with the indication of the hair. From Athene's owl's head was made her sacred bird, the owl, which we do not find at Troy, for, when the last prehistoric city was abandoned, the transformation had not yet taken place, and the site must have been lying waste for centuries before Homer. It may have been for a short time inhabited at the epoch of the poet, for, as stated before, I have gathered there, just below the ruins of the Greek colony, about seventy pieces of pottery which are most decidedly neither prehistoric nor Greek. But the owl, as Athene's sacred bird, figures both on the coins of Sigeion and Athens, two cities celebrated for the worship of Athene, who was their patron-deity, and it is very probable that the Athenians brought the sacred bird from the Troad when they conquered Sigeion in 605 before Christ. It is true that the rare coins of Sigeion hitherto found are only of copper, and date from Alexandrine times. But no excavations have ever been made on the site of Sigeion, and I expect that the most insignificant excavation down to the virgin soil would yield there silver coins of a much earlier date.

The accumulation of ruins and rubbish averages in Sigeion $6\frac{1}{2}$ feet in thickness.

HENRY SCHLIEHMANN.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Nov. 21, 3 p.m.	Crystal Palace Saturday Concert: Liszt's Second Concerto.
"	" Saturday Popular Concert, St. James's Hall (Billow).
MONDAY, Nov. 23, 8 p.m.	Monday Popular Concert (St. James's Hall).
"	Anthropological.
"	Geographical.
TUESDAY, Nov. 24, 8 p.m.	Messrs. C. Douglas Fox and Francis Fox on "the Pennsylvania Railroad."
WEDNESDAY, Nov. 25, 8 p.m.	Society of Arts.
"	Royal Society of Literature: Mr. Percy Gardner on "a Greek Inscription found at Ilium Novum in the Troad."
THURSDAY, Nov. 26, 8 p.m.	Linnean: Professor Allman on "The Structure of <i>Stephanocyathus mirabilis</i> ;" Dr. M. T. Masters, "Monograph of <i>Durionae</i> ."
"	Chemical: Papers by Messrs. G. H. Beckett and Dr. Wright, Messrs. W. K. Clifford, W. H. Perkins, A. H. Church, and Dr. Stenhouse.
"	Royal.
FRIDAY, Nov. 27, 1 p.m.	Sale by Messrs. Sotheby, Wilkinson, and Hodge of the second portion of the Howard Collection.
8 p.m.	Quckett Club: Mr. J. E. Inghen on "Personal Equation with reference to Microscopy."

SCIENCE.

The Hydraulics of Great Rivers: the Paraná, the Uruguay, and the La Plata Estuary.
By J. J. Revy. (London: E. & F. N. Spon, 1874.)

ENGLISH engineers have been engaged during the last quarter of a century, and are likely to be engaged for some time to come, in the construction of some of the largest hydraulic works in the world. There are large irrigation canals in Italy, the birthplace of hydraulic science, but they are small compared with the irrigation works of India. In India also there are great rivers to be embanked and regulated and rendered navigable. In all these works, a knowledge of the laws of fluid-motion is of very great importance, and it is not to our national credit, therefore, that the chief experimental researches in hydraulics are due to continental engineers, and that hydraulic theory has been more amply developed abroad than at home. The treatise named above is a very important contribution to hydraulic science, and it shows its author to be fully alive to the need of observing and recording the facts out of which, some day, a true theory of fluid-motion may be constructed. It contains an account of surveys, undertaken at the expense of the Argentine Confederation, and, we believe, under the direction of the well-known English engineer, Mr. Bateman. These surveys were carried out by Mr. Revy, who appears to have prepared before leaving England to make observations on the velocity of the currents of the great rivers, by methods and instruments partially new and likely to afford results of very great accuracy. He appears to be a very competent and sagacious observer, and he discusses his results with great critical ability, and fully brings out their bearing on the theories of fluid-motion. Without proposing any new theory, he states the points in which his results seem to be at variance with accepted rules. His results do not appear to us to be so much at

variance with existing knowledge as to Mr. Revy. He sometimes puts forward crude rules-of-thumb (that the mean velocity of a stream is eight-tenths of the greatest surface velocity, for instance) as accepted laws of hydraulics, and he has no difficulty in showing that such rules will not fit his observations. It is well understood since the experiments of Darcy that, in similar channels, the ratio of the mean and surface velocity varies with the absolute magnitude of the channel and with the roughness of its surface, though no very satisfactory rule for determining the ratio can be given till the general theory of fluid flow is more perfect. If, indeed, the law of the variation of velocity at different depths in a stream, which Mr. Revy derives from his observations, could be accepted as the exact law, then his results are of the highest importance, for they contain a key to the exact solution of the problem of fluid flow. But if, as we suspect is the case, Mr. Revy has generalised from too small a basis of fact, and the law which he states is only an approximation to the truth—then, though still important, Mr. Revy's researches must be ranked with those of his predecessors, and must carry weight proportional to their number, and to the care and skill of the observer. Mr. Revy's observations are likely to take a high rank for accuracy, but those which have a direct bearing on hydraulic theory are certainly not numerous; and, where the facts are complex and difficult to observe, it is of the greatest importance to check observations by repeating them.

The following description of the great rivers is abbreviated from the interesting and graphic account given by Mr. Revy. The La Plata, or so-called river Plate, is a large estuary of the South Atlantic, from which the sea water is continually displaced by the waters of the Paraná and Uruguay. These rivers keep it filled with fresh water, and hence may have arisen the custom of calling it a river. It has, however, no drainage area of its own, and is an immense shallow basin, about 125 miles in length, twenty-three miles in width at its narrowest part, and averaging three fathoms in depth. In ancient times the estuary extended 200 miles further into the country, and terminated at Diamante, where now the delta of the Paraná commences. Concerning this delta, Mr. Revy gives much useful information. The deposit of silt from the waters of the Paraná takes place, chiefly, in still water. In the Plata, subject to the Atlantic tides, there is still water, lasting in the upper part of the estuary for several hours, twice in the day. Deposit takes place, uniformly over the whole area, so long as the current ceases. With the re-establishment of the current scouring action begins, the scour being very unequal in different parts. Along the deep river channels the scour maintains the original depth; in other parts the scour does not remove the whole of the deposit, and the delta regularly augments. When at any part the water is shallow enough to permit the growth of reeds, the scouring action is almost completely arrested, and the shallow bank rapidly becomes an island.

Towards the upper end of the Plata estuary there enter the two great branches of the Paraná, the Paraná de las Palmas, and the Paraná Guazu, branches enclosing between them a deltaic island eighty miles in length. The Palmas is a deep and regular channel, 1,200 feet in width where Mr. Revy's section was taken, and fifty feet in depth. Its banks, raised only about a couple of feet above the river surface, are covered with long grass, six to twelve feet in height, and occasionally with forests of "Seibo." Towards its head Mr. Revy established a station, and there discovered that the tides of the Plata were propagated along the whole extent of the Palmas. There was a regular tidal rise and fall of the water at a distance of 70 miles from the mouth of the Palmas, and once, in the course of three days' observations, the current of the river was actually reversed, and there was a slight but perceptible flow, upwards, from the Plata. The wave travels from Buenos Ayres to the station on the Palmas, a distance of nearly 90 miles, in five and a half to four and a half hours.

Of the scenery on the other branch, the Paraná Guazu, in its deltaic part, Mr. Revy gives the following description:—

"The scenery in the lower reaches of the delta is fine, and there is a charm and grandeur in the profound stillness of these wild regions. So smooth is the surface of the Paraná, on a calm day, that we are inclined to call it a lake rather than a river. The banks in the lower reaches of the delta are covered with a thick forest of a peculiar tree called 'Seibo.' This tree is not unlike an oak deficient of leaves, having numerous short branches of very crooked growth; and it would be difficult to find a straight piece of only 10 feet in length, either in the trunk or branches of a tree 60 feet in height. It is rather short of foliage, the leaf being not unlike those of laurels; in the spring its flowers are as numerous as the leaves, and of a brilliant crimson, each flower of the size of a leaf; and the forest looks a mixture of dark green and bright crimson, certainly beautiful to behold."

The birds near the margin of the stream are few. A short distance inland the islands abound with ducks, geese, swans, turkeys, storks, cranes, snipe, &c., all so tame that they may be closely approached. At 98 miles from the mouth, the true mainland first approaches the right bank of the stream, and here is the town of St. Pedro, separated from the river by a lagoon, having an area of 300 acres, which some day will be converted into a fine harbour. At 170 miles from the mouth of the Paraná, near Rosario, is the straight reach of the river, where Mr. Revy's most important observations were made. The river here rises in flood about twelve feet, and the flood level is maintained for three months. There are, however, times when the flood level is maintained for twelve months, or even for two years. The highest floods rise about twenty-four feet above low water. During these, the whole delta is submerged, and the river forms a sheet of water thirty or forty miles in width. At 253 miles from the mouth, the termination of the delta is reached, and the mainland forms for the first time both banks of the stream. At 447 miles is the Alexandra Colony, where, amongst tigers and hostile Indians, 500 hardy Europeans, the pioneers

of their race, have established steam flour-mills and thrashing-machines. At 666 miles, the Paraguay falls into the Paraná, a fine river navigable for a thousand miles. Above the confluence of the streams, the territory of the ancient missions borders the Paraná. Mr. Revy gives an interesting account of these missions, now destroyed. When most prosperous, the population of the missions included about 100,000 Guarani Indians, under the absolute government of a few Jesuits of French, German, and English extraction; all good men, and well educated. They were nominally under the Spanish crown, but Spain surrendered them to Portugal in 1750. The Jesuits were expelled from the missions soon after the fall of their order in Europe. The missions then came under the rule of Spanish governors and Franciscan monks. From that time the missions rapidly declined. In 1817, the Portuguese governor of Rio Grande surprised the Guaranis, and destroyed everything in the missions by fire and sword.

The Uruguay, which also falls into the Plata, is a river of a very different kind. During low water the Uruguay is comparatively insignificant. Mr. Revy ascertained that in December the whole volume of its waters is confined within a rocky channel, near Salto, called the "Corralito;" the width of the stream is then 145 feet, and its depth 6 feet. But in flood, especially in the great floods of September and October, it rises 45 or 50 feet above ordinary low water, the flood rising often 3 feet in a day. "The Paraná is the type of a truly great river. The Uruguay represents a mighty torrent of extraordinary dimensions."

Mr. Revy's most important observations are those on the velocity of the currents. They were all made with an instrument known as Woltmann's mill, consisting of a small screw-propeller driving a counting apparatus. In the construction of the instruments which he used, Mr. Revy introduced several ingenious improvements, of which the most important appears to us to be, the enclosing of the counting apparatus in a casing filled with pure water. This entirely prevents the access of particles of grit to the counting arrangement. There is no doubt that Mr. Revy selected the best instrument for his special researches, and he is so convinced of the delicacy of his improved instrument, that he thinks it will register the velocity of currents moving at one-tenth of a foot per second. There is great difficulty in measuring the velocity of slow currents, and it is much to be desired that experiments should be made with the instrument, to ascertain the limits within which it can be trusted.

It does not appear that even the experiments by which Mr. Revy determined the constants for his instrument were very numerous or very consistent, and, in the absence of further information, we are not wholly convinced of the trustworthiness of such an instrument at velocities much below one foot per second. Mr. Revy obtains velocities, from the numbers given by the counter of the instrument, by means of a formula of the form $v = a + \beta n$. Now, on theoretical grounds, this is not the most probable form of the equation for this current

meter. With the meters hitherto used, it has been shown that it is not worth while to adopt a more complex equation. But, if the modified meter is as accurate as Mr. Revy believes, it would be very desirable to repeat the investigations of Lahmeyer and Baumgarten, with a view of determining whether a formula of a different form was not more accurate.

Mr. Revy expends a good deal of argument in showing that the current meter gives the velocity of streams much more accurately than floats. He naively admits that he had a decided prejudice against the use of floats. "We had a natural aversion to floats as a means to determine the currents of a river. It appeared to us a rough and ready way to observe currents." Mr. Revy's arguments against floats are somewhat theoretical, and we cannot help thinking that his aversion to floats is due, in some degree, to a wish to find an explanation for the fact that the extensive experiments on the Mississippi, which were made with floats, give results not quite consistent with his own. However this may be, and it being admitted that the current meter will give truer results than could be obtained by floats, *within the range of velocities for which it is applicable*, observations by floats are extremely useful to control other observations. If floats are not quite so accurate as other more complex instruments, at the same time they give the velocities of the currents directly, without the intervention of formulas and constants, and without liability to error from small derangements of mechanism.

The rivers on which Mr. Revy's observations were made were so large as to render his observations in some respects unique. In rivers of such immense width, we approach a condition often assumed in theoretical investigations, that, namely, of a stream of unlimited width, in which there is friction at the bottom, but in which the friction of the sides becomes insensible. We should bear this in mind in considering Mr. Revy's results.

The chief results of interest arrived at by Mr. Revy are these:—(1) The maximum velocity is *at* and not *below* the surface. In the Mississippi observations the maximum velocity was always found below the surface; in this they are completely at one with the experiments of Bazin, on open channels of small size, which were not made by floats, but by means of an instrument even more accurate than Mr. Revy's meter. Mr. Revy argues that the maximum current must be at the maximum distance from the retarding force acting at the bottom, and he puts on one side, as insignificant, the resistance of the air in contact with the surface. In this he is probably right, but he neglects to consider another cause which may modify and reduce the surface velocity. At the surface the particles of water have greater freedom of lateral motion than anywhere else, and the surface of the stream at right angles to its direction of motion is not level. Hence, there is a cause tending to produce a lateral mixing of the faster moving particles from the centre and the slower moving particles at the sides of the stream. It may be that in the great rivers this produces an insensibly small effect, but in that case the

observations on the Mississippi must be assumed to be erroneous. (2) The surface velocities at different points in the breadth of the stream are simply proportional to the depths of water at those points. This is certainly a very remarkable law, and was discovered almost entirely from observations on the Rosario section of the Paraná. We give the results of Mr. Revy's observations there in his own words:—

"If we measure the distances which the surface currents at the locality of the Rosario section travel in $13\frac{1}{2}$ seconds, anywhere across the line of section, these distances passed over by the current at any point are also the depths (of the river) at those points."

In the Uruguay "the currents reproduced their corresponding depths in $5\frac{1}{2}$ seconds." The chief point here is whether Mr. Revy's law is exact or only approximate. (3) The most remarkable result of the observations, however, is probably that which relates to the velocity of the stream at different depths. In previous researches the relation between the surface and subsurface velocities has been found to be somewhat complex, requiring an equation of the second degree at least to express it. According to Mr. Revy, however, the relation is the simplest possible. If we imagine a series of particles, occupying at any instant a vertical line in the stream, then, according to Mr. Revy, those particles, after a short interval of time, during which they have moved with varying velocities, will still occupy a straight line inclined to the horizon. Hence the velocities at any points, in the same vertical line, are proportional to the distances of those points from a point somewhere below the bottom of the river. Or, if x is the height of any fluid filament above the bottom of the river, its velocity is proportional to $a + x$ where a is a constant. We can offer no opinion at present as to this singular result, except that it is very desirable that it should be confirmed by further researches. That Mr. Revy has assumed a formula of the same kind, in reducing the revolutions of his current meter to velocities, might of itself give rise to a result of this kind, and hence the desirability of some independent means of checking the observations of the meter. One check of this kind Mr. Revy has himself applied. His method of obtaining the average velocity, which is perfectly novel and very ingenious, supplies, to some extent, a check on the observations at specific depths.

In conclusion a word of praise must be given to the admirable way in which Mr. Revy has represented his results graphically. These representations are reproduced by means of very admirable lithographs.

W. CAWTHORNE UNWIN.

NOTES AND NEWS.

Variation in the Length of the Sidereal Day.—In the *American Journal of Science* for September is given an important paper, by Professor Simon Newcomb, on the possible variability of the earth's axial rotation, with a discussion of M. Glasenapp's investigation of eclipses of Jupiter's first satellite as affected by such a variation in the length of the day. From his researches on the lunar theory, Professor Newcomb had been led to the conclusion that certain inequalities of long period must be accounted for in one of three

ways: Either (1) there are inequalities in the motion of the moon due to the gravitation of the sun and planets, which have hitherto eluded mathematical computation; or (2) the motion of the moon is affected by the action of some other forces than that of gravitation; or (3) the time of the earth's rotation on its axis, and, therefore, the length of its sidereal day, is subject to irregular variations of long period. The second hypothesis having been shown to be improbable, our choice lies between (1) and (3).

Now, evidently a variation in the length of the day would affect Jupiter's satellites in the same way as it does our moon; and, on account of its rapid motion, this effect would be most readily detected by eclipses of the first satellite. At Professor Newcomb's request, M. Glasenapp, of the Pulkowa Observatory, has carefully reduced all published observations of such eclipses from 1848 to 1873, making allowance for the different dimensions of object-glasses, and examined how far the supposition that the earth had lost eleven seconds on uniform time from 1844 to 1862, and had regained that amount in the next eight years, so that earth time was again right in 1870, would reconcile the observed times with those given by the best tables (Damoiseau's). The result is not favourable to this hypothesis, as the discordances are reduced by almost inappreciable amounts; and when M. Glasenapp attempts to find the error of earth time by the inverse process of making the observed times agree with the predicted as closely as circumstances would permit, he finds very different results, according as the disappearance or reappearance of the satellite was observed, and the deduced variation in the earth's rate of rotation is only half that required by Professor Newcomb's hypothesis.

After applying some corrections to Hansen's Lunar Tables, which reduce the amount by which earth time appears to be slow to $6^{\circ}.3$ at its maximum in 1862, Professor Newcomb, by a somewhat different treatment of the eclipses of the first satellite, makes a final attempt to reconcile the tables with observation, but without success. The existing theory of Jupiter's satellites appears to be too defective for such an investigation.

It may be remarked, that to explain an anomaly in the moon's motion by an anomaly in the earth's rotation is merely to defer the difficulty without removing it, while there are other discordances, represented by Hansen's empirical term depending on the action of Venus (which both Delaunay and Newcomb find by theory to be insensible), which seem to show that the mathematical theory of the moon's motion, especially where terms of long period are concerned, is far from complete.

The August Meteor Shower.—In the *Bullettino Meteorologico dell' Osservatorio del Collegio Romano* P. Ferrari gives an account of the meteors radiating from Perseus, which were observed at Rome, Casale and Alessandria, from August 8 to 12, no fewer than 710 having been seen on August 10, between 9 P.M. and 3 A.M., the greatest number noted in one hour being 168, or about two and a half per minute. The meteors seem to have been travelling in slightly different directions, but all included within a triangular space marked out nearly by the three stars α Persei, ϵ Cassiopeiae, and β Cassiopeiae. It is in the discussion of the exact form and dimensions of such radiant spaces, and their relation to the parent comet, that the interest of meteor observations now centres.

Spectroscopic observations of fifty of the meteors were made by Signor Arcimis di Cadice, the chief result being to show the presence of incandescent sodium vapour in the train; the spectrum of the meteor itself was generally continuous, but deficient in violet rays. This would seem to indicate a solid body at a temperature slightly below white heat. A meteorite observed on the same night (August 10) showed absorption lines on a continuous spectrum.

A Group of Meteorites.—Professor Tacchini, in the *Memorie de' Spettroscopisti Italiani*, describes

a curious group of meteorites which he observed on the evening of July 24. Three meteors as large as Jupiter were seen at first, and some seconds afterwards a fourth appeared suddenly; they moved at the same rate in parallel directions, and left brilliant trains behind them.

The Sun's Parallax.—Dr. Galle has reduced forty-three observations of the small planet Flora, as compared with neighbouring stars, made at three southern and nine northern observatories for determination of the sun's parallax, in accordance with a suggestion made by him last year. Although the parallax of the planet Flora is only about one-third of that of Mars when nearest to us, the observation of a small point of light is so much more accurate than that of a planetary disk that Dr. Galle expected to get valuable results from corresponding measures made in the two hemispheres, though, of course, the approaching transit of Venus, if successfully observed, will give a far more trustworthy determination. From the whole forty-three measures of Flora Dr. Galle finds a parallax of $8''.923$, striking out eight observations which differ more than $1''$ from the mean, he gets $8''.907$; striking out thirteen which differ more than $0''.75$, he obtains $8''.858$, the value which he considers most probable. If all the measures which differ more than $0''.5$ from the mean are rejected, reducing the number used to twenty-one, the value $8''.851$ is obtained, while from eleven observations which show a discordance of less than $0''.25$ a parallax of $8''.841$ results. As no reason whatever is given for rejecting the discordant observations, and as no criterion is fixed, the process seems to be somewhat arbitrary, and the close agreement of the adopted value $8''.858$ with Leverrier's indirect determination from the earth's action on Venus and Mars, and with other direct results obtained in recent times, must be looked upon as accidental. The investigation, however, shows, as Dr. Galle points out, that the value found is probably true within a few hundredths of a second, which is in itself a satisfactory result of the application of this new method. Dr. Galle hopes to obtain still more accurate results from observations of one of the fainter minor planets, Flora being rather too bright for accurate bisection with a spider line.

Measures of Sirius and its Companion.—From some recent observations of the minute star about which Sirius appears to be revolving, Mr. Wilson, of Rugby, has deduced a period of revolution of 200 years in an orbit fifty times that of the earth, which would make the sum of the masses of Sirius and its companion rather more than three times that of the sun, whilst the light of the star is more than 200 times that of our sun. The disproportion in brightness between Sirius and its faint companion appears to be the result of the high temperature of the former, and not of any great difference in size, since from the observed proper motions of Sirius in space, the centre of gravity about which both stars revolve is found to be one-third of the distance from Sirius to its companion, which latter would therefore appear to have a mass half that of Sirius, or about equal to that of our sun. In all this there is much uncertainty, Auwers having found for Sirius a period of fifty years, and a mass twelve times that of the sun, and very liberal allowance must be made for errors of observation, caused by the overpowering light of the bright star.

The Parallax of Groombridge 1830.—In a paper communicated to the Academy of Sciences of Berlin, Dr. Auwers has discussed Johnson's observations with the Oxford heliometer of the star Groombridge 1830, which on account of its large proper motion was considered likely to have a large annual parallax. Johnson, however, found that though its parallax appeared to be greater by about three-tenths of a second than that of one star near it, it was less than that of another star, from which its angular distance was measured,

by nearly the same quantity, a result which would indicate, if the observations could be relied on, that the star Groombridge 1830 was at such a distance from us that light would take not more than ten years to reach us from the star, while from the second star above referred to it would take less than five years; but the most probable conclusion would be that the measures were affected by such errors that no certain inference could be drawn as to the parallax except that it was very small. With the view of eliminating these errors if possible, Dr. Auwers has undertaken a fresh reduction of Johnson's observations, with an elaborate discussion of the probable errors, and of the effect of a change in the magnifying power from 200 to 150 made in the course of the observations. The net result of the whole investigation is substantially to confirm Johnson's deductions from his observations, though these differ much from the results of other observers, who have found a parallax of a tenth of a second, corresponding to a distance which would be traversed by light in some thirty years. Astronomers can hardly answer for such a quantity, but, adopting this matter provisionally, the star would be moving in space at the enormous rate of half a million of miles an hour, or eight times the velocity of the earth in its orbit.

Micrometrical Observations of 500 Nebulae.—When attention was first directed to the nebulae, the object was rather to determine the laws of their distribution and their physical characteristics than to attempt to fix their positions accurately, though the latter is a matter of great importance to our knowledge of these strange objects, as by such observations we may hope in time to determine their proper motions, and thus to get a notion of their probable distance, even if we cannot find it directly by observations for parallax. This work Dr. Schultz of Upsala has taken up, and now presents the results of more than eleven years of observation in a memoir, of which he has had a version printed in English.

The advance in point of accuracy made by Dr. Schultz is very marked, and shows that the uncertainty inherent in the observation of these objects has been very much over-estimated. Thus, while Sir W. Herschel's observations are subject to a probable error of $1''$ or $2''$, which in Sir J. Herschel's and D'Arrest's large catalogues is reduced to $20''$, and in smaller catalogues by D'Arrest and Laugier to $6''$, the results in this memoir are probably true to $1''$, even when the nebula has only been observed on a single evening. This is a great improvement on any previous catalogue, one of the best of which, that of Schönfeld, containing 235 nebulae, is liable to errors of $2''$ or $3''$, whilst the probable error of Dr. Schultz's results is less than three times that of a meridian observation of a star with a modern transit circle.

The instrument used by Dr. Schultz was the Upsala thirteen feet refractor, with which over 12,000 individual measures were made from 1863 to 1874, notwithstanding great interruption to the observations of such faint objects from twilight in summer, and the aurora in winter, not to mention the moon. In fact, Dr. Schultz concludes that Upsala is about the worst location possible for an observatory, and this assertion is borne out by the fact that he was only able to get observations on 400 nights altogether, or thirty-five a year on the average, and these included many unfavourable evenings. On account of this climatic difficulty the work is not yet complete, the positions of the stars used for comparison with the nebulae not having been in all cases accurately determined, so that the definitive positions of the nebulae are not given, but only their places as referred to these comparison stars. All the measures were made with the parallel line micrometer.

Though the catalogue is not as extensive as Dr. Schultz originally hoped to make it, yet it is by far the largest in which accuracy of the positions has been aimed at, and forms a really fundamental catalogue which only needs enlarging.

DR. ASCHERSON has recently published (*Botanische Zeitung*, pp. 609-647) a preliminary report on the botanical results of Rohlf's expedition for the exploration of the Libyan desert. The geography of the district traversed has already been described in this journal. Respecting the vegetation we are told that it is the most barren and desolate part visited by Rohlf in all his travels in the Sahara. In some places there is an almost absolute absence of vegetation, and the whole number of species of plants collected in the desert proper, that is to say, at least an hour's journey from either of the oases, was thirty-two, belonging to fourteen different orders. With the exception of three, all of them have been determined. One of the undetermined is perhaps a new species of *Zygophyllum*, and the affinities of the others are not indicated; but it seems highly probable that not a single new species was discovered. This is a remarkable fact, but still not very surprising when we consider the geographical range, or area of distribution, of most of the desert plants. Twelve of the plants named were found only in one place, and most of these were represented by few individuals, hence they constitute no striking feature of the general flora of the desert. *Fagonia arabica* and *Aristida plumosa* were exceedingly common, reappearing with wearisome monotony. It is scarcely necessary to mention that most desert plants assume a habit and peculiar development of their organs adapted to the conditions under which they exist. The peculiarities consist in a dense habit of growth, a development of spines, and a suppression of leaves or their transformation into fleshy organs. We may add a few words respecting the general distribution of the plants found by Ascherson. In the first place, desert plants generally, i.e. those of the Great Sahara, and the deserts of Arabia and Western Asia, have mostly a considerable range of distribution. Thus, twenty-two of the species collected by Ascherson extend to Asia, in addition to their distribution in Africa, and many of them to Beloochistan, Afghanistan, Turkestan, and even farther to the north-east. Two extend to the Canary Islands, and two to the north shore of the Mediterranean. An extreme example is furnished by *Fagonia cretica* (including *F. arabica* and other synonyms), which occurs throughout the warmer parts of Asia, South Africa, the western side of North and South America, the Canary Islands, and South Europe. The leaves of the grasses mentioned above are rigid and sharp-pointed. Some of the shrubby inhabitants of the desert, notably *Tamarix*, possess the power of emitting roots from any part of the stem, and as the shifting sands drift between them, they usually form hillocks. Dr. Ascherson states that they are frequently from ten to sixteen feet high. Near the oases plants become more numerous, and the oases themselves are in most cases very carefully cultivated.

Wheat and barley are grown in winter, and rice and durra (*Sorghum vulgare*) in summer, with intermediate crops of clover, cotton and indigo. The gardens are enclosed with mud walls, topped with a network of the leaves of the date palm or the formidably armed branches of *Acacia nilotica*, or fenced in with the interwoven branches of *Acacia*, *Capparis*, &c. The most important fruit cultivated in the Libyan oases is the date, and it is said to be far superior in flavour to the variety grown in the Nile valley. Oranges and lemons of excellent quality, also apricots, and in smaller quantity peaches, apples, figs, sycamore figs, plums, mulberries, pomegranates, carobs, Indian figs, nabak (*Zizyphus Spina-Christi*), muchet (*Cordia Myra*), and grapes are grown. The principal timber tree is *Acacia nilotica* (referred to as *A. arabica* in Oliver's *Flora of Tropical Africa*). Dr. Ascherson measured one at Balat which was nearly eighteen feet in circumference, and which he supposes to be the same tree measured by Edmonston in 1819. Among useful herbaceous plants cultivated we may note—cumin, rape-seed,

radish, mallow (*Malva parviflora*), bammia (*Abelmoschus esculentus*), meluchia (*Corchorus trilobularis*), lupins, lucern, peas, beans, wild cucumbers, water-melons, coriander (as a vegetable?), tomatos, egg-plant, &c. &c. Ornamental plants, with the exception of a few roses in the gardens of the rich, are unknown in the oases. As a special mark of distinction a rose was presented to Rohlfs by the Scheik el Beled on the occasion of his leaving at Dghakel.

The wild vegetation of the oases exceeded expectations. Ninety-two species were found in Farafreh, 180 in Dghakel, and Dr. Schweinfurth collected 225 in Khargeh. It would take us too far to enumerate beyond a few of the more remarkable plants. Naturally a great many of them are weeds of cultivation, and would disappear if cultivation were discontinued. A few new species were discovered, but they are closely allied to familiar forms. Characteristic plants are *Citrullus Colocynthis*, *Calotropis procera*, *Capparis aegyptiaca*, *Sodaa decidua*, *Prosopis Stephaniana*, *Cassia obovata*, &c., as well as most of the plants found in the actual desert. *Conyza Borei*, hitherto only reported from Sinai and Abyssinia, was discovered; and the true *Cyperus Mundtii* was also found. Two new mosses, *Bryum Aschersonii*, C. Müll., and *B. Korbianum*, C. M., were detected near Dghakel; and three new species were found in the vicinity of Sioot, viz., *Weissia Rohlfsiana*, *Bryum Remelei*, and *Entostodon curvicaulatus*, C. M.

Dr. Ascherson gives complete lists of all the plants observed in each of the oases, with indications of their distribution, &c., and concludes with some interesting remarks on the fall and renewal of the leaves of deciduous trees. It is worthy of note that he discovered fruits of *Balanites aegyptiaca* in some of the tombs near Dghakel, as the same fruit occurred amongst others sent to Kew from Thebes.

THE fact that the National Horticultural Establishment at Kew is actively engaged, among other things, in propagating the new Liberian coffee plant, and sending it to various parts of the Empire where coffee is cultivated, to replace the variety commonly grown, is perhaps of more commercial than scientific interest. The demand for this new variety appears to depend more upon its vigorous constitution than its superiority in other respects, though it is described as excelling the old variety both in fertility and flavour. But the original cause of this demand is of the utmost interest to the physiologist and the enquirer into the laws governing the appearance and disappearance of certain forms of vegetable life. We are constantly hearing complaints from the vineyards and orange orchards of Europe, as well as from the coffee plantations, &c., of the tropics, of the losses attributable to an enfeebled constitution, the result of long cultivation and in-breeding, as it were, of the same varieties. All the facts seem to indicate that races of plants, like races of animals, gradually die out, and more rapidly under certain conditions. The Liberian coffee is a variety of the same species as the common coffee; and the North American vines, that suffer very little, or not at all, from the attacks of the *Phylloxera*, are closely allied to the European species.

ONE of the most interesting of recent additions to the excellent botanical museum at Kew is a series of sections of the tuberous rootstocks of the remarkable Rubiaceae epiphytical genera, *Myrmecodia* and *Hydnophytum*. Both genera have long been imperfectly known from the figures in the *Herbarium Amboinense* of Rumphius, and also the peculiarity that the tuberous thalloid base, or rootstock, serves as a nest for ants; but late explorations in the Pacific islands and tropical Australia have furnished more complete materials and revived the curiosity of naturalists. Since the publication of Darwin's works, botanists have been paying far more attention to the innumerable

modifications of the various organs of plants, and their adaptations to certain ends. The investigation of this class of biological phenomena is of the most attractive, and we believe Mr. James Britten, of the British Museum, is at the present time engaged upon a paper treating not only of the genera mentioned, but also of the Melastomaceous plants whose leaves are provided with vesicles at the base, the hollow-stemmed *Cecropia* and *Triplaris*, and the Acacias with hollow stipular spines, all of which afford shelter to different species of the Formicidae. We look forward with much interest to the appearance of the paper in question, as the little known to naturalists on this subject is scattered about in various books of travel.

BOTANISTS will be pleased to learn that the plants of Gay's herbarium, presented to the national collection at Kew by Dr. Hooker, are now nearly all incorporated and available for use. This collection is extremely rich in European species, and many curious cultivated plants, in which Kew was relatively poor.

WE understand that Mr. Melliss' work on the natural history of St. Helena is rapidly approaching completion. It is not to be of a purely scientific character; in fact, it will be adapted to the demands of the general reader. Nevertheless, the peculiarities of the flora, &c. will not be neglected. Nearly all of the indigenous plants are absolutely endemic, and some of them are now only known in the dried state, while others are fast disappearing and must soon become extinct. Plates will be given of the endemic species. It is satisfactory to know that the Kew Herbarium contains a tolerably good series of specimens of most of these interesting plants that have come to the knowledge of botanists; but Dr. Hooker (*Insular Floras*, p. 7) computes that probably a hundred peculiar species were extirpated before botanists had an opportunity of investigating the vegetable products of the island.

MEETINGS OF SOCIETIES.

LINNEAN SOCIETY (Thursday, November 5).

G. J. ALLMAN, M.D., President, in the Chair. Mr. J. G. Baker followed up his previous papers on the sub-orders Liliaceae and Tulipaceae of the Liliaceae by a very elaborate treatise on the sub-order Asparageae and the remaining small groups referred by him to the Liliaceae. Under this order Mr. Baker includes the Gilliesiaceae, Melanthaceae, Trilliaceae, Roxburghiaceae, &c., of other authors, a course that is scarcely so convenient for practical purposes as a separation into smaller orders, and one that many botanists will probably not accept. Doubtless there is some difficulty in assigning the limits of the smaller groups as independent orders. The Smilacaceae are not associated with the Liliaceae by Mr. Baker, as is done by some botanists. On the other hand, Lindley's class of Dictyogens cannot be maintained. One of the distinguishing characters of the Liliaceae and Smilacaceae is in the ovules, and this holds good for all that have been examined: in the former they are anatropous and in the latter orthotropous. The curious tribe of Aspidistreae having a mushroom-like stigma, completely shutting in the stamens, which are sessile at the base of the perianth, puzzled Mr. Baker as to the manner in which impregnation is effected. Some of these plants are quite hardy in this country, and, therefore, this point might easily be investigated.

ROYAL ASTRONOMICAL SOCIETY (Friday, Nov. 13).

At the first meeting of the session, which was held in the new apartments in Burlington House, Professor Adams, President, in the Chair, Sir George Airy gave an account of the present state of the Transit of Venus enterprise. He began by calling attention to the expedition equipped on such a splendid scale by Lord Lindsay for obser-

vation at the Mauritius; and then remarking that no change whatever had been made in the original plan, although assertions to the contrary have more than once been made, gave a statement of what was known of the proceedings of the various parties at the five stations selected by Great Britain—viz. Egypt, the Sandwich Islands, Rodriguez, New Zealand, and Kerguelen Island.

In Egypt the chief station is to be Cairo, where Captain Ord Browne, R.A., is quartered, with Thebes as a subsidiary station for the photo-heliograph under Captain Abney's management, Mr. Hunter being charged with the telegraphic arrangements at Alexandria and Suez, for determining by telegraph the longitude of Cairo referred to Greenwich, and of Aden referred to Cairo. Thanks to the good offices of Lord Derby, the Khedive has shown the greatest attention to the party, and has placed the railways and telegraphs at their disposal, besides lending a government steamer for the transport of Captain Abney's detachment to Thebes, and, what is perhaps of equal importance, providing a guard for the protection of the instruments. If all goes well, it is hoped that a telegram will be received at Greenwich before sunrise of December 9, announcing the success of the Egyptian expedition.

With regard to the Sandwich Isles, the only information received as yet is, that the party had arrived safely, and been presented to his Majesty the King, who had assigned Captain Tupman a plot of ground on which the instruments for the principal station were being erected. The auxiliary stations would be at Hawaii and Niihau, the two extreme islands of the group, where Professor Forbes and Mr. Johnson are to be located respectively.

At Rodriguez, Lieutenant Neate, R.N., has overcome the difficulties of landing delicate, though heavy instruments over a coral reef, and has co-operated with Mr. Gill, Lord Lindsay's able assistant at the Mauritius, in determining the difference of longitudes of their stations by means of Lord Lindsay's forty-three chronometers, which have been twice carried backwards and forwards between the two islands by Commander Wharton, of H.M.S. *Shearwater*. Of the New Zealand expedition nothing has been heard, except that their ship, the *Merope*, had arrived safely. The Kerguelen party, under Father Perry's charge, have not been quite so fortunate as the others, having been detained two months at the Cape by the break-down of the ship which was to carry them on; however, they got off eventually on September 18, but in consequence of this delay the Americans and Germans would be first in the field, and thus get the first choice of stations. In order that news of the observations of the transit may be received as soon as possible in this country from Kerguelen's Island, Messrs. Green have very liberally offered to let one of their ships call on the way to Australia, though the island is somewhat out of the usual track. A telegram can then be sent from Melbourne. In conclusion, Sir George Airy pointed out the great importance of accurate determinations of longitude, even where both ingress and egress would be observed, and corrected some erroneous opinions which had been published on this point. Remarking that it was not more than an even chance that the weather would be fine at a particular station for any definite observation, according to the experience both of M. Struve and himself, he pointed out that it was fifteen to one against its being fine both for ingress and egress at each of two selected stations, while it was an even chance that ingress would be observed at both stations, or that egress would be similarly observed. That is to say, the chance of getting useful observations in the case considered would be one half if the longitudes of the stations were determined, but only one-sixteenth without them. It was, he supposed, from a tacit recognition of this fact that the Germans laid such stress on the determination of the longitudes of their stations, that they were willing to undergo the

labour and expense of working out a most elaborate network of telegraphic longitudes.

A letter from Professor Newcomb, U.S.N., was read, giving an account of the state in which Delaunay left his great work, *The Lunar Theory*. From this it appeared, that though the greater portion was complete, there remained much to be done before tables could be formed, and this work it was understood that M. Loewy, of the Paris Observatory, was prepared to undertake.

Mr. Dunkin, the honorary secretary, then read a paper by Professor Asaph Hall, U.S.N., which provoked some discussion. The author sought to prove that Sir W. Herschel had actually observed Ariel and Umbriel, the two interior satellites of Uranus, and was therefore the discoverer of these as well as of the other two, a view which Mr. Lassell, the discoverer of the two satellites in question, was inclined to dispute.

There were a large number of communications which were taken as read, and which will appear in the forthcoming number of the *Monthly Notices*.

NEW SHAKSPEARE SOCIETY (November 13).

F. J. FURNIVALL, Esq., Director, in the Chair. The paper (read by Mr. Alexander J. Ellis) was by Professor J. K. Ingram, LL.D., of Trinity College, Dublin, "On the *Weak Endings* of Shakspeare," with some account of the history of the Verse-Tests in general. The sixteen *weak endings* are "and, but (= *L. sed*, and = *except*), by, for, from, if, on, nor, or, than, that, to, with." The fifty-four *light-endings* are "am, are, art, be, been, but (= *only*), can, could, did, do, does, dost, ere, had, has, hast, have, he, how, I, into, his, like, may, might, shall, shalt, she, should, since, so, such, they, thou, though, through, till, upon, was, we, were, what, when, where, which, while, whilst, who, whom, why, will, would, yet (= *tamen*), you." The following is an extract from the Professor's table of these endings in Shakspeare's late plays, whose order alone they help to settle:—

	No. of light endings.	No. of weak endings.	No. of verse lines in play.	Percentage of light endings.	Percentage of weak endings.	Percentage of both together.
Macbeth	21	2	—	—	—	—

COLLEGE FOR MEN AND WOMEN, QUEEN SQUARE, BLOOMSBURY (Saturday, November 14).

MR. NEWTON, of the British Museum, lectured on Greek Inscriptions. After an introductory sketch of their collection and publication, the lecturer drew attention to their great historical and philological value, and to the consequent increased use of them by contemporary scholarship. Having stated that Greek inscriptions might be divided into the three great groups of political, religious, and private, he spoke in some detail of those of Athens. The most important of the Athenian inscriptions were the tribute-lists, the study of which had led to very interesting historical results; the treasure-lists, which showed the practical genius of those who drew them up; and the lists of the dockyard.

The historical inscriptions of other Greek States were then noticed, particularly those bearing on the relations of sovereigns and free cities, arbitrations, public services, the institution of proxeni,

and, descending to the Roman dominion, the letters of the Emperors and their other public manifestoes. Mr. Newton next passed in review inscriptions relating to Greek religious rites and to the manner in which land was held under temples, and slaves were freed by sale to a divinity, and also the inscriptions found on dedicated objects. He concluded with a reference to those inscriptions which, though not of a monumental character, had an historical value—such as the tax-gatherers' receipts in Egypt written on potsherds and the stamped handles of wine-jars, by which we can trace the lines of ancient commerce in the Mediterranean and the Euxine.

ENTOMOLOGICAL SOCIETY (Monday, Nov. 16).

J. W. DUNNING, Esq., M.A., F.L.S., Vice-president, in the Chair. Mr. Higgins exhibited some rare species of Cetonidae from Borneo; among them were *Lomaptera Higginsii*, O. Janson, and a remarkable Dynastiform insect, named by Count Castelnau *Westwoodia Howittii*. Also two smaller specimens which had been supposed to be females of the last-named species, but were, more probably, females of an unknown species. The secretary exhibited a collection of fine species of Lepidoptera from Natal, which had been sent by Mr. W. D. Gooch for determination. The Rev. O. Pickard, Cambridge, sent notes on the curious spider's nest exhibited at the last meeting. It was unknown to him, and had it not been for a remark in Mr. Ward's letter implying that the nest he found belonged to a geometrical web, he should have conjectured that it was the work of an *Agelena*. If, however, the nest was appurtenant to a geometrical web, it must belong to a spider of the family *Epeiridae*. He did not think the sand in the nest was at all designed as ballast, but as a protection from the rays of the sun, and also from parasites. Mr. Smith remarked that the mud-coating of the nest of *Agelena brunnea* did not preserve that species from parasites, as he had often bred a species of *Pezomachus* from the nests; and he believed, in those cases, the eggs were attacked before the mud coating was added. Mr. Champion exhibited some rare species of British Coleoptera, viz., *Apion Ryei*, *Abdera triguttata*, *Lymexylon navale*, *Athous subfuscus*, *Sylvanus similis*, and *Apion sanguineum*.

GEOLOGICAL SOCIETY (Wednesday, November 18).

J. EVANS, Esq., F.R.S., President, in the Chair. Evidence was brought forward by Professor Owen, tending to show that a peculiar form of "sea-cow," or Sirenian Mammal, existed in the shallow waters from which the upper part of the Egyptian Nummulitic Limestone was deposited. The evidence consisted of part of the cranium, and the cast of the interior representing the entire brain and the base of the myelon. These parts sufficiently show that the creature to which they refer was allied to the manatees and dugongs of the present day, to the recently extinct *Rhytina Stelleri*, and to the fossil *Halitherium*. Professor Owen's fossil, which he terms *Eotherium Aegyptiacum*, was obtained from the limestone which is quarried in the Mokattam cliffs, south of Cairo, and is of special interest as carrying the range of the *Sirenia* back to Eocene times.—In a paper "On the Geology of North-West Lincolnshire," the Rev. J. E. Cross described the structure of a district bounded on three sides by the rivers Humber, Trent, and Ancholme. The chief physical features are three escarpments running north and south, and presenting bold faces to the west. The valley of the Trent is excavated in Keuper beds, and no representatives of the Rhaetic series have yet been found between these beds and the overlying Lias. In the lower zones of the Lias are found such fossils as *Ammonites angulatus*, *A. Bucklandi*, and *A. semi-costatus*. A band of ironstone, largely worked around Frodingham and Scanthorpe, is shown by the associated fossils to be referable to

the lower portion of the Lower Lias, and has therefore no geological connexion with the celebrated Cleveland ironstone which occurs in the Marlstone, or Middle Lias. The Lincolnshire ore is highly calcareous, and consequently needs to be mixed with siliceous ores, in order to be advantageously smelted. The ore worked at Caythorpe, near Grantham, may be on the same geological horizon. Following the Lincolnshire ironstone is a blue marl containing such fossils as *A. oryctus*, which is succeeded by a seam of iron ore charged with pectens. The Middle Lias is not strongly represented, but contains characteristic fossils; one part being termed the "Rhynchonella bed," in consequence of the prevalence of *R. tetraëdra*. Above the Upper Lias comes the "Lincolnshire Limestone," representing the Inferior Oolite; and this is succeeded by strata on the horizon of the Great Oolite and Cornbrash. East of the valley of the Ancholme the Chalk sets in, and rises into the range of the Lincolnshire Wolds. The author exhibited a number of finely-preserved fossils, including several new species which await description.

FINE ART.

RECENT CONTRIBUTIONS TO DÜRER LITERATURE.

(Second Article: *Dürer's Enigmatical Engravings*.)

Dürer Studien. Versuch einer Erklärung schwer zu deutender Kupferstiche A. Dürers. Von Max Allihn. (Leipzig, 1871.)

Dürer Studien. Four Articles contributed to the *Zeitschrift für Bildende Kunst* in 1873 and 1874. By Adolf Rosenberg.

A MORE scientific method of enquiry than the idle process of riddle-guessing so long in vogue has at the present day been brought to bear upon the enigmas of Dürer's art. These enigmas have from the earliest times severely taxed the ingenuity of commentators. Endless are the speculations to which they have given rise, and the hypotheses that have been framed to explain them; but, strange to say, no perfectly satisfactory interpretation has ever yet been offered of Dürer's meaning in several of his smaller, and two or three of his larger and best known engravings. "Dürer," wrote F. von Schlegel in his *Reise-Beschreibungen*, "appears to me like the originator of a new and noble system of thought, burning with the zeal of a first pure inspiration, and eager to diffuse his deeply-conceived and probably true and great ideas." If so, it were, indeed, to be lamented that these ideas should be lost for want of understanding the system of thought that originated them. But there is no reason to suppose that Albrecht Dürer, like Leonardo da Vinci, forestalled by his intellectual insight the development of a later age; if, therefore, we find thoughts and feelings ascribed to him that were not the natural growth of his time and country, we may well doubt that they were his. His meaning will much more likely be found by studying the culture of the age in which he lived, by observing the influences at work in the circle in which he moved, and by comparing his work with that of other artists with whom he was likely to have had common associations. Several German commentators have of late been making researches in this direction, and this is the point of view from which Dr. Max Allihn in particular criticises former interpretations of several of the most difficult of Dürer's prints, and

offers his own solution of their meanings. He has searched in the writings of moralists and humourists, of Minnesingers and Meistersingers, for elucidations of the thought of the artist, and has found many analogies between the conceptions of other German masters who delighted in allegory and those of Dürer.

The symbolism of the large print usually called *The Great Fortune*—but considered by Hausmann, Passavant, Eye, Von Retberg, and many other writers, to be the *Nemesis* mentioned so often in Dürer's journal, has certainly been placed almost beyond doubt by Dr. Allihn's thorough method of investigation. The difficulty in the way of accepting it as Fortune has always been that the naked female figure standing on a ball in the clouds, and holding in her hands a chalice and a bridle, has none of the attributes of the blind goddess—none of the attributes, at least, by which we are accustomed to recognise her. But it seems that, in the fifteenth century, it was by no means uncommon to represent Fortune standing on a ball, or with a ball as her attribute. Several middle-age poets speak of the ball as well as of the wheel of Fate. The latter symbol was, it is true, most common; but it is easy to understand that, for artistic purposes, the former might be more serviceable. The chalice and the bridle are not so easily explained. The chalice, however, is not unfrequently met with in art as expressive of riches or well-being, and also as meaning the temptation of riches—as, for instance, the golden cup that the woman of the Apocalypse holds in her hand. The bridle, on the other hand, is an emblem of oppression, slavery, and perhaps of resistance opposed to temptation. In an engraving by H. Aldegrever we have a figure very similar to Dürer's Great Fortune—evidently, indeed, inspired by it—holding in one hand a chalice, and in the other a serpent, with a bridle hanging over the arm that holds forth the chalice. Several other variations of this conception occur in German art, but the most remarkable is a figure by Holbein that Max Allihn has found in a border illustration of a book published by the celebrated Frobenius, of Basel, in 1532.

The Table of Cebes, an allegorical representation of human life often employed in the Middle Ages, is the subject of this border, and in it Holbein has depicted Fortune as a winged figure standing on a ball in the clouds, and holding in her hands exactly the same emblems as Dürer's Fortune. The outward form of the two figures is somewhat different, but the idea is unmistakably the same, and as if to leave no doubt as to the signification of this idea, Holbein has written in plain characters above the head of the goddess the name *Fortuna*. Moreover, two groups of mortals lie to the right and left: the poor, miserable, and oppressed, over whom the bridle is suspended; and the rich and happy, decked in fine clothes and feathers, to whom the chalice is offered, but whose condition may quickly be altered by the rolling of the ball.

Here, then, we have a plain solution of the difficulty; for if a figure holding bridle and chalice meant Fortune in Holbein's language, it is natural to suppose it meant the same

in Dürer's. But if so, how reconcile this view with the Nemesis theory? Dürer undoubtedly called one of his larger prints *Nemesis*, and what other remains that he could possibly have so designated? Dr. Max Allihn's method is here of great service, for it leads to the induction that Dürer meant by his Nemesis not the avenging goddess of the Greeks, but a Fate goddess, who distributes alike both good and evil—a conception not at all at variance with the understanding of his time. Thus Erasmus, in the *Encomium Moriae*, speaks of "Rhamnusia rerum humanarum fortunatrix;" and Vincenzo Cartari, in his *Imagini dei Dei degli Antichi*, describes her as "la Dea che punisce i maluagi e dà premio ai buoni;" and in another place, "Nemesi . . . opprime i troppo superbi e solleva gli humili."

This exactly tallies with Dürer's idea of a goddess who is the disposer of human things, of a "Fortuna-Nemesis," as she is called by Dr. Max Allihn, who may really claim to have propounded a well-founded theory concerning this print, in place of the unverified hypotheses of numerous other commentators. The late Mr. Holt's wonderful story, by which he made out the figure to have been designed by Dürer to represent Margaret the Regent of the Netherlands, must, it is to be feared, fall to the ground, with his other clever invention, by which he proved, to his own satisfaction at all events, that the *Knight, Death and Devil* was the Nemesis.

The interpretations that Dr. Max Allihn offers of some of the other enigmatical engravings are not quite so satisfactory. It is difficult, for instance, to accept the subject known variously as the *Four Naked Women*, the *Three Graces*, and *The Witches* (Bartsch 75; Heller 861), as a representation of Female Vanity; for, in spite of the elaborate head-dresses of these perplexing ladies, it is impossible to imagine that their charms can have led them to the sin of vanity. Four more ugly female figures have seldom been depicted, and it seems much more likely that Dürer intended by them some reference to the terrible belief in witchcraft that was one of the curses of the Middle Ages. Dürer's monogram appears in the corner of this plate, but it has been supposed by several commentators that it was merely copied by him from an earlier master. It is just possible that the mysterious letters O.G.H., that appear beneath the hanging ball with the date 1497, were the initials of the unknown artist, and the date also that of the time at which he executed the work; for, as Nagler has pointed out, the engraving of the *Four Naked Women* belongs in execution to Dürer's later rather than to his earlier time; and it is therefore strange to find it dated 1497, the earliest date on his copper-plates.

Neither is the explanation very plain by which the naked man who sits on a bank holding in his grasp a woman dressed in the costume of the early part of the fifteenth century (Bartsch 93; Heller 893), is made out to be an Incubus. Far more probable seems Herr Adolf Rosenberg's interpretation of the subject as an impersonation of Envy. This solution of the riddle has, at all events, the advantage of being an old one, for Herr Rosenberg has found on a copy of the print

in the Berlin collection the inscription *Der Neidhart* in old and nearly effaced Gothic characters. A verse in Sebastian Brand's *Narrenschiff* also describes Envy as having

" . . . Ein bleichen mund
Dürr, mager, er ist wie ein hund
Sein augen rot und sieht nieman
Mit ganzen vollen augen an,"

a description that entirely agrees with the repulsive wretch Dürer has drawn.

Herr Rosenberg is the latest interpreter of the Dürer enigmas. In four articles, entitled "Dürer Studien," contributed at various dates since May, 1873, to the *Zeitschrift für Bildende Kunst*, he has carefully analysed the prints known as the *Woman* and the *Wildman* (called by Bartsch *Le Violent*, and by Von Retberg *Der Tod*), which, as before said, he interprets as Envy; the offer of Love (Bartsch 93; Heller 891), interpreted as a warning against unequal marriage. The *Four Naked Women* construed as a Death dance, and the *Great Fortune*, concerning which he agrees in the main with Max Allihn, but brings forward arguments to prove that the Fortuna is a portrait of a member of the Tucher family.

None of these solutions except the first has much novelty, nor are the prints they seek to explain of any great interest.

Strange to say, neither Max Allihn nor Rosenberg attempts to solve the mystery of the subject known as the *Knight, Death and Devil*. This celebrated print, more than any other, perhaps, has puzzled the wisdom of commentators. Vasari calls it a symbol of Human Fortitude, and it has sometimes gone by that name; others have seen in it a representation of the Christian Knight (another of its titles), while others, again, taking a different view of the Knight's character, describe him as an evil man going forth on some bad errand, for whom Death and the Devil are lying in wait.

Von Eye considers that Dürer probably had in his mind the personification of the noblest type of German character, and recognises in the Knight "the upright German man who will not be restrained from realising his idea by the depths and horrors of life;" and Dr. Waagen decides that "ni la Mort ni le Diable n'arrête un brave et loyal chevalier."

All these interpretations, and many more that might be quoted, are based on the assumption that Dürer had some profound ethical meaning in his *Knight, Death, and Devil*. But is this certain? No doubt he meant to teach some moral lesson by it, but may not this lesson have been simply the solemn truth so frequently insisted upon by the art of his time, that "in the midst of life we are in death"? The skeleton of Death was a familiar image in the fifteenth century. In Holbein's famous *Dance* we see the ghastly figure discrediting the Emperor, lurking behind the preacher in the pulpit, robbing the miser of his gold, seizing the Friar by the hood, and conquering the mighty noble. In the Death dances of other artists, and in other moral representations of the age, we find the same lesson enforced. In Dürer's own art also, death is often present. While a loving fifteenth-century couple are taking a quiet walk (Bartsch 94; Heller 884), Death peeps out at them from

behind a tree; in one of his drawings, Death is looking over the shoulder of a young lady who is adorning herself at a looking-glass; and in the coat of arms known as that of the "Death's Head," a skull is the only emblazonment on the escutcheon.

This idea of Death as the all-powerful was, indeed, ever lurking in Dürer's mind, and the *Knight, Death, and Devil* may be taken as the noblest expression of it. An armed knight rides forth on some bold enterprise, confident in his own strength, and with his will resolutely set towards the accomplishment of some definite purpose. But Death on his lame horse keeps up with the rider, and the Knight's strength will be of no avail and his purpose never accomplished. The foul fiend that follows so close behind does not necessarily indicate that this purpose was a bad one, as many commentators have supposed, for the same kind of one-horned animal-demon pokes at Christ with a spear in that strange engraving of the Passion series, *Christ's Descent into Hell*. In this latter subject Satan is evidently "wroth to see his kingdom fail." Dürer, in his journal, calls the *Knight, Death, and Devil* simply *Ein Reiter*. He mentions it twice.

The *Melancholia* is another enigmatical print that has given rise to endless conjecture. Dr. Max Allihn brings much additional evidence to show that Dürer meant it as a representation of one of the Four Temperaments, or complexions as they were sometimes called, a common subject of speculation in his day: and that the "I" after the word "*Melancholia*" on the scroll refers to its having been intended by him as the first of a series never accomplished. This has always seemed the most probable hypothesis, and very likely no farther idea was in Dürer's mind when he conceived that grand winged woman; but a great artist's creations often transcend the bounds of his knowledge, and reveal truths to others that he himself only saw as dim images. No interpretations, fortunately, can do away with the sense of mystery that excites our minds whenever we study Dürer's art. There is no analytical process known that can give us the exact constituents of genius.

MARY M. HEATON.

THE SOCIETY OF FRENCH ARTISTS.

THIS exhibition, housed at No. 168 New Bond Street, opened on November 16. There is a great deal of talent in it: indeed the pictures which do not reach at least the level of clever and decisive sketching-work form but a small minority. The contributing artists know what they are about, and so no doubt does the Director, M. Durand-Ruel. The more salient examples belong to the landscape section: in figure-subjects there is little of leading importance, but plenty of skill.

Rent-day, by Robert-Fleury, painted as far back as 1849, comes among the foremost. This work is evidently done with a view to the manner of Rembrandt: it has much expression and no lack of character, but the colour is too hot to be agreeable. M. Legros sends three heads, each of them interesting in its way. The first is a *Portrait of T. Woolner, Esq., A.R.A.*, a good picture and recognisable likeness, but with a certain bluntness of physiognomy which looks perhaps rather Flemish than English. The hand is gloved, and poised in the waistcoat-pocket: which seems a pity, as one naturally expects, in the portrait of a sculptor, to

see his hand uncovered. The *Portrait of Mrs. . . .* (No. 68) is the least satisfactory of the three, although the quiet drab tints of colour, opposed to the full-hued pink of the flesh, are of true painter-like quality. The *Study of a Head* (No. 15) is extremely fine. It represents a dark and rather fat Spanish or French woman of some thirty-five years of age; an interesting face, with much capability of emotion. The deep-tinted but clear flesh, the neutral background, and the varying shades of black or sombre brown in dress, veil, and hair, with one gold ear-ring showing as a point of richness and relief, make up a memorable piece of pure reserved colour. The work combines the facility of a sketcher with seriousness of study, and is in both ways masterly. With this we may compare the *Study of a Head* by Ribot (No. 16); also the work of a trained and sure executant, and fairly like a Velasquez, but a dull and ugly one. The girl who sat for this portrait must surely have had scant justice done to her.

Other works which should be looked at are *The Breakfast-table*, E. Duez; *Scène de Ballet*, E. Degas, merely laid in, but with much truth of a certain kind; *Roybet's* two contributions, *The Beer-drinker*, and *The Card-players*; *The Lady in White Dress*, by Alfred Stevens, slight, but, as usual, telling; *Washing on the Seine*, Boldini, very clever in touch and general management, but somewhat raw in colour; *Scene in Tunis*, R. Le-grand, a minute piece of finished precision; *Return from the Battue*, Jules Ferry; *A Caravan on its Way to the Sea*, V. Huguier; *Sifting Wheat*, Feyen-Perrin, combining something of the style of Millet's peasant-subjects with purposely statuesque pose; and the *Mother and Child* of J. De Vriendt, one of the followers of Baron Leys.

We reserve for another article the landscapes in the Gallery, and other miscellaneous works.

W. M. ROSETTI.

GENERAL CUNNINGHAM'S DISCOVERIES AT BHARHUT.

WE called attention some time ago (ACADEMY, August 1) to the important discoveries lately made by General Cunningham, the Director of the Archaeological Survey in India. They were dwelt on by Mr. Grant Duff in his address before the Archaeological Section of the International Congress of Orientalists, and excited the keenest interest among foreign scholars who were then present. Unfortunately, no sketches or photographs of the ruins of Bharhut had been sent from India in time for the Congress. General Cunningham, however, has now returned to Bharhut (this is his own spelling of the name), and is at present engaged in taking photographic copies of all that is important among the ruins of the old Buddhist Stūpa. Some of them have been received, and convey an idea of the real state in which the sculptures and the inscriptions are found. On the pillar which contains the scene of the Jetavana garden being bought by Anāthapindaka by covering the ground with pieces of gold, we see indeed something that may be construed as representing that famous event; but it is doubtful whether, without the inscription underneath, anyone, even if he possessed the learning and sagacity of Mr. Beal, could have guessed its real meaning. The inscription, of which there is both a small photograph and a rubbing on paper, is likewise not quite clear. In the centre some of the letters are injured, and as it now stands it is difficult to discover the exact grammatical construction. It reads:—

"getavana anādha (tha) pedi ko da (?) ti ko ti sam thatena ketā (to)."

The letter read *dh* in *Anādha*, may be meant for *th*, but *pediko* cannot be made to stand for *pindaka* or *pindada*, nor can *ketā* stand for *krito*, "bought." Samthata might be the Sanskrit *samstāta*, spreading out. As the number of inscriptions seems considerable, they may in time throw light on

each other, and enable us to form a more exact idea of the Pali dialect in which they are written. At present, the interpretation must be considered as hypothetical only.

General Cunningham is fully aware how much depends on fixing a date for these ruins. The style of the architecture, the character of the sculptures, the shape of the letters, all would seem to point to an early date, to a date anterior to our era; but the less positive archaeologists are in fixing dates on such evidence, the better for the free progress of scientific enquiry. General Cunningham's chief argument in favour of ascribing the original building to the age of Asoka, is derived from an inscription engraved on one of the pillars of the East Gateway. It reads as follows:—

"Suganam rāge rāgna gāgiputasa visadevasa potasa gatiputasa agarāgasa puteva vākkhiputasa dhanabhūta kārīta toranā silākammatā ku upamāna."

Bābu Rajendra Lal Mitra, whom General Cunningham consulted, explained it:—

"In the kingdom of Sugana (Srughna) this Toran with its ornamental stone work and plinth was caused to be made by King Dhanabhūti, son of Vākhi and Agarāga, son of Gati, and grandson of Visa, son of Gāgi."

A comparison with the original shows that the translation cannot be accepted, and General Cunningham has therefore proposed the following:—

"In the kingdom of Sugana, this Toran (ornamental arch), with its carved stone work and plinth, was caused to be made by Vākhiputra's pupil, Rāga Dhanabhūti, the son of Gatiputra's pupil, Agarāga, and the grandson of Gāgiputra's pupil, Visa Deva."

General Cunningham points out that two of these names, Gatiputra and Vākhiputra had already appeared in the Bhilsa inscriptions, and he holds that Gāgiputra, Gatiputra, and Vākhiputra are the names of Buddhist teachers, and that the kings named in the inscription are their spiritual pupils. He then argues, that in the Bhilsa records the two names of Gatiputra and Vākhiputra hold the same relative position chronologically which they do in the Bharhut inscription; that Vākhiputra is said to be the pupil of Gatiputra, and that consequently Aga Rāga and Vākhiputra were fellow-pupils. He thinks it was due to this connexion, that Aga Rāga selected Vākhiputra as the teacher of his own son Dhanabhūti. Lastly, as the famous Mogaliputra was likewise a pupil of Gatiputra (see *Bhilsa Topes*, plate xxix. No. 9), and as he was seventy-two years of age at the meeting of Asoka's Synod, 242 B.C., General Cunningham concludes that his fellow-pupils Vākhiputra and Aga Rāga must have flourished towards the end of Bindusara's reign, or about 270 B.C., while Dhanabhūti, the pupil of Vākhiputra, cannot be placed later than 240 B.C.

This argument is certainly ingenious, but it rests on an explanation of the names Gāgiputra, Gatiputra, and Vākhiputra, which can hardly be accepted. The custom of taking the mother's name was common in the early ages of Buddhism. King Agātasatru is called Vaidehiputra, meaning either the son of Vaidehi, or the son of a Vaideha woman. In the genealogies of the Yagurveda the same system prevails. The name of Gāgiputra, which is mentioned there, is probably the same as the Buddhist name Gāgiputra. It would be impossible to suppose that King Agātasatru was called Vaidehiputra, because this was his teacher's name; and the same difficulty will be felt by most scholars with regard to King Dhanabhūti Vākhiputra, King Agarāga Gatiputra, and King Visadeva Gāgiputra.

Another argument in favour of the early date of the Bharhut ruins advanced by General Cunningham is of greater value. About three years ago, he says, a small hoard of silver coins was found in a field near Jwalanukhi, which comprised five coins of the native princes Amogha-bhūti, Dāra Gosha, and Vāmika, along with nearly thirty specimens of the Philopator coins of Apollodotus. There were no other coins in the hoard, and as

the coins of Apollodatus, as well as those of the native princes, were all quite fresh and new, the whole must have been buried during the reign of Apollodatus, or not later than 150 B.C. The Indian characters on the coins of the native princes have all got heads, or *mātrās*, added to them, while several of them have assumed considerable modification in their forms, more particularly the *g*, *m*, *gh*, which have become angular on the coins. But these letters are invariably round in all the Bharhut inscriptions, exactly like those of the known Asoka records. The absolute identity, therefore, of the forms of the Bharhut characters with those of the Asoka period is a very strong proof that they must belong to the same age.

With regard to King Amogha, General Cunningham adds that the name which Mr. Thomas reads *Krananda*, and which he tried to identify with *Xandrames*, is really *Kuṇḍa*. The inscription reads:—

"*Ragna Kuṇḍasa Amoghahbhuṭisa Mahārāga*,"

Kuṇḍa being the name of a people. The same custom of giving the national name prevails in the *Mādhyaṃika* coins, two specimens of which were given by Prinsep, but upside down. The legend is:—

"*Maḡhīmīkāya sibiḡannapada*, coin of the *Maḡhīmīkāya* of the county of *Sibi*."

Sibi is the scene of the *Vessantara Gāṭaka*, situated in the neighbourhood of *Chetiya*, and if *Chetiya* was *Vidisa* or *Bhilsa*, *Sibi* would be *Ujavi* or *Chitor*, the very place where Prinsep's two coins were found, and where General Cunningham discovered eight more of the same type. According to him, *Sibi* would be the true original of *Siwālikā*, which among the early Mohammedans included all the hilly country to the south of *Delhi*. Equally important are numerous coins (several hundreds) of the *Mālavāna*, another people mentioned in the *Mahābhārata*. Their legends are written in various characters from the time of *Asoka* to the age of the *Guptas*, or perhaps even later. These ethnic coins, General Cunningham remarks, and especially those of the *Maḡhīmīkāya*, are the highest triumph of Indian numismatics.

MAX MÜLLER.

NOTES AND NEWS.

A PORTRAIT of the late *Owen Jones* has been exhibited for a few days at the South Kensington Museum, seemingly intended to be executed in mosaic, similarly to those already placed in the South Court of that building. The picture gives a profile likeness of the artist, satisfactorily correct, standing in an easy position and bearing under his arm a large portfolio. To avoid the awkward outlines of modern costume, a travelling plaid is thrown round the figure, and the whole has a sober tone which contrasts powerfully with the gold background. This may be intentional, as light colours do not suit in proximity with gold—witness the *St. George of England* in the central lobby of the Houses of Parliament. The artist is *Mr. F. W. Moody*, already well known as a designer of much decorative work in the Museum, though this is, if we mistake not, the first portrait we have seen from his hands. The mosaic, surrounded by a well-designed oriental enrichment, will be appropriately placed in the Indian Court, the ceiling of which was designed by *Mr. Owen Jones*.

AMONG the most recent additions to the collection of Greek and Roman antiquities in the British Museum are five Athenian *lekythi*, and a small series of terra-cotta statuettes from *Tanagra*, which latter are not only remarkable among their kind for beauty, but are also in a state of almost perfect preservation. The *lekythi* are of the usual form and polychrome design, the subject of which, to be in keeping with the destination of these vases—they were made to be placed in tombs—is of a sepulchral nature. On one of them

is to be seen *Charon* approaching in his boat to where a lady stands beside a tomb. On two of them the delicacy of the drawing, and the refinement displayed in the bearing and the proportions of the figures and in the composition of the groups, are in a high degree worthy of notice. From *Aristophanes* (*Eccles.* 906) it seems to have been a special branch of art in Athens to paint these *lekythi* (ὡς τοῖς νεκροῖσι ζωγραφεῖ τὰς λεκυθοὺς). For the colours employed in sepulchral architecture at least, and for the colours of the dresses worn in Athens, these *lekythi* furnish valuable evidence. The Museum collection of them is now very rich. The newly-acquired specimens are for the moment to be seen in the Bronze Room.

THE colossal statue of *Adonis*, which was said to have been lately discovered on a farm near *Mount Onandaga*, in America, and which Professor *Schlottmann*, at the Congress of Philologists in *Innsbruck*, declared to be of Phœnician origin, has been proved to be a forgery. As the statue is ten feet long, and made of alabaster, the expense of the forgery must have been considerable.

THE Exhibition of the Union Centrale in the *Champs Elysées* closes on the 30th of this month.

THE Greek Government has just arrested at Athens *M. Xacousti*, a dealer in antiquities, who had carried off to *Tanagra* some very ancient statues. The police discovered in a back room of his house an artist occupied in restoring all the statues, with a view to selling them to the European museums. The dealer, artist, and the hundred and twenty statues are all in the hands of the police.

MESSRS. CHRISTIE, MANSON AND WOODS began their sales this week. On the 10th and 11th were sold china and tapestries; the former a miscellaneous collection, consisting mostly of English:—Lot 279, A brown stoneware jug, mounted in silver-gilt, chased and engraved, with the hall mark, date 1590, sold for 53 guineas. Of the old Bow:—Lot 223, Four groups representing the Elements, 51*l.* 9*s.*; Lot 224, A pair of fine figures of Gardeners, 50*l.*; and Lot 286, A pair, lady and gentleman with bird and cage, 26 guineas. The Chelsea figures fetched but moderate prices:—Lot 195, A pair of two-light candlesticks with seated figures in *boquets*, 23 guineas; Lot 234, Justice, 10 guineas; Lot 237, A centre-piece formed of four kneeling figures of negroes, holding shell-shaped fruit dishes, 45*l.*; Lot 287, A pair of candlesticks, may blossoms and poultry, 15 guineas; Lot 288, Figure of *Britannia*, 14 guineas; Lot 290, A pair of Chelsea Derby rustic figures, boy and girl, 20 guineas. The tapestry, of which there were five pieces, was remarkable, as being of silk and the work of Polish looms, executed before the partition of Poland. The colours were pale, and had more the appearance of paintings in *gouache*, the drawing of the figures indifferent. The prices it fetched were low. Lot 320, A river scene with peasants, measuring 18*½* by 16 feet, and signed "F. Glaize à Varsovie," sold for 30 guineas, and its companion, Lot 321, for the same price. The largest piece, Lot 324, 37 by 16 feet, with hunting subject, inscribed with the same initials as above, fetched 50 guineas.

THE *Istituto di Corrispondenza Archeologica* of Rome continues its valuable reports on the most important of the excavations going on among the ancient sites of Italy, the October number of the *Bullettino* being devoted to excavations at *Chiusi*, *Volterra*, *Corneto*, *Capua* and *Pompei*. At *Chiusi* a tomb has been laid bare which from the nature of its wall paintings seems to date from an exceedingly early period of Etruscan art. As on the earliest so-called Phœnician or Græco-Phœnician vases, the design of these paintings consists of winged animals—not such as naturally have wings—but winged lions and panthers, with the addition of fabulous gryphons and sphinxes. The colours are black and red, the outline being

first scratched in. At *Volterra*, on the other hand, the discoveries here reported on consist of Etruscan objects dating from the later Roman period, such, for example, as terra-cotta urns with reliefs representing scenes from the Greek mythology. About a mile and a half from *Corneto* on the way to *Viterbo* has been found a tomb cut in the rock—its entrance facing the south—with two compartments, one larger than the other. There is no evidence of there having been more than one interment, and yet the objects found in this tomb range themselves into two distinct classes as regards style of work. Both classes belong to early times, the older of the two presenting a distinct resemblance to what is frequently called the archaic Indo-European art or workmanship. Another tomb opened near the same place yielded only some fragments of archaic pottery. Beside the viaduct on the way from *Capua* to *St. Maria*, *Signor Doria* has come upon two graves containing a series of vases and objects in bronze, both of Greek origin and of a style which, though archaic, still borders on the best period of Greek art. These objects will form a contrast to the many precious and comparatively perfect specimens of Greek work which *Capua* had before yielded.

M. F. LENORMANT gives, in the *Revue Archéologique* for October, an engraving and a short description of the statue of *Antinous*, found in the course of his excavations at *Eleusis* in 1860. He regards it, apparently with the consent of those who have seen it, as a work of the time of *Hadrian*. The peculiarity of the statue lies in the figure of an *omphalos* which rises from the base at the feet of *Antinous*. The presence of the *omphalos* of *Apollo* at *Delphi* at the feet of a god who was only a sort of *Dionysos*, is explained by *M. Lenormant* by a reference to the statement that *Dionysos Zagreus* met his death at that *omphalos*. If he is right so far, he is doubtless also right when he adds that the *omphalos* may thus have recalled the death of *Antinous*.

IN the same number of the *Revue* (p. 253-9) *Count Conestable* gives what was promised in a previous number, viz., some results of a general character obtained in his examination of a large series of Etruscan tombs, with a view to the question of cremation *versus* inhumation. The latter process, it seems, was that favoured by the Etruscans proper during their national independence. Under Roman dominion they appear to have resorted mostly to cremation. But *Etruria* before the advent of the Etruscans had been occupied by a primitive Italian race living, to judge from its tombs, in the so-called Bronze Age. With this race cremation was the rule, but their choice of this process is less likely to have been dictated by sanitary motives, as at present, than by the same feelings which led them, like other primitive peoples, to take delight in human sacrifice.

THE amount realised by the *Paul Baudry* exhibition (48,262 francs) has, after deducting the necessary expenses, been distributed among various charitable and artistic institutions, 2,000 francs in particular having been sent to the poor of *Roche-sur-Yon*, the birthplace of the popular artist.

THE monument to *Théophile Gautier*, which is being prepared by *M. Drevet*, is spoken of as being a very fine work. The design, however, can scarcely be said to have the merit of originality. The pedestal is formed of a block of marble sent by Belgium. On the top of this rests the usual monumental sarcophagus ornamented with crowns of immortelles, a lyre, and other emblems of poetry and fame. On the sarcophagus is seated the Muse of Poetry leaning on a bronze medallion likeness of the poet. The monument will be inaugurated, it is said, at the beginning of next year.

THE heirs of *Count Vettor-Pisani-Zusto* have presented to the city of *Venice* a fine group by

Canova representing Daedalus and Icarus, and an agate toilet service that formerly belonged to the celebrated Catarina Cornaro, queen of Cyprus.

A PANEL painting representing the Adoration of the Shepherds, signed with the initials H. H. and dated 1511, has lately been discovered by Dr. Eitelberger, director of the Vienna Gallery, in the convent of St. Paul, in the Leventhal, Carinthia. The presumption of course is that it was painted by Hans Holbein. The painting was formerly in the St. Blasien Convent in the Black Forest.

IN the newly opened Italian galleries of the Louvre will be found five paintings that have never before been exhibited to the public. One of these is by Paolo Veronese. It originally formed part of the decorations of the Ducal Palace at Venice, but was acquired by Napoleon I., who placed it in the Queen's antechamber at Versailles. It represents St. Mark crowning the theological virtues.

WE learn from the *Builder* that the new block of buildings at the north-east side of the National Gallery is now nearly finished. The rooms on the ground floor will be devoted to the use of the students, and one part will be used as offices; but the large new galleries which form the upper portion of the building are to be added to the present building and appropriated entirely to the exhibition of works of art. These new galleries are connected with those already existing by means of an entrance leading into a large octagonal hall forty-three feet in diameter, covered with a dome of iron and glass. Four vestibules open out of this hall, the approaches to which are richly ornamented by double columns of green Genoa marble. The new galleries, three in number, extend from the vestibules along the north, north-east, and east sides of the building. They are all lofty, and the largest gallery has a fine groined ceiling. It is 120 feet long by 40 wide, and by its lighting and general arrangements seems well adapted for purposes of exhibition. Every precaution, we are told, has been taken against fire, and iron has been used as much as possible in the construction of the roofs, but we regret to say the flooring is of wood. It is expected that the new galleries will be ready early next year, and it is proposed that they shall contain not only paintings, but sculpture, and other works of art. The vestibules especially will be devoted to works of plastic art. This new block, it must be remembered, is only a small portion of Mr. Barry's design for the rebuilding of our National Gallery. The carrying out of his proposed plans would involve the entire rebuilding of the frontage in Trafalgar Square, as well as a new elevation to St. Martin's Lane, and a great extension of the building westward. There seems, however, no present intention of continuing the work of reconstruction any further.

M. AILLAUD, director of the Government manufactory of tapestry at Beauvais, has just died. When the Prussians occupied the town, they took possession of the fine collection of old tapestries which forms the treasure of the manufactory, and sent it off to Germany. M. Aillaud, at the peril of his life, succeeded in procuring their restoration.

THE great staircase of the Palais Royal, which had been injured by the fire of the Commune, is now completely restored, and was inaugurated on the 5th for the ceremony of reopening the Cour de Cassation, who used it on their departure to and return from the Palais de Justice. The iron work of this staircase, belonging to the eighteenth century, is admirable, and its beauty has been hitherto in great part concealed by a thick coat of paint. Several workmen have been employed for a whole year in cleaning and restoring the iron work and regilding the bronzes which decorate it; and this fine work may now rival the two magnificent gates of the Louvre, which form the entrances, one to the Gallery of Apollo, and the other to the collection of ancient bronzes.

THE STAGE.

THE DRAMA IN NEW YORK.

New York: October 23, 1874.

THANKS to Charlotte Cushman, who has begun at Booth's Theatre a brief engagement, in which she bids farewell to the profession she has followed with distinction for forty years, and likewise to Miss Adelaide Neilson, who is presenting Beatrice and Juliet at the Lyceum, Shakspeare this week divides with Octave Feuillet the attention of the public. In a professional sense the two ladies mentioned have little in common, but I resist the temptation to suggest contrasts which is held out by their simultaneous appearance on the New York stage. It is enough to say that the mild excitement stirred by the one is as a ripple on the surface of society to the deep ground swell of interest which has been raised by the prospect of the other's retirement. You may here and there meet a person who will tell you Edwin Forrest was a ranter, and not a few who regard Edwin Booth as an overrated man, but as to Miss Cushman there seems to be but one opinion. Forrest, indeed, in his blunt way and peculiar phraseology, said once that the lady was "marked and quoted by the hand of God to play but three characters—Goneril, Meg Merrilees, and Nancy Sykes;" but Forrest is dead, and if any survive that share his opinion, they are dumb. There were candour and conscientiousness, if nothing else, in the mad tragedian's criticism: Meg Merrilees is beyond question Miss Cushman's best realisation, and she has done well to select it as one of the three characters in which she is to make her last appearances in public. Whatever mannerisms Miss Cushman is possessed of are to be charged, one and all, to her action. There is nothing to improve in her noble elocution, on which the ear hangs untiringly, marking that not a syllable dies on the air without contributing its part to the harmony of sound; but the eye does not share the delight of the sister sense. Like "a queen and daughter to a king," Miss Cushman bears herself with dignity, and if grace form no part of that dignity, it is very easy to become reconciled to such a want in a woman of her weight. Her one chief defect is now, and always has been, a certain lack of repose, but for this there would be little room for improvement in her method; for even when, with her, the action suits the word, the word would often, it must be admitted, be still better suited by no action whatever.

Miss Neilson has been representing Beatrice—an effort which will not add to the lady's reputation here; but which has been, on the contrary, so great a disappointment to discerning people, that the managers of the Lyceum have done right in withdrawing *Much Ado about Nothing* and substituting *Romeo and Juliet*. Miss Neilson has not yet acquired the art of word-fencing, of which Beatrice's representative should be a mistress. From her lips repartee comes like the downward stroke of a broadsword, not like the wrist-play of a rapier thrust. She dulls the edge of the sarcasm, obscures the sparkle of the wit, and replaces the piquant vivacity of Beatrice by an abundance, and to spare, of animal spirits. In *Romeo and Juliet* Miss Neilson appears to much better advantage; but even when personating Juliet—which she has laboured over, it will be confessed, to some purpose—it seems as difficult for her to rid herself even for one moment of her identity, as it is for her audience to rid themselves of the idea that what they witness is a very transparent piece of simulation. To be totally unconscious of Miss Neilson while Miss Neilson is on the stage is not possible. Her beauty is the admiration of men, and her costumes the wonder of women; and if her stage appearances are not impressive, they are on the whole pleasing—and the large majority of people prefer rather to be pleased than to be impressed.

ROBERT SOMERS.

A SUDDEN barrenness has come over the theatrical world, so that theatrical people might imagine themselves to be within a fortnight of Christmas—the dead fortnight during which everything is prepared and nothing produced. There has been no new piece this week, and for to-night nothing more important is announced than the opening of the Opera Comique under the control of Miss Amy Sheridan. Mr. Burnand's burlesque—a new version of *Trion*—of which we have spoken before, will then be brought out; Messrs. Stoyte, Barker and Gaston Murray, Miss Pattie Laverne and Miss Eleanor Bufton being the principal people engaged.

OPERA BOUFFE continues to be everywhere. Its reign is despotic and will probably be brief. The Criterion Theatre is the last territory it has conquered, and there on this day week the *Près Saint Gervais* will be produced. There will be Lecocq's music to an English adaptation of Sardou's little story, now much expanded by himself for performance in Paris. The excellent singer, Miss Pauline Rita, is among the artists engaged.

MR. PHELPS is to return to the Gaiety Theatre at Christmas. It has been announced that the *Merry Wives of Windsor* will be played on the occasion of his return, Mr. Phelps enacting Sir John Falstaff—one of the pleasantest things we may now look forward to, if he be but strongly supported.

NOTHING is sacred for a comic actor: not even *Hamlet*. Poole's travesty of the same was played last Saturday for the benefit of Mr. Odell, whom some of us remember at the Strand and elsewhere. Mr. Odell himself appeared as the Prince of Denmark, and it was his effort to parody the performance of Mr. Irving. Though on the whole Mr. Odell was feeble, it gratified the audience to see the dead Polonius carried off, as Matthias in *The Bells* bore off the Polish Jew; while Miss Rachel Sanger was found amusing as Ophelia, and Mr. Brough very funny as the King. A scene from *Two Roses*, with the Vaudeville company, formed part of the day's entertainment.

A BRILLIANT writer, who does so much that he prefers frequently to have recourse to a pseudonym, to relieve him of superfluous honour, is now busy, we hear, upon a piece for the Court Theatre.

MR. CLAYTON, the actor—brother of a well-known painter—is engaged in travelling and playing with Miss Bateman in the provinces.

EVEN in the country it is easy, apparently, to find audiences for the *School for Scandal*. At Bristol, last week, it was acted at both the theatres. At one house Mr. Coleman and Miss Helen Barry performed the parts of Sir Peter and Lady Teazle, while at the other these parts were performed by Mr. J. Clarke and Miss Furtado. Mr. Clarke's effort was new, and not amazingly successful. Miss Furtado has represented Lady Teazle a hundred times, and looks the character excellently.

Now that the *Veuve*, by Meilhac and Halévy, is played at the Théâtre du Gymnase, *La Princesse Georges* is performed no longer, and Mlle. Tallandiera, the *débutante*, is accordingly no more to be seen. She will of course re-appear, for though the effect produced at her *début* was not quite such as had been anticipated, judges of the art of acting, like M. Regnier and M. Dumas, can hardly have been mistaken when they predicted great things for her. A correspondent who saw her during one of her very few performances, has written to us what was his impression—an impression of power, he says, as yet untamed, and perhaps untameable. For Mlle. Tallandiera, though but a beginner in art, is by no means young. "It produces," writes our correspondent, "a strange effect to see such weariness with such rawness, such force with such inexperience. She is more weary than Desclée, and, at moments, more terrible. *Dalilah*—the one drama in which Octave Feuillet has allowed himself to be repulsive—is the piece in which she should play."

M. HENRI DE LAPOMMERAYE's first spoken dramatic criticism, delivered a few days ago in the lecture-room on the Boulevard des Capucines, was decidedly successful. A "first night" at the theatre could hardly have attracted a better audience—poets, critics, actors, publishers, and women of the world "assisted" at what we were about to call the "representation," for M. de Lapommeraye did more than criticise—he read certain scenes: notably one scene from *Le Demi Monde*, which produced, they say, an excellent effect.

WITH *Le Tour du Monde en Quatre-vingt Jours*, the Théâtre de la Porte Saint Martin has made sure of a popular success which will suffice for the winter. The adventures of an Englishman, when an Englishman is eccentric, as in the eyes of the Paris population he is pretty sure to be, are always amusing, and specially amusing when it falls to the lot of an entertaining Frenchman, like M. Jules Verne, to take him round the world in eighty days. Some dramatic element, however, was wanting to the work, already easily fitted to a spectacular entertainment, and this has been supplied by the accomplished M. Dennery, one of the authors of *Les Deux Orphelines*, who has here worked in a lighter mood. Dumaine, Lacressonnière, Vannoy and Alexandre appear in the piece, but their parts are hardly such as can add to their reputation, though the piece gains in effectiveness by their presence.

Giroflé Girofla, given in Paris at the Renaissance Theatre, has in the opinion of one at least of its critics the disadvantage of employing those who are better, or would be better, in comedy than in opera bouffe. Mdlle. Granier, a delicate young actress, with a frail voice and an excellent talent, will probably suffer by playing every night such a long and difficult part as that of the heroine. Mdlle. Alphonsine is properly funny in the piece, and so is Monsieur Baron.

APPROPOS of the recent revival of an early piece by Auguste Vacquerel, who has since done better work, M. Caraguel, writing in the *Débat*, recalls the day of its first production. When it was over—and it had been listened to with impatience—Frederick Lemaître, who played in it, stepped forward and said to the audience that had already hissed it, "Ladies and gentlemen, the author of this piece wished the piece played, and I promised to act the principal part. Now that I have fulfilled my duty to the best of my ability, I may confess my agreement with your verdict. You have pronounced the piece bad. Ladies and gentlemen, in my opinion it is detestable. *Vive la République!*" And he withdrew.

MUSIC.

CRYSTAL PALACE CONCERTS.

THE musical event of the week has undoubtedly been the production at Sydenham for the first time in this country of a symphony by one of the most prominent living German composers—Joachim Raff. Though well known and highly esteemed on the continent, he has still, like many other of his countrymen, to make his way here. True, a few of his works have from time to time been heard in England. Dr. Hans von Bülow introduced his pianoforte concerto at the first of last season's concerts of the Wagner Society; Mr. Charles Hallé has given a part (if not the whole) of his great symphony "Im Walde" at his concerts in Manchester, and has also played some of his chamber compositions at his recitals; but until last Saturday not one of his symphonies had been heard in London. And yet Raff is undoubtedly the most distinguished symphony writer now living. He has produced in all six compositions of this class, the more recent of which we propose shortly to review in these pages. For the present we must confine ourselves to the fifth, that entitled "Lenore," which was the one given last week.

The subject of the present work is taken from

Bürger's well-known ballad of the same name. For those of our readers who may be unacquainted with it, it may be well to say that it tells how a young maiden, Lenore, whose lover had gone to the wars and failed to return, curses her fate, and longs for death. That night her lover comes to her chamber telling her to mount his charger and ride behind him a hundred leagues to their wedding feast. She obeys, and away they go, over hill and dale. As they fly along the ravens flap their wings, the frogs croak, they pass a funeral procession, they see a group of ghosts dancing round the corpse of a felon hanging on a gibbet, and everything, as they pass, joins them in their flight. At daybreak they reach a churchyard, and by an open grave Lenore finds herself clasping a corpse, and expires at the side of her lover. Such a ghastly programme would be obviously unsuited for the subject-matter of an entire symphony; and Herr Raff has therefore only treated it in the finale, to which the first three movements may be considered preliminary.

The symphony is divided into three parts: the first, entitled "Liebesglück," comprises the opening allegro, and the slow movement (Andante quasi larghetto). These two numbers evidently depict various phases of a happy love. In the first allegro we have the gushing exuberance of passion. Here all is warmth and luxuriance. The profusion of melody, the richness and variety of harmony, and the glow of the orchestral colouring, combine to form a tone-picture as interesting musically as it is true in expression. To this succeeds a tranquil love-scene, which is certainly somewhat long, but, as the length arises from the wealth of ideas, not wearisome. Especially remarkable in this movement are the passionate episode in G sharp minor (p. 78 of the score) and the exquisite close, with the long sustained harmonies for the strings, over which the flute and clarinet hover, one might almost say lovingly, while the sullen pulsation of the drum seems to give a warning of coming ill. The third movement of the symphony, inscribed "Trennung," is a grand march, instead of the customary scherzo. The change is here fully warranted by the scheme of the work. Lenore's lover is to depart for the field, and the march itself is interrupted by an *agitato* movement taking the place of the usual trio, in which the farewell of the fond pair is evidently depicted. The subject of the march itself is slightly commonplace, but it is treated with such masterly skill as to afford a striking example of what can be done by a thoroughly competent musician with not over-promising materials. The orchestration is especially fine, sonorous and brilliant in the highest degree, and yet never too noisy or overloaded. At the end of the movement the music dies away into silence, as the last footsteps of the departing army are wafted back by the wind.

The finale (the fourth movement, and third section of the work) is entitled "Wiedervereinigung im Tode," and deals with Bürger's ballad above mentioned. This, we cannot but think, is far inferior to the rest of the work. An enquiry into the reason of this opens up the whole wide question of "programme-music," into which it is impossible here to enter. Suffice it to say that while the preceding portions of the symphony have all depicted what is fairly within the province of music, it seems to us that here more is attempted than from the very nature of the art can possibly be carried out. The ride of the ghostly horseman, with all its concomitant horrors, is not a suitable subject for musical illustration. It is impossible to be insensible to the wild strange power which pervades this very remarkable finale; some of the orchestral effects, indeed, are marvellous; but the impression produced by the whole movement is not, for the reasons above given, satisfactory. The work as a whole is, nevertheless, a masterpiece; and its performance will doubtless cause the introduction of other of Raff's symphonies to our concert audiences. The

execution of the symphony, which makes no small demands on all the players, was a magnificent triumph for Mr. Manns and his fine band. It may safely be asserted that never has a finer first performance of a difficult work been given; while the enthusiastic applause with which each movement was greeted showed that it was fully appreciated by the audience. Seldom, if ever, has a new symphony received such an ovation as that bestowed on "Lenore."

A very few lines must suffice for the remainder of the concert. The overtures were Beethoven's *Coriolan* and Boieldieu's *Les Deux Nuits*—the latter a pleasing though not great work, which was given on this occasion for the first time at these concerts. The instrumental soloist was Mr. Walter Bache, who made his first appearance at these concerts in Liszt's arrangement for piano and orchestra of Weber's Polacca in E. Mr. Bache's name will be familiar to readers of the ACADEMY; it will therefore be needless to say more than that he played in his usual finished and thoroughly artistic style. The vocalists were Madame Otto-Alvsleben and Mr. Santley, both of whom are too well known to require any praise here. To-day Liszt's Second Pianoforte Concerto is to be played, for the first time in England, by Mr. Dannreuther. EBENEZER PROUT.

THE second of the Monday Popular Concerts, which took place last Monday, was fully as interesting as the first. Signor Piatti, who was sufficiently recovered from his recent indisposition to be able to appear, received, it need hardly be said, a most hearty welcome from the audience. The novelty of the evening was Spohr's trio in A minor, Op. 124—the third of a series of five which this composer has written, and which had not been given previously at these concerts. It is a pleasing rather than a very great work, marked by all Spohr's peculiarities and even mannerisms, but full of graceful melody, and well worthy of occasional performance. It was admirably played by Dr. Bülow and Messrs. Straus and Piatti. The great pianist chose for his solo Handel's Suite in D minor, which he gave with such effect as to obtain a double recall. He also joined Signor Piatti in Beethoven's Sonata in F, Op. 5, No. 1. The quartett of the evening, admirably given by Messrs. Straus, Ries, Zerbini, and Piatti, was Schumann's No. 1 in A minor, one of his most original and interesting compositions. The vocalist was Mdlle. Nita Gaetano, and the accompanist Mr. Zerbini.

THE programmes of the past week of the Albert Hall Concerts have fully sustained the promise of their opening. Among the most important works given on Tuesday (the English Night) were Bennett's *Naiades* overture, Mr. G. A. Macfarren's new "Festival" overture, Sir Julius Benedict's symphony in G minor, Mendelssohn's concerto for piano in the same key (played by Mr. Franklin Taylor), and Mr. H. Gadsby's clever overture to *Andromeda*. Wednesday was a "Beethoven" night, the works being entirely those of his earlier period. These will be, we presume, followed by illustrations of his later periods; so that these concerts will have a really educational aim. Among the works in Wednesday's programme were the symphony in D, the concerto in C minor (Miss Agnes Zimmermann), and the overture and march from *Prometheus*. On Thursday the *Hymn of Praise* and Rossini's *Stabat Mater* were given; and at the "Wagner Night" on Friday, in addition to a selection from *Lohengrin* and Wagner's "Huldigungsmarsch," Liszt's First Concerto and his Hungarian Fantasia were announced to be played by Dr. Bülow. The programmes of the "Ballad Night," last Monday, and of the "Popular Night," this evening, are, in a lighter style, quite as good as those which we have specified.

THE ninth season of Mr. Henry Holmes's "Musical Evenings" opened on Wednesday last at St. George's Hall. The opening piece was Schu-

bert's great quartett in G, Op. 161. This truly magnificent work is so seldom heard in public, that Mr. Holmes deserves the warmest thanks of all musicians for bringing it forward. Though very long (occupying even with the omission of most of the repeats three-quarters of an hour) its beauties are so many and so great, that it was listened to by the audience without a sign of weariness. The performance by Messrs. Holmes, Betjemann, Amor, and Pezze, was in all respects worthy of the music. Finer quartett playing is indeed seldom if ever to be heard. The other principal items of the evening were Beethoven's quartett (No. 4) in C minor; Mr. Walter Macfarren's interesting and well-written sonata for piano and violoncello, well played by the composer and Signor Pezze; a violin solo composed and performed by Mr. Henry Holmes; and Mendelssohn's "Variations Sérieuses," played by Mr. Walter Macfarren. The vocalist was Miss Emma Beasley. Such excellent musical entertainments as Mr. Holmes's deserve all possible encouragement.

MR. WILLIAM REA, of Newcastle, has lately brought to a successful conclusion the ninth of his annual series of orchestral concerts in that town. An excellent band of twenty-six stringed, and twenty wind instruments, including many well-known London professionals, and led by Mr. J. T. Carrodus, was engaged. How much good Mr. Rea is doing in the north by such excellent concerts may be seen when it is said that, in addition to miscellaneous vocal and instrumental music, overtures, marches, &c., eight complete symphonies and six concertos were given during the series. The following larger works were also performed:—Handel's *Messiah* and *Judas Macabæus*; Mendelssohn's *Elijah*, *Athalie*, and the finale to *Loreley*; Schumann's *Paradise and the Peri*; and Randegger's *Fridolin*. We are happy to add, on the authority of competent judges who were present, that the execution was worthy of the music.

MILLE MARIE KREBS will make her first appearance at the Monday Popular Concerts on January 11.

A TALENTED young singer, Fräulein Louise Troch, the daughter of the well-known Capellmeister and composer, Heinrich Troch, of Vienna, will appear in June and July next at the London Opera—the *Neue Freie Presse* does not state which.

ANTON RUBINSTEIN is at present in Paris, for the purpose of arranging with M. Halanzier for the production of his new opera of *Nero* as one of the first novelties of the New Opera.

THE death is announced of Herr Albert Wagner, the late stage manager of the Royal Opera, who died suddenly on the 31st ult. in Berlin, in his seventy-fifth year. Albert Wagner was the eldest brother of Richard Wagner, and the father of Frau Jachmann-Wagner, the celebrated tragic actress and prima donna. He was born at Leipzig, and educated as a dramatic singer, in which quality he made his first appearance on the stage of his native town as Joseph in Méhul's opera of that name.

THE prize lately offered by the "Tonkünstlerverein" of Cologne for the best pianoforte quintett has been awarded to Herr J. Schapler, of Thorn; and Herr W. J. Heller, of Hermannstadt, has received honorary mention as the second best.

MUSICIANS and painters are combining to give the Viennese public some really enjoyable evenings this winter. On December 1 there will commence at the "Musikverein" a series of "Musical and Picturesque Performances." Magnificent transparent pictures, designed and executed by some of our greatest painters (Hans Makart among them), will illustrate the different phases of

the Passion history, whilst—mysteriously and invisibly, as Richard Wagner dreams it—chorus and orchestra will, with their lovely strains, reproduce the "Stimmung" of the picture. Among the works which will be thus illustrated there are to be oratorios by Handel, Mendelssohn, Bach, and others, and a new Christmas cantata by a young Russian lady composer, Mdlle. Adajewsky; also excerpts from Liszt's *Christus*. Director Hellmesberger will be the musical conductor. A similar enterprise in Berlin has been very successful these last few years, and so it is to be hoped that the undertaking in Vienna, which is to be on a grander and more artistic scale, will also command success.

MDME. EICHBERG, of Berlin, intends shortly to give a performance of Wagner's *Rheingold* in that city, with pianoforte accompaniment (!) and the best available vocalists.

It is now stated that the Abbé Liszt will not, as previously announced (see ACADEMY for October 31), take part in the projected Wagner concerts at Vienna, as he intends to go to Pesh for two months, and to spend the rest of the winter at Weimar.

THE Imperial Russian Musical Society in St. Petersburg announces a series of five concerts during the coming winter, at which the following works are to be performed—a new symphony by Anton Rubinstein, and the same composer's oratorio *Das verlorene Paradies*; "Demon," a symphonic poem by Naprawnik; a Fantasia on Shakespeare's *Tempest* by Tschaiakowsky; Beethoven's Pastoral Symphony, and Schumann's Symphony in B flat, Mendelssohn's *Midsummer Night's Dream* music, and Mozart's "Requiem."

THE *Leeds Weekly Express* of last Saturday contains some interesting details as to the attendances, receipts, &c., at the recent festival. It appears that by far the largest audience was drawn together by Schumann's *Paradise and the Peri*, while *St. Paul* proved the least attractive performance. Though the accounts are not yet finally made up, it is known that there will be a net balance of at least 1,000*l.* It has been decided to give one-half of the profits to the Leeds Infirmary, one-fourth to the Dispensary, one-eighth to the Hospital for Women and Children, and one-eighth to the House of Recovery.

M. REYER, in the *Débats* of the 15th inst., speaks very favourably of a young singer, Mdlle. Henriette Lory, who has just made her *début* at the Paris Opera as Zerlina in *Don Giovanni*.

THE new opera, *The Taming of the Shrew*, by Hermann Götz, is now in rehearsal at the Hofopern Theatre at Vienna.

AUBER's opera *Le Premier Jour de Bonheur* was produced at the Vienna Komische Oper on the 7th of this month, and had a sensational success. Herr Erl and Fräulein Tremel and Jäger had the principal parts.

RUBINSTEIN's opera *Die Maccabæer* will be produced next February in Berlin. The composer, who is at present in Paris, will give two great concerts in Vienna on his return from Berlin, where he will rehearse and conduct his own opera. His last opera, *Nero*, will be produced next season at Paris.

JOHANN STRAUSS has, according to the *Neue Freie Presse*, entered into negotiations with a great Parisian publisher to compose for him an opera to a French libretto. Two principal theatres of Paris are in competition for the right of producing it.

WEBER's *Euryanthe* and Spohr's *Jessonda* have, according to private letters from Wiesbaden, been very successfully revived at the Hoftheater, with Fräulein Gungl in the principal parts. Spohr's *Jessonda*, we believe, has for many years not been on the *répertoire* of any opera-stage.

POSTSCRIPT.

MR. AND MRS. KENDAL are this week at Birmingham, playing in *The Hunchback* and in *Romeo and Juliet*, and in the tragedy of Shakspeare they have been greatly successful.

At a meeting of the Numismatic Society, held on November 19, the President (Mr. Evans) exhibited an angel of Henry VII. with the name Henricus in full and what appears to be the numeral 7, an angel of Mary with Roman letters, and another of the first coinage of Elizabeth.

A paper was read on Jewish Numismatics by Mr. Madden, designed to discuss the most important theories on this subject which have been advanced since the publication of Mr. Madden's book on Jewish coins in 1864. The most interesting of these is the latest theory of M. de Saulcy as set forth in his *Etudes Chronologiques des Temps d'Esdras et de Néhémie*, wherein he attributes the shekels formerly ascribed by him to the high-priest Jaddua, and by Madden to the time of the Maccabees, to the time of the prophet Ezra, an attribution in which he has been followed by Lenormant in his work on the Phœnician alphabet.

THE *Nürnberg Stadtzeitung* publishes a letter from Dr. Essenwein, of the Germanische Museum, in which he proposes that a picture gallery shall be established in Nürnberg worthy of the size and historical importance of the town. We do not wonder that Nürnberg feels somewhat ashamed of the poor display she now makes in pictorial art, considering the great works that her masters executed of old, but although she has been robbed of most of the painted treasures bequeathed by her children, or worse still, has been obliged to yield them with forced grace to greedy emperors and electors, a few still remain that would have great interest in any collection. The Nürnberg magistrates received Dr. Essenwein's proposition most favourably, and his plan will no doubt soon be carried out. The Germanic Museum offers a suitable locality for such a gallery; in fact, it will be merely an extension, so far as we can understand, of that valuable institution, which already possesses in Dürer's noble portrait of Holzscherer the nucleus of a worthy collection of the works of national masters. The very poor collection in the Rathhaus, and the painful productions of early German art in the Moritz-Capelle are at present all that Nürnberg can boast of in the way of picture galleries.

LITERATURE.

The Life of Henry John Temple, Viscount Palmerston; with Selections from his Diaries and Correspondence. By the Right Hon. Sir Henry Lytton Bulwer, G.C.B., M.P. (afterwards Lord Dalling). In Three Volumes. Vols. I., II., 1870. Vol. III., 1874. (London: R. Bentley & Son.)

THE first two volumes of this biography were published four years ago, and the third and concluding one in September last. They bring down the life of Lord Palmerston to the year 1848; and since, Lord Dalling being now dead, there seems very little prospect of the work being proceeded with at present, and since the earlier part of it has never been reviewed in these columns, we propose on the present occasion to survey it as a whole. As, however, its more details have to some extent lost their novelty, we shall rather dwell at present on such parts of it as illustrate generally Lord Palmerston's character, policy, and position in the scale of parties, than on the merits of Lord Dalling's own performance.

When Lord Palmerston first entered public life, that division of the main stream of Toryism into two channels which was destined to produce such important consequences in the future had just commenced. He accepted a junior lordship of the Admiralty from the Duke of Portland. And the discordant elements which the Premier tried vainly to control very soon manifested their force in the quarrel between Castlereagh and Canning. Both these statesmen, however unfriendly to each other, belonged to the same party, that is, the Pittite party, or the more Liberal section of the Tories. And their secession from the Government on the formation of Perceval's Ministry gave that official ascendancy to the less Liberal or Addingtonian section which it retained almost to the death of Lord Liverpool.

The very friendly tone in which Lord Palmerston speaks of Mr. Perceval, who offered him at the age of twenty-five so important a post as that of Chancellor of the Exchequer, may be due either to gratitude for the Minister's kindness, or to sympathy with the Minister's opinions. But there is nothing else to tell us whether he joined the administration as a disciple of Mr. Pitt or Mr. Addington. It may be presumed, however, that as far as he thought at all about it, he at this time inclined rather to the latter. It was the more numerous and the more fashionable party of the two. It was the party at once of the country and of the Court, of the squires and the King; the

Pitt party being composed of a select minority who represented for the most part the intellect and statesmanship of the party, but not the prevailing prejudices which inspired both the sovereign and the people. As time went on and Lord Palmerston grew older: as peace succeeded to war, and domestic agitation to peace: it is difficult to believe that so powerful a mind as his did not reflect upon affairs, and privately arrive at some conclusion not favourable to the dominant régime. We do not, however, obtain from this biography any insight into the workings of his mind between 1815 and 1830. He does not seem to have discussed political affairs with his most intimate correspondents. And it is highly improbable therefore that he said much about them in society. Mr. Disraeli told us two years ago that Lord Palmerston greatly disliked talking politics anywhere except in the House of Commons, and that when pressed on such subjects he commonly took refuge in banter. Mr. Greville tells us in his *Memoirs* that Palmerston's abilities were unsuspected till he became Foreign Secretary, and that even Mr. Canning was unaware of them. Both these statements confirm what the biography naturally suggests—namely, that Lord Palmerston was very reticent on politics, and that whatever he thought of the progress or tendency of events in the reign of George IV., he said very little about it. When the time came, he took his side with Mr. Canning as naturally and easily as if he had always ranked among his followers; though, as we have already said, the presumption is the other way. And when the time came again, he passed on to the standard of Lord Grey just as naturally and easily as if he had always been a Whig. Nobody ever seems to have wondered "what Palmerston would do." His transitions provoked no comment and no surprise, and it is clear that he was one of those men who, do what they will, contrive to make it appear that such was the obvious and only course of action, and that nothing else could have been expected. What we have to complain of in Lord Dalling is his negligence on such points as these. The characters of public men are among their most valuable legacies to posterity. And more especially in times like our own, when a certain amount of political flexibility is rendered almost inevitable by circumstances, it is interesting to study the process by which a man of Lord Palmerston's reputation passed from one set of opinions to another. We cannot accept the conventional theory of his opponents, who say that come what might, he would still be Vicar of Bray. For he showed by his conduct in '28 that he *could* resign on provocation. Neither can we readily believe that he simply drifted before the wind, and decided on circumstances as they arose without reference to the past or the future. Whatever the explanation may be, the fact still remains, that Lord Palmerston changed from a Tory of the Perceval school to a Tory of the Canning school, and from a Tory of the Canning school to a Whig, by such smooth and imperceptible degrees that the result when it came always seemed a natural consequence. The change was as gradual as the change of

a tidal river from fresh water to salt. And though Lord Dalling notices the fact (p. 2, vol. i.), his interpretation of it amounts to little more than an identical proposition. In the ablest memoir of him which has yet appeared (*Times*, Oct. 17, 1865), a simpler and perhaps truer theory is propounded to the effect that the only thing in which Lord Palmerston was really interested was foreign policy; and that, provided he could see that carried out according to his own ideas, he cared little whether his associates called themselves Whigs or Tories. His foreign policy was or was meant to be Canning's foreign policy. This was represented in the governments of Lord Goderich and the Duke of Wellington by Lord Dudley, whose resignation was accompanied by Lord Palmerston's, and in the Reform Government by Lord Palmerston himself, so that according to this theory he sacrificed nothing by his successive transformations. At the same time we must remember that Lord Grey, who appointed Lord Palmerston to be his Minister for Foreign Affairs, was hostile to Canning's foreign policy, and spoke of it in 1827 with scorn and bitterness. Remembering this, how could Lord Palmerston have taken office with Lord Grey three years afterwards on the ground that he should then be enabled to carry out this very same system? As far as domestic questions were concerned, Lord Palmerston certainly does seem to have looked upon them rather with the eye of an outside observer than of an interested participator. Thus we find him writing of the Duke of Wellington's government in 1828: "All this, instead of a pig-tail Tory government, shows the great strides which public opinion has made in the last few years. Such a government as Liverpool's even cannot now be established, and such a one as Perceval's could not be for a moment thought of." One would hardly suppose from these words that he himself had been a member of both these governments. He seems to have been looking back upon himself, as it were, in a previous state of existence, and criticising himself from without as if he had lost his personal identity. This attitude of mind is certainly not compatible with strong political convictions. But it is quite compatible with the view of his character propounded in the *Times'* memoir, according to which his god was public opinion, a deity more powerful in the long run than the brute force of the mightiest monarchies, and true to her votaries through every conjuncture of affairs.

"He that hath this is clad in complete steel,"

was Lord Palmerston's doctrine, and his own career is certainly a confirmation of the theory.

Then comes the question what *was* Lord Palmerston all this time? He put on and put off the livery of successive parties or sections of parties with apparent indifference. But with which must we finally rank him? or is he to stand out by himself, a figure either towering above, or standing aside from, all recognised parties, like Lord Chatham or Lord Shelburne? On this subject we shall quote a passage from one of his letters to Mr. Cowper, with Lord Dalling's comment thereupon, which are both

interesting, though in our opinion decidedly misleading. The subject of it is Palmerston's acceptance of office under the Duke of Wellington:—

"The Whigs of course will be furious and violent, and lay about them to the right and left. I very sincerely regret their loss, as I like them much better than the Tories, and agree with them much more. But still we, the Canningites, if we may be so termed, did not join their government, but they came and joined ours."

This statement is remarkable for various reasons: among others, for the singular aspect under which it exhibits the political *θῆος* of Lord Palmerston. His whole life had been spent as a Tory Minister, and for twenty-one years he had been one of the recognised opponents of the whole policy of the Whigs. And now we find him declaring that he likes them much better than, and agrees with them much more than, with the Tories. If he had secretly sympathised with them during this long antecedent period, he ought not to have allowed it to be supposed that he sympathised with their rivals, or have conferred on the cause which he condemned the moral advantage it derived from his presumed approval of it. But if the change was a sudden one, then, *how* sudden! Or are we to adopt the hypothesis, after all, that he really never *had* thought seriously about politics till the death of Lord Liverpool compelled him, and that then when he did for the first time examine his own mind upon the subject, he found himself three parts a Whig? Lord Dalling does not seem to see how prominently the passage we have quoted brings this question before us. All that strikes him is its bearing on the nomenclature of parties. "We see from this letter that a Canningite at that time was not a Whig—was not a Tory. What was a Canningite?" Now, in the first place, it is no answer to the question we have just raised to say that Lord Palmerston was a Canningite, for before 1827, if the name was not unknown, it was applied merely to the personal admirers of that great man, and represented no complete set of principles. When people wanted to distinguish between the two branches of Toryism we have already mentioned, they spoke of the Pitt party, and the Addington or Perceval party. Canning was the head of the first, but not the founder; and when Lord Dalling asked, What is a Canningite? the true answer is that he was a Tory of the eighteenth century instead of the nineteenth; that he belonged to that earlier school of Toryism which it is the boast of Mr. Disraeli to have succeeded in reviving, the Toryism sketched out in the *Vindication of the British Constitution*, and afterwards in *Coningsby* and *Sybil*: the Toryism which the present Prime Minister prophesied thirty years ago would rise from its ashes, and prove that the party which professed it was the "popular political confederation of this country." Lord Palmerston himself, when he talks of "we Canningites" as distinct from the "Tories," was only using the conventional abbreviation which was perfectly understood by his contemporaries. The word Toryism was used colloquially and for convenience sake of that section of the party who, as we have said, had been the dominant half of it

from the death of Pitt to the death of Lord Liverpool. Men could not take the trouble every time they wrote a letter or spoke to an acquaintance in the street to enunciate some elaborate formula for the sake of preserving a distinction which everyone understood without it. But the simplest way of settling the question here mooted is by asking another one: what did Mr. Canning call himself? If Canning was a Tory, it is nonsense to pretend that a Canningite was anything else. And that Canning was not a Tory will scarcely, we should think, be asserted by any well-informed or impartial critic. Lord Palmerston, however, was, in our judgment, but a poor specimen of a Canningite. He saw that Mr. Canning was a Liberal Tory, and he believed that public opinion was in favour of liberality. Therefore he was a Canningite. But of the deeper and more ancient principles of that creed he had, we fancy, but little appreciation. At all events, he ceased to be a Canningite when he entered the Cabinet of Lord Grey as a sweeping Parliamentary Reformer, though in his later years, when men again began to call him a Tory, he had reverted to Mr. Canning's dislike of Parliamentary Reform. It may be doubted, however, whether even then he was really treading in the footsteps of Mr. Canning. The Constitution of 1827 was one thing; the Constitution of 1862 was quite another. The former possessed popular elements, as Lord Dalling points out in his *Life of Sir R. Peel*, in which the latter was deficient. And it by no means follows that because Canning upheld the system which existed before the Reform Bill, he would equally have upheld the system which that measure introduced. "The rotten borough system fell," says Mr. Froude, surely an unimpeachable witness on the subject, "not because it was bad in itself, but because it was abused to maintain injustice—to enrich the aristocracy and the landowners at the expense of the people." Without enquiring too closely into the truth of this assertion, it is evident that Canning, who was prepared to remedy this injustice and to abate the corn laws, was in no way called upon, according to Mr. Froude's ideas, to abolish rotten boroughs. These, according to our popular historian, were part of that true aristocratic system, namely, the government of the best for the good of the most, which is the central idea of popular Toryism, though lost sight of for a time in the early part of the present century. It is, however, Mr. Froude's idea and not ours, that rotten boroughs were a right means to the end.

Of Lord Palmerston's career at the Foreign Office, as far as it is included in the present volumes, the chief memorials are the establishment of the kingdom of Belgium, the Quadruple Alliance of 1834, the Syrian intervention of 1840, the Swiss intervention of 1847, and the correspondence on the Spanish marriages. Many minor transactions likewise come within the same period, altogether leaving an impression, that although the part which Lord Palmerston had prescribed to himself was dictated by a genuine regard for the greatness and dignity of his country, he too often overrated it, and created a storm in a teacup. The writer of the memoir in the *Times*, to which

we have before referred, seems to think this a feather in his cap, and facetiously observes of him that "Palmerston, it was thought, would move the whole force of the British Empire that Brown might not be defrauded of his Worcester sauce amid the ice of Siberia, or of his pale ale on the Mountains of the Moon." And Lord Palmerston himself, in the third volume of this essay, assigns a very good reason why the defencelessness of minor powers should not shield them from the consequences of actions for which stronger ones would be called to account. The only question is, whether it was not the smallness of the grievance, not the weakness of the offender, which sometimes justified the criticisms bestowed on Lord Palmerston's foreign policy—whether he was not too quick to see an insult where none was intended; and whether by reason of this infirmity he did not compromise the dignity of Great Britain nearly as often as he upheld it. It is difficult to imagine Lord Chatham or Lord Grenville ordering up the Mediterranean fleet to settle a squabble about a sulphur monopoly, or bullying the kingdom of Greece about Don Pacifico. However, opinions will probably differ to the end of time about this and similar transactions, while, on the other hand, there can be no dispute about the importance or the dignity of the other affairs which we have mentioned. The establishment of the kingdom of Belgium was the next best thing to maintaining its connexion with Holland, and that perhaps was impossible. The Quadruple Alliance secured a fair trial for the principles of constitutional government in France, Spain, and Portugal; and if they failed in either, that was not the fault of Lord Palmerston. The Syrian policy saved Egypt from becoming a province of France. The remonstrance of Great Britain in 1847 against a Franco-Austrian intervention in Switzerland, gained time for the two parties to fight out their own quarrel, and averted very serious results. The Spanish marriage, however, Lord Palmerston was unable to prevent; and this partly because he seems to have been deliberately duped by the French government—not the French Ambassador—partly because he characteristically supposed himself to stand in no need of any warnings from the scene of action, and persisted in neglecting all the hints conveyed to him by Lord Dalling, who was then our representative at Madrid. He would look at every question that arose from a purely English point of view, and made no allowance for the different constitution of the Spanish Court and government, and the want of public opinion in the country. A victim to his idiosyncrasy, and to the then fashionable belief that constitutionalism required only to be seen to be beloved, he certainly ran his head against walls which he might easily have avoided, and made it a much easier task for the French to have their own way than it otherwise might have been.

The key to Lord Palmerston's foreign policy in general was his theory of "English interests." He thought that Lord Aberdeen and ministers of that stamp were too much inclined to curry favour with foreign governments by waiving what was due to

ourselves; and he took his own stand on the doctrine that, cost what it might, when the interests of this country pointed clearly in one direction, the policy so indicated must be followed. He construed the word "interests," moreover, in a large and comprehensive sense, including in it the honour and dignity of Great Britain, as well as her material prosperity. His second doctrine of non-intervention was always made subservient to the first. And he cared little for the charge of inconsistency when he proceeded even to armed intervention, as he did in Portugal and Syria. He always decided the idea that you were never to remonstrate with a foreign power unless you were prepared to fight. Opinion, his special idol, had a force of its own which could always make itself felt more or less, and there might be many cases in which it was politic to make the most of it, without its being desirable to go further. Still, of course, Lord Palmerston never shrank from the alternative of arms. He held English interests to be involved in the highest sense of the term in the "balance of power," and as lately even as the last Danish war was ready to have carried out his principles. It is unfortunate that his biography is not continued to his death. His correspondence on the Crimean War, the Indian Mutiny, and the American Civil War would have been invaluable. But we still hope that other hands may complete what Lord Dalling has begun, and give us at last a finished portrait of one of the most famous Foreign Ministers, and one of the most popular statesmen, which our Parliamentary annals have to show.

Of Lord Palmerston's private life many interesting glimpses are obtained in these volumes. His hunting, and racing, and shooting, his gardeners and gamekeepers, and all the various little details belonging to the life of an English country gentleman, appear at intervals in his letters. There is more about shooting in the book, however, than about any other sport; and he seems to have paid considerable attention to his pheasant covers, and to have always looked forward to September with undisguised pleasure. We could wish the life had been written by one who had lived more in his society, and could to a certain extent have Boswellised him, as he would have repaid the process more perhaps than most of our public men. As it is, the book, though a valuable contribution to history, is upon the whole rather dry, and very unlike what one's imagination had previously conceived of a Life of Lord Palmerston. T. E. KEBBEL.

The Life of Samuel Lover, R.H.A., with Selections from his Papers, &c. By Bayle Bernard. (London: Henry S. King & Co., 1874.)

GENIAL Samuel Lover, the Irish songster and painter, forms a pleasant subject for a chatty biography, and Mr. Bayle Bernard gossips agreeably about his hero through a plump volume of 343 pages. Mr. Bernard has a belief in Lover's actual and possible capabilities almost naïf in its elasticity: so catching is his enthusiasm, so sociable his way of enlisting a reader's sympathies, that

we may find ourselves sliding into conviction that the long list of titles which opens the preface—poet, novelist, dramatist, painter, etcher, and composer—was indeed borne by Samuel Lover as one of the giants of genius. This, of course, would be far from the mark. Lover shared the misfortune well said to be incident to men of various gifts and pursuits, "they are perpetually waiting in ante-chambers, and losing time in them;" yet because his happy nature had a spring of spontaneous impulse towards many cognate subjects of study, and the force of his character carried him through the irksomeness of preliminary drudgery, and enabled him to wait patiently for reward, he certainly did exhibit a very respectable versatility of success in both literature and art. He was a lucky man: from the time when he breathed health among the mountains of county Wicklow, and was transmogrified from a puny child of over-sensitive brain into a stout lad of thirteen ready for anything, up to his death at St. Heliers in his seventy-second year, fortune smiled kindly on him. His constitution was splendid, his temperament joyous, his heart was brave and tender; he seemed to throw off misfortune and breast a contrary tide like a hardy swimmer. So genial a topic might excuse a biography with less good sense and humour than this volume of Mr. Bernard.

Lover's parents were well-to-do folk in Dublin; the father, a stockbroker, would fain have turned his boy's sharp wits to substantial account in the office. The lad was obedient awhile, but the artistic impulse having manifested itself in attempts at original music, poetry, drawing, the drama, and heaven knows what else, and parental opposition only fanning the flame, the end was that with the profession of artist yet to learn in its rudiments, Samuel left his father's house and set up as a painter to gain his own living. He is supposed to have won his bread at first by giving lessons in drawing while he was yet teaching himself, perhaps to have copied music, perhaps to have taken likenesses; any way, he emerges out of a recordless term of three years as a marine painter; then he took with characteristic changefulness to miniature portraiture, and with the luck that followed his honest efforts soon obtained good sitters, kind patrons, and a moderate success. He may be said, however, to have painted, sung, and scribbled the world into good humour with him: when no portraits were on commission he wrote humorous articles for the *Dublin Literary Gazette*, without fee at first, till the "Story of a Gridiron" achieved a popularity that ensured payment for subsequent efforts. Then a fortunate accident brought him forward at the brilliant banquet given at Dublin to Moore in 1818, as the only complimentary songster of the evening, and his "Poets' Election," sung by himself to a well-known tune, brought applause from the guests and thanks from Moore that were the commencement of a long friendship. Eminent social gifts procured the young man admission into a brilliant society, of which Mr. Bernard gives an interesting description: Maturin, the clerical novelist and dramatist; the "exhilarating Brophy," as the

writer calls him, a dentist, who not only wrote laughter-moving poems, but joked his patients out of their toothaches; Lady Morgan, and others likely to keep a genius of Lover's stamp in good working order by constant friction, were among the stars of the circle.

The chief points in Lover's career may be soon noted: his pictorial efforts won him the post of Secretary to the Hibernian Academy; he wrote a successful drama, and more successful novels; then he illustrated the political satire of "Jonathan Buckthorne," called the Irish Horn Book, by caricatures of his own etching; he continued to write songs and compose music for them as the humour seized him; and he painted a good miniature portrait of Paganini. This last feat was a turning point, for the miniature, hung in the Royal Academy of London when the Paganini furore was still raging, turned eyes approvingly on the artist, and so encouraged Lover to come to London, being then forty years old. Here he continued the same versatile career amid the pleasures and advantages of London society. His comedies were well acted by Tyrone Power, and the fascinating Vestris patronised his productions and sang his songs. When photography diminished the demand for miniature-portraits, and the practice of etching had weakened his sight, Lover, with characteristic elasticity, betook himself to the vocation of interpreter of his own tales and songs, and organised a little entertainment after the fashion since become so popular. He went to America, and made a pretty purse and many friends in the course of a tour from New York to New Orleans, and through Canada. When he came back he took to landscape painting in oil at fifty-five years of age; revived his entertainment with American additions; married a second wife; wrote musical pieces for the Haymarket and Lyceum, and libretti for Balfe, and edited a volume of Irish lyrics. The last four years of his life were troubled with illness; he had to seek quiet and a mild climate in Jersey; but his faculties and accomplishments remained within his conscious enjoyment, till his cheerful spirit passed into the shades in 1868.

Mr. Bernard writes of Lover's artistic position with over-fondness, which is a pity; for to claim too much honour for the gifted Irishman, and to range him with greater men, is only to draw down unfavourable comparison. Lover's place as a painter has been judged by his contemporaries, perhaps a little carelessly: his miniatures find their way into public collections, his compositions and landscapes are remembered or known by few. His talent in this direction was mediocre, though marked by a certain freshness that pervaded all he did. As a writer, as a humourist, he, however, deserves a cosy niche in Fame's temple. His humour was true metal, ringing with no uncertain sound, racy as of pure Irish extraction, in its quaintness approaching the oddity of American humour, and akin to that of our own Charles Dickens in a certain colour of the picturesque and lurking tenderness. The second volume of Mr. Bernard's biography furnishes some good specimens in "Paddy at Sea," and "Re-

jected Addresses," "A Plea for Potheen," and the delicious "Molly Carew." Fine touches of humour sparkle in most of his songs, and it is as a song-writer that Lover ranks highest. As a musician, apart from the words for which the music was written, he can scarcely be criticised; the lyric faculty was in him altogether bird-like; melody and verse welled up together in his mind. He never studied music with sufficient science to do more than fit accompaniments prettily to his simple airs, but these are tender and sweet and singable—a great virtue where the music is only a vehicle for helping the impression of the words. In a capital chapter on the Songs of Ireland Mr. Bernard points out how the Gaelic poetry that has lived is the lyric: "it is as though the people were so musical they cared for nothing they could not sing." Thus, metrical descriptions or narrative are rarely met with in Gaelic, while love songs, drinking, martial, patriotic songs abound. Lover came into a rich inheritance when he took his place among the songsters of Ireland, but he was no plagiarist. He showed originality by drawing his inspiration from peasant life, though his own social experience lay elsewhere; and all his best songs are of the love and humour of "Paddy." In chapter xi., again, Mr. Bernard writes with sensitive critical faculty on the functions of the song-writer: "he is still the poet, who proposes to enlarge emotion by the aid of melody. He may compose his airs himself, or he may borrow those of others; but music must be, and is at all times his indispensable auxiliary." The verses of Arndt and Körner, of Heine, of Rousseau, of Dorat and Victor Hugo, are rightly designated as "short and completed poems, containing all the emotion they require, and in which we feel that the wit and fancy are after all the chief ingredients." This is very good, but surely it is a mistake to have put in the same category with the poets named above, Herrick and Waller! Lover himself had a clear notion of some of the necessary qualities for a perfect song. "As many open vowels as possible," he says: "condensation, elasticity, firmness and variety of rhythm, correct accentuation and good singing, rather than good poetic or reading phraseology." He writes thus with his double insight as poet and musician, and from his humble standpoint hits a truth which wiser and richer brains than his are developing even now.

Apart from the personal topic of this biography, there is much to amuse and interest in the pictures from Irish life of last century and the commencement of this, a period of rapid political and social changes, phantasmagoric in brilliant or terrible aspects. Mr. Bernard writes as a warm sympathiser with Ireland, but without temper. He evidently revels in the quick susceptibilities, the racy humour, the arch impudence and quicksightedness of the people, and his pages are sown with anecdotes and "bulls" most aptly quoted. It is tempting to quote him, but it is only fair to refrain from picking the plums out of the cake.

In this grave age of sorrowful problems we must thank so cheerful a biographer as Mr. Bernard. "I'd rather have a fool to make me merry than experience to make me

sad," says Rosalind; and we may well pause a moment before the genial presence of Samuel Lover presented to us in these pages.

A. D. ATKINSON.

A Ramble Round the World, 1871. By M. le Baron de Hübner. Translated by Lady Herbert. In Two Volumes. (London: Macmillan & Co., 1874.)

In the two volumes before us we have an English version of Baron de Hübner's *Promenade autour du Monde*, which was published at Paris in 1873; and all who delight in a really good book of travel will do well to read this narrative of a trip round the world, which was undertaken entirely from an ardent love of seeing new countries and peoples. The author tells us that the objects of his journey were

"to behold, beyond the Rocky Mountains, in the virgin forests of the Sierra Nevada, civilisation in its struggle with savage nature; to behold, in the Empire of the Rising Sun, the efforts of certain remarkable men to launch their country abruptly in the path of progress; to behold, in the Celestial Empire, the silent, constant, and generally passive, but always obstinate, resistance which the spirit of the Chinese opposes to the moral, political, and commercial invasions of Europe."

Considering that he only allowed himself eight months in which to complete this delightful programme, we are bound to say that M. de Hübner made a very good use of his time; and, although we do not pretend to accept all his *dicta* without reservation, he has conclusively shown that he is gifted with keen and accurate powers of observation. Thanks to his own carefulness, and the valuable assistance placed at his disposal in every place which he visited, these volumes contain comparatively few of the mistakes which so commonly disfigure works of this nature.

M. de Hübner started from Queenstown on May 14, 1871, and after brief visits to New York and Washington, he passed on to Chicago, giving his readers an amusing account of the long railway journey. In his rambles about "the great emporium of the West," he was much astonished at *meeting* a house in the middle of the road, and at first he was sceptical, and would hardly believe his own eyes; but

"very soon all doubt on the subject is at an end. Placed on trestles resting on cylinders, one horse and three men, by means of a capstan, do the work. . . . A veranda in full flower trembles under the slight shaking of the cylinders. The chimney smokes; they are evidently cooking. From an open window I catch the sounds of a piano. An air from *La Traviata* mingles with the grinding of the wheels which support this ambulatory domicile."

From Chicago to Salt Lake City M. de Hübner travelled most luxuriously in one of Pullman's palace-cars. During his stay at the capital of the Mormons, he takes the opportunity of investigating the cause of the periodical difficulties with the Indians, but he does not give much information that is new respecting Brigham Young and his followers, although he tells an amusing story (not without its moral) about the President caning one of his own forty-eight children in the street, without being in the least aware of the identity of the object of his

wrath. The chapter on San Francisco will be read with interest, as our author describes in graphic terms the origin and present condition of that rising town; he arrives at the conclusion that "New York and London are evidently distanced by San Francisco," and he finds the explanation in the fact "that everything has to be created from the very beginning." In speaking of this place he makes some sensible observations on the unfair treatment of the large Chinese element in the population of the Western States, remarking that numbers of them in consequence, instead of settling permanently in the country, return to China and—

"carry away in their trunks the fruit of their long and patient toil; in their minds a sovereign contempt for our civilization; and in their hearts the bitterest hatred of the Christian."

Whilst at San Francisco, M. de Hübner made an excursion to the "Big Trees" of Mariposa and the Yosemite valley, and although he enjoyed what he saw very much, he seems to have found the journey tedious.

Our author next crossed the Pacific to Japan, in which country he spent ten weeks, making some pleasant excursions and visiting the chief treaty-ports and the capital. On the whole he considers that

"there is no great town in Asia, and very few even in Europe, which, on the score of cleanliness, can be compared to Yedo. It has also a look of prosperity and gaiety which is pleasant to see."

During his stay there, through the good offices of Mr. Adams, Her Majesty's Chargé d'Affaires, he was presented to the Mikado, and introduced to Iwakura and other leading statesmen, with whom he held long conversations respecting the recent reforms in Japan. With some difficulty he obtained permission to visit Kiyôto, until lately the residence of the Mikados, and when there, by dint of perseverance and audacity, he even contrived to penetrate into the very *sanctum sanctorum* of their palace or castle, with which, after all, he seems to have been disappointed. He gives some notes about Japanese history and the persecution of the Christians, and he concludes this portion of his narrative with a summary of the present state of the Empire. He is of opinion that in their reforms the Japanese have not set to work properly, for it appears to him

"that any work of reform ought to begin by touching the hearts of men; it ought to implant charity and the renunciation of self. . . . The result would be, respect for property and private rights, and honest guarantees for public order, without which trade will never flourish. Then the moment would arrive for telegraphs and railroads. To begin by them is to set the cart before the horse. A man may learn to work the telegraph wires and drive a locomotive, and yet remain a barbarian, sharpen his sword on the first man he meets after leaving the station, or, if the station-master has reproved him, perform *hari-kari* to avenge his injured honour."

We are next taken to Shanghai, the chief centre of foreign trade in China, which, for some reason which is not clear to us, M. de Hübner describes as "the great metropolis." The foreign settlements, especially the British, excite his admiration, at which we are not at all surprised; and the native town, too, was better than he had been led to expect, at any rate it was no worse than

towns in the south of Europe, which, however, is somewhat negative praise. Confused probably by the extreme novelty of all that surrounds him, our author falls into some curious mistakes, which all tend to show how impossible it is for any one to write accurately respecting a place like Shanghai on the strength of a week's residence there. A similar remark applies to the observations which he noted down in his journal while at Peking, for, notwithstanding the aid of skilful *cicerones*, he gets out of his depth in several matters which we have not space to specify. To give but one instance, he speaks of the Imperial City as "inaccessible to mortals." This may be, and we believe is, the case nowadays; but the way in which M. de Hübner writes would lead his readers to think that it had always been so, whereas less than a dozen years ago any one who chose (we speak from personal experience) could ride or walk all over it, excepting, of course, the inner enclosures, which contain the Imperial Palace, properly so called. Peking must almost of necessity disappoint every one's preconceived notions respecting the capital of so vast an empire as China, and M. de Hübner is no exception to the generality of travellers who visit it. He likens the place to "a great camp of barbarians bivouacking round the tent of their chief;" and he considers it "the type of the ancient cities mentioned in the Bible." As every traveller feels bound to do, he visited, among other sights, the Summer Palace, and made the usual pilgrimage to the Ming Tombs and the inner Great Wall, but we suspect that the mode of travelling was too rough to induce him to satisfy his curiosity respecting the outer and, as we think, more interesting portion of the frontier wall of China. After an interview with the Prince of Kung, he returned to Tientsin, where, being weather-bound for a few days, he occupied his time in analysing all the circumstances connected with the massacre of the Roman Catholics, a subject to which he devotes considerable space. At length he got away from Tientsin, and in due time reached Hongkong, of which he gives a very true description, ending by likening it to "Ventnor or Shanklin seen through a magnifying glass and under a jet of electric light." He was charmed with Canton, and had special facilities for seeing all that was worth a visit there. So high an opinion, indeed, does he entertain of that city, that he goes so far as to say that "he who has not visited Canton has not seen China." He gives a melancholy account of the condition in which he found Macao:—

"At every step," he says, "one comes upon imposing buildings. They are old convents of monks and nuns, now transformed into barracks without soldiers, museums without any of the treasures which they are destined to hold, and public offices full of clerks who are dying of hunger."

M. de Hübner left Hongkong for Marseilles on December 6, and, taking advantage of the leisure afforded by the voyage home "to sum up his impressions," he discusses the various phases of the missionary question in China and the position of that country in regard to its interior state

and policy, as well as its relations with foreign powers. He is of opinion that in order

"to persuade the Chinese to accept our civilisation, we must act on their hearts more than on their minds, which are far more open than people generally think. . . . The Chinese are not like the Japanese. . . . They are serious-thinking men. They will adopt our civilisation when they begin to understand it, but they will not understand it till the day arrives when they choose to do so."

We regret that we cannot speak very highly of the English rendering of this work taken as a whole, for Lady Herbert is undoubtedly not happy as a translator. The volumes before us abound in errors of all kinds, which we cannot but lay at her door, and of which we must not omit to note that she reserves the right of reproduction. The Gallicisms, too, which are to be met with here and there, are sometimes rather startling—e.g., "the five treaty-ports" of Japan are described as "the five ports called 'of the treaties.'" EDW. DUFFIELD JONES.

Religious Thought in England from the Reformation to the End of last Century: a Contribution to the History of Theology.
By the Rev. John Hunt, M.A. Vol. III.
(London: Strahan & Co., 1873.)

MR. HUNT is to be congratulated on the completion of a task involving great labour and research, which he has executed with signal candour, impartiality, and ability. It is not often that even the most enthusiastic explorers of the province of theology are at once so persevering and so fortunate as to pursue and bring to successful accomplishment a scheme of fourteen years,—a scheme moreover originally conceived, as he confesses, with far from adequate notions of its difficulty and extent.

The Preface to the present volume—another of those somewhat naïve confidences whereby Mr. Hunt enables his readers to follow the elaboration and modifications of his design—puts us in possession of the history of the entire undertaking. It is ten years ago, he tells us, since he submitted the outline of his work, first conceived and commenced some four years before, to his chief adviser, the late Professor Maurice. His experienced Mentor "smiled incredulously," and foretold a herculean labour of twenty years. Half that time has already expired, and Mr. Hunt frankly admits that "the present work is only the completion of the second chapter, and the first will have to be re-written." He is however, we are glad to find, neither weary nor fainthearted, and we learn that the History of Religious Thought in England will be followed, in all probability, by a History of Religious Life. Such an undertaking, it is evident, will make demands upon powers of a somewhat higher order than those called into requisition by a rapid sketch like his "Pantheism," or by a series of careful analyses like those in the volume before us. While requiring in an equal degree the exercise of an impartial judgment, it will also render indispensable the employment of that sympathetic faculty which, in a work like the present, it has been necessary to keep almost entirely in abeyance; and however sincere the

desire to do equal justice to all, the author's delineations will probably elicit far more criticism than his past efforts.

In his present Preface the author takes occasion to advert to some exceptions that have been taken to the title,—that he has written, for instance, rather about theology than religion. "I have written," he says, "a history of opinions concerning religion." But this definition is surely less comprehensive than his title, for speculation and the influences under which speculation is evoked are often quite as important as the "opinions" ultimately formed, and far more interesting. Bishop Hoadley, Mr. Hunt tells us, in a celebrated sermon which proved the occasion of a long and important controversy, once took occasion to comment on the change of meaning which some words undergo, and instanced as an example the word "religion," which, he said, "in the time of St. James, meant virtue and integrity in ourselves, with charity and beneficence to others, but had come to mean everything but virtue and charity." We are not at all sure that many an orthodox reader, on glancing over the "thought" that finds admission to these pages under the names of Conyers Middleton, Tindal, Chubb, Bolingbroke, and Hume, will not feel inclined to share the bishop's opinion. To such a criticism Mr. Hunt might reasonably reply, that it was the demonstrations of scepticism which evoked the achievements of belief, and that had the eighteenth century been less immoral, unbelieving, and materialistic than it was, the *Alciphron* of Berkeley, the *Analogy* of Butler, and the *Evidences* of Paley would probably never have been written.

We miss in this volume but few names or works of any importance, the most serious omission being that of any reference whatever to Butler's *Sermons*,—discourses which, in point of value as a contribution to the religious and philosophical thought of the age, rank second only to the *Analogy*. Bishop Law, the translator and editor of King's *Origin of Evil*, and editor of Locke's works, who played so important a part in connexion with the question of subscription, might perhaps have fairly received more consideration; and it is singular that, in enumerating the works of William Law, Mr. Hunt should have omitted all reference to the *Serious Call*, a work to which Dr. Johnson was wont to attribute his own adoption of more decided religious views, and which is interesting both from its wide-spread popularity and as a reflex of the new school of German mysticism. The *Light of Nature*, by Abraham Tucker, is dismissed in four lines in the Appendix. It would have been better to offer some other reason for thus passing by the work than that it "really contains little that is original." Paley declared that he found in this writer "more original thinking and observation upon the several subjects he had taken in hand than in any other, not to say than in all others put together;" and Sir James Macintosh regarded the neglect of his writings "as the strongest proof of the disinclination of the English nation, for the last half-century, to metaphysical philosophy." The introduction of one or two chapters on the influence of contemporary French literature and the pro-

gress of scientific enquiry, would have gone far to render more intelligible much of that theological activity which the volume sets forth. A concluding chapter of some thirty pages gives us, it is true, what the author describes as "a general review of the whole;" but this does nothing in the direction we have indicated, and seems indeed scarcely a worthy pendant to so considerable a performance. A work like this should have a good index; the one here given, so far as we have tested it, is both faulty and defective.

But omissions and shortcomings like these, which can easily be made good in a subsequent edition, detract but little from the general utility of the work. The student who has it on his shelf will have at his command a lucid and trustworthy history of nearly every notable defence of the faith and every phase of theologic doubt during the three centuries that followed on the Reformation. In his Preface to the second volume, Mr. Hunt expressed his hope that the work would "save a great deal of writing," "for many men would see that all they had to say had been said already." This in itself would not necessarily be a valid reason why they should not say it again. Half of what in the present century has come to be regarded as almost axiomatic in science and philosophy, was first enunciated amid derision and contempt by individual thinkers, and only gained acceptance at last through reiteration with increased emphasis on the part of their disciples. But it will undoubtedly be of service to our young theologians to see that the doubt and distrust of their own age are in no way peculiar either in matter or form to the nineteenth century, and they will find it of value, while examining the arguments by which scepticism was supported or opposed generations ago, to compare them with those of the present day, and to endeavour to decide for themselves to which party learning, science, and discussion have brought the greater accession of strength.

It may be not unnecessary to observe that these volumes, though judiciously relieved by anecdote and narrative, cannot be regarded as light reading. Analyses of profound argument could hardly be expected to prove so; and occasionally Mr. Hunt's conciseness necessitates a pause, in order to grasp the connexion of the sentences. It is to be hoped, and we may be sure it is his wish, that the work may in no way supersede the study of at least the more important writers to whom its pages form an introduction, but may rather serve to point out to the student where discussions of this or that difficulty are to be found, and thus allure him to the perusal of many a good old author too much forgotten amid the demands of modern literature.

J. BASS MULLINGER.

The Danish Intrusion into South Britain.

Read before the Literary and Philosophical Society of Liverpool, Jan. 26, 1874.
By Joseph Boulton, F.R.I.B.A.

MR. BOULT has already, it appears, tried to prove that the Angles and Jutes were "not Teutonic foreigners, but sections of the Keltic Britanni;" he now proceeds to demolish what he calls "the theory of the Danish planting of England." His own ideas as to

the extent of the Scandinavian element in the population of the island are not very clearly expressed; but his arguments are mainly directed against the assumption that characteristic local names are to be taken as indicative of a Danish or Norwegian settlement. Where others see evident traces of the colonising Norseman, he detects the "indigenous" Kelt. The plan upon which he proceeds is simple enough. Ignoring historical and all other evidence, he confines himself to the Keltic Dictionary, from which with more or less ingenuity he manages to extract equivalents for the well-known suffixes which are generally regarded as Scandinavian in origin. Thus, in place of the D. *byr*, he suggests as original forms of *-by* the K. *buar*, cattle; *bith* (bee), the living; *bid*, a hedge; or, by substitution of *b* for *f*, *fidh* (fee), a wood; while *-thorpe* he derives from the K. *dorbh*, grass; *-thwaite* from the K. *tuath*, a tract of country, and similarly with the rest. It is not difficult to see, however, that Mr. Boulton's etymological speculations are not grounded upon any real knowledge of philology. One who speaks of K. *tan*, a territory, as the root of E. *town*, and of K. *am*, people, as the original of A.-S. *ham* and E. *home*; or who goes the length of deriving Bath from K. *bo*, a cow, through the medium of *bo-tigh* (bothy), a cow-house, can hardly be looked upon as a trustworthy guide. The digression upon personal nomenclature is no less unsatisfactory. It is no good to claim as compounds of Keltic words such names as Olaf [*ollamh*, a chief professor in any science], Thorketil [*tor-cet-il*, great counsel month], and others, without accounting for the fact that it is in Norse history and poetry, and in Norse countries, that they most persistently occur. There is the same incompleteness in Mr. Boulton's main argument, for he leaves out of sight the significant manner in which the local names, the Norse origin of which he denies, are distributed. If they are Keltic, it is singular that they should be confined precisely to those districts of England in which the historical accounts place the settlements of the Northmen, and equally so that the peculiar suffixes by which they are distinguished should at once be common in Scandinavia, and extremely rare in the confessedly Keltic parts of our island. The existence of the Danelaga is an historical fact which Mr. Boulton does not dispute; but he insists that the territory which it comprised was so called, "not because Danish laws were established . . . but because Danish kings maintained law or order, for the K. *lugh* signifies order." And this seems to be the position which Mr. Boulton assumes throughout. There was an "intrusion" of Danes into England, but no "immigration;" in other words, their occupation of the country was purely political and military in its character, having no more effect on the population than is the case with the English occupation of India. If such a theory is to be accepted, stronger arguments than those of Mr. Boulton must be adduced in its support.

GEORGE F. WARNER.

Idolatry: a Romance. By Julian Hawthorne. In Two Volumes. (London: H. S. King & Co., 1874.)

ILL-ADVISED flattery cannot fail to mar the powers which Mr. Julian Hawthorne undoubtedly possesses, and the young writer will do well to disregard the clamour of partisans who have already proclaimed him one of the literary forces of the future, and are engaged in furbishing for his use the massive arms with which his father went forth to battle. Possibly one or two of these weapons may ultimately be suited to him; but the rarer gifts of Nathaniel Hawthorne—the mystic beauty of his fancy, his microscopic insight into human passions and aspirations, the fastidious delicacy of his style—lie, like the sword and sandals of Aegæus, buried under a great flat stone, with a ten years' growth of moss and acanthus on it, and Mr. Julian Hawthorne should be content to bear the white armour and deviceless shield of the novice until he has shown his fitness for attempting to assume enchanted accoutrements. Neither of the romances which he has published shows such fitness. In the second, which is called *Idolatry*, there is descriptive ability of an uncommon order, but scarcely any other of the qualities which entitle a writer of fiction to honourable consideration. Mr. Hawthorne seems to have inherited from his father that faculty of painting basso-relievo which has placed among imperishable memories the scene of the pilloried adulteress, standing with scarlet letter fantastically embroidered on her breast by richest art of needlework, in the crowd of stern-visaged Puritans, and in the presence of her tempter and her avenger. But to quote a few graphic passages as samples of the book is to offer a brick as sample of the house. The younger Hawthorne has not yet learned the golden rule which Septimius Felton could have taught him, that the way truly to live and answer the purposes of life is not to gather up thoughts into books, where they grow dry, but still to be going about full of green wisdom, ripening ever, not in maxims cut and dry, but a wisdom ready for daily occasions. His theories cause him to despise action. He loses himself in the clouds of abstract speculation. He seems unable to move his puppets and interpret their motion at the same time, so he often abandons both puppets and interpretation, and executes a fantaronade on the nature of the soul, the origin of evil, and the like. He follows his father's lead in addressing a preface to the friend whose counsel guided him to fiction; but while Nathaniel Hawthorne recalls the days when his friend and he were boys at school, gathering blue-berries under tall academic pines, watching the logs that tumbled down the current of the Androscoggin, shooting pigeons and grey squirrels, bat-fowling in the twilight, angling for trout in the shadowy stream that wandered riverward through the forest, Julian Hawthorne announces that he "proffers genuine arcana of imagination and philosophy," and begs the reader to bear with him so long as he "goes not the length of fantastically presenting phenomena inexplicable upon any common-sense hypothesis." He should eschew these prefaces, and, borrowing a hint

DR. ROSCHER has now in the press an essay on the English peasantry, discussing the views of recent English writers on the subject.

from the farce-writers, call his romances whimsical improbabilities or grotesque absurdities. And, indeed, we have seen many farces which were truer to nature than *Idolatry*.

The prologue, however, is written with excellent knowledge of picturesque effect. It opens on a summer's day in Egypt. The air is full of lazy warmth, a full-fed river slides in long curves through a low-lying plain, the rich earth exhales the quivering heat of her breath: a dark-skinned race, turbaned and scantily clothed, is standing waist-deep in the water or resting beneath the palm-trees, and a boy of higher caste than his fellows, wearing as a talisman an antique ring suspended to a gold chain round his neck, is swimming in the Nile, which catches him in its cool arms, dandles him, kisses him, woos him imperceptibly onward; when suddenly a crocodile plunges from the bank, with tears in eyes and long grin of serried teeth, and the lad is with difficulty saved by a yellow-bearded, blue-eyed Viking, swinging from the halyard of a boat with broad lateen sail and striped flag at its mast, that drifts down the eddying stream. Egypt, with her pyramids, palms, and river, then fades away. We are brought to a temple built in an Egyptian order of architecture, with panels cut in strange emblems and devices, columns whose capitals are carved with the lotos-flower and bases planted among papyrus leaves, a red granite sarcophagus in each corner, a mummy upright in wooden case between each pair of pillars, statues of Isis and Osiris sitting impassive with hands on knees in the doorway, and at the end an altar of black marble, on which the perfumed smoke of incense mingles with the lamps beneath the high ceiling. This temple has been built on the banks of the Hudson river by a crazy American antiquary, and in it his ministering priest, the boy of the first scene, is joining in marriage the yellow-bearded Viking and his master's dark-haired sister Helen, whom he secretly loves, and to whom after several months he so violently declares his passion that her two children are prematurely born and their mother dies. The name of the priest is Manetho.

The story begins about twenty-five years later, and is mostly concerned with the intellectual diversions of one of these two children, who is called Balder Helwyse. He is described as a young Scandinavian god, whose oriflamme is a sheaf of yellow hair, "with the true hyacinthine curl pervading it," and in this respect he is likened to Samson and St. Paul. He is said to have taken hold of knowledge in all its branches, and in this respect he is likened to a Titan. He is reported to have had the softness, impetuosity, and romantic imagination of Hamlet, and the malignity, coldness, and subtlety of Iago. He could on occasion imagine himself to have the heart of Lucifer burning beneath the cool brain of a Grecian sage. He was endowed with a force of thought to electrify nations, and talks like a young woman who has attended six lectures in moral philosophy. Capable of anything, he does and attempts to do nothing. But on his way from Asgard, abode of immortals, to Manheim, dwelling of men, he passed through a German Univer-

sity, and there learned that the secret of the world was no secret, that nature was a reflection of himself, that God was his elder brother—himself in some distant and attainable condition—and that his senses were the outlets of divinity. His sole weakness was that he ate like one of Mr. Mortimer Collins's heroes. "The generous virtues," he said, "arise from the cultivation of the stomach. Hunger moves man to join in the work of creation, to harmonise himself with the music of the universe, to feel ambition, joy, and sorrow. Eating is earth's first law, and heaven itself could not subsist without it." Having delivered this sermon on Sancho Panza's text that good fare lessens care, he journeyed to New York by sea; and as he sat on the deck of the steamer in a dense fog there came a voice through the mist, "a voice soft, fluent, and polished, from which savage licence was not far removed," which asked him whether he had reflected on the nature of omnipotence; whether he did not consider that the sinner was the only true reformer, and that the world being out of joint, adulterers, thieves, and murderers were born to set it right. These theories not being included in his University course, his Berserker blood at once resented them, and the phantom of the philosophic Mandeville was thrown overboard. Of course it was the Egyptian Manetho.

Balder then went in search of his uncle's house. His uncle was the antiquary of the prologue, who, being the son of an undertaker, had so long allowed his thoughts to dwell among tombs, mausoleums, and mummies, that he constructed for a human dwelling the gigantic sarcophagus in which his sister was married, and cut it off by a high wall from communication with the neighbouring city of New York, leaving no other means of subsistence for its inmates than the hoopoes, owls, crocodiles, and gold beetles which his gardens produced in abundance. Balder, having shaved his beard, and apparently lost therewith his superhuman strength, gained entrance by climbing a tree, and found himself among Moorish columns and Egyptian pilasters, in view of a conservatory where luxuriant shrubs with broad drooping leaves stood motionless in the heat, where palm-trees uplifted their heavy plumes forty feet aloft on slender stems, and where a crocodile lazily edged off a fragment of stone in the middle and plumped into the water. Here among the warm plants appeared to him a young woman, standing like the rejoicing upgush of a living fountain, "like the sphinx before the gloom of her riddle had dimmed her primal joy; like Isis in the first flush of her divinity." Her black hair was crowned with a low turban, round her brow was a band of jewelled gold, a golden serpent coiled round her smooth throat, her feet were sandalled, and from her shoulders fell a robe of purple byssus. Her name was Gnulemah. Manetho believed her to be Balder's sister, and now, having been picked up uninjured at sea, he returns to contrive their marriage. In the temple where their parents were married, and with the talismanic ring that united their parents, he joins the two together. But it appears that Gnulemah is his own daughter,

and that her mother is an old woman named Salome, who has long been her sole attendant. So the wedded pair are happy, until a lightning-flash bursts into their bridal chamber, killing Manetho, killing Salome, blinding Gnulemah, and converting Balder from the paths of sceptical enquiry.

The characters of this romance are wholly unreal. Manetho is the mediaeval devil with horns and a tail; Gnulemah is a chain-bound dweller in the Platonic cave of shadows; and the ideal Balder is a muddy-pated dreamer. More matter and less art are needed, both in style and in thought. The son of a man who "wrote excellent English—a language now obsolete," varies the style of a poet with that of a newspaper correspondent. His thoughts are as luxuriantly tumid as his father's were sternly chaste. And, to draw a final contrast, while Nathaniel Hawthorne devoted his literary life to the consecration of unselfishness, Mr. Julian Hawthorne creates an impossible form of self-idolatry, and executes poetic justice on it with a flash of lightning.

WALTER MACLEAN.

CURRENT LITERATURE.

MR. HOMERSHAM COX's answer to the question, *Is the Church of England Protestant?* (Longmans) is that the word Protestant is never used in the Prayer Book, the Articles, or the Homilies. He has no difficulty in showing that the English Reformation was conducted in independence of "German Lutheranism and French Calvinism," to the former of which alone the word Protestantism originally applied. Nor has he a hard task in quoting passages from the works of the early reformers which would be very unacceptable to the modern Evangelicals. Except, however, so far as this argument is directed against a real or supposed claim of the Evangelicals to thrust their opponents out of the Church, it is difficult to see what its value is. The sixteenth century is hardly capable of giving much direct teaching to the nineteenth. Then, as now, just as there are Aristotelians and Platonists in philosophy, there were two great divisions of religious men. There were the Reformers, who looked to church discipline and teaching, to study and cultivation of the intelligence, and to the influence of external rites as the means of reaching the individual soul, and who gradually abandoned certain doctrines and ceremonies without breaking loose from the system in which they had been educated. On the other hand, there were those who are popularly called Protestants, to whom, whatever their special doctrinal opinions may have been, the individual soul and its relation to God came first, and who cared little or nothing for external forms even if they did not reject them as Popish. Some such division as this runs through the history of the English Church. But in the sixteenth century these elements, if not likely completely to amalgamate, were at least tending to amalgamation. In our time they appear to be tending to fly apart.

The tendency to compromise which marked Queen Elizabeth's recension of the Prayer Book is one of the commonplaces of history. But this is not a point on which Mr. Cox cares to dwell. He quotes from Heylin to show (p. 21) that there was great care taken for expunging all such passages as might offend the "Popish party." But he does not tell us that care was taken to hold out a hand in the other direction as well. To inform us that "by the Queen's injunctions it was ordered that the Lord's Table should be placed where the altar stood," is to convey an erroneous impression. The table was merely to be placed

there when not used. At the time of Communion it was to be—

"placed in good sort within the chancel, as whereby the minister may be more conveniently heard of the communicants in his prayer and ministration, and the communicants also more conveniently and in more numbers communicate with the said minister; and after the communion done, from time to time the same holy table to be placed where it stood before."

This idea of a moveable table adopted by the Canons of 1604 is one which shows that the Elizabethan divines tried to satisfy the demand of others than "the Papist party." Is it possible that in this may be found the solution of that knotty point over which so many clergymen and lawyers have been puzzling themselves for so long. What if when the table was moved down it was placed east and west? Perhaps some one versed in the ecclesiastical literature of the sixteenth century can tell us if this is the case. It seems likely enough to have been so, and then the difficulty of reconciling the direction to the minister to stand before the table and also at the north side fades away at once.

Since the words just written were in type, Mr. William Milton, in a letter to the *Times* of Nov. 14, on Parliament and Convocation in 1661, has argued that, from the words of the rubric as interpreted by history, the east and west position at the time of the administration may safely be inferred. Williams's letter about the Grantham dispute, in 1627, though it does not touch the whole of the question, is at all events decisive as to what the practice of his day was not. "If you mean by altarwise," he writes, "that the table should stand along close by the wall . . . I do not believe that ever the communion tables were, otherwise than by casualty, so placed in country churches."

The real lesson to be derived from history is doubtless to be learnt from the seventeenth century, over which Mr. Cox passes so briefly. Then there was an attempt to enforce on the one side uniformity of doctrine, on the other side uniformity of ceremonial. At last it was found that men who held opinions so discordant could not dwell together in peace, and the Toleration Act authorised the separation of the combatants into distinct communities. In our days the corresponding solution for persistence in hostility between parties would doubtless be disestablishment.

Into Mr. Cox's criticisms on the Public Worship Regulation Act it would be out of place to enter here. But while he is certainly in the right in holding that no body of religious believers will ever be "put down" by Act of Parliament, it is to be doubted whether much light will be thrown on the subject unless it be admitted that his opponents have a *locus standi* both in the history of the English Church and in present possession, and that the fact that a patron may at any moment thrust upon a parish an incumbent whose thoughts and principles are radically different from those of the majority of the congregation is sufficient reason for the communion which we are witnessing, whatever opinion we may hold as to the special means which have been adopted to meet the difficulty.

The Ice-Maiden and other Stories. By Hans Christian Andersen. Translated from the Danish by Mrs. Bushby. (Griffith & Farren.) This gorgeous volume in scarlet and gold is a version of one of Andersen's latest *Eventyr*, the pathetic story of *Iisjomfruen*, or the "Ice-Maiden." It is a tale of one Rudy, a Swiss boy of Swedish extraction, whose mother, with him in her arms, had fallen into a crevasse between Grindelwald and the Gemmi, and been frozen to death before she could be saved. Little Rudy had been restored to life, but a change had passed over him; he had been kissed by the frosty lips of the Ice-Maiden, by which is meant the spirit of Alpine cold, and the spell of the snow always remained with him through life. The story is pure poetry, of the child-like and unalloyed kind, thoroughly ideal in spite of all the realistic touches, in which

H. C. Andersen specially delights. Rudy is taken to live with an uncle, who is a mighty chamois hunter in the Valais, and becomes a dauntless and adventurous climber; but the Ice-Maiden, and her attendants, Vertigo, Glamourie, and the rest, are always on the watch for him, but at first in vain. He grows up the handsomest and pluckiest lad in the village, and makes love to a dear little coquette called Babette; their small quarrels and adventures being recorded with all the delicious *naïveté* of Andersen. There are also a dog and two cats that play a prominent part. It is characteristic that the poet who of all others perceives least, or rather ignores most, what is merely animal in man, insists of all others most strongly upon what is human in the brutes. In the exquisite dream-world of Andersen, where men are children, and adult passions and sins are unknown, the cats and dogs are as shrewd as their masters, and often a great deal shrewder. The end of the story is very sad. On their wedding-day, Rudy and Babette row out in a boat to a little islet in the lake, and as they sit in the grass, with their feet dangling over the edge of the islet, and listen in a rapture to the lapping of the waters and the sound of the wind in the flowers, Rudy is seized with an irresistible attraction downwards. He glides into the cold dark waters, and Babette gazing after him in infinite terror, sees that as soon as the surface of the water closes over him, a crystal figure like a woman floats up, takes him in her arms and presses him wildly to her breast. This is the Ice-Maiden who has snatched him to herself at last, and poor little Babette has to mourn his loss to the end of her life.

To fill out the volume, the translator has added translations of three smaller stories, the "Butterfly," "Psyche," and "The Snail and the Rosebush." It is significant to any one who has read these tales first in their original language, to contrast the modest, paper-covered Danish duodecimos with the splendid English octavos, gilt-edged and gorgeous, that contain, after all, only the same russet and homely stories. At all events we do Andersen glory as far as in lies: it is to be hoped that these glittering editions bring him also some more tangible honorarium.

The Neglected Question. By B. Markewitch. Translated from the Russian by the Princesses Ouroussoff. 2 vols. (London: H. S. King & Co.) Russians are apt to complain that English books about Russia are incorrect and otherwise unsatisfactory. *The Neglected Question*, translated from the Russian by the Princesses Ouroussoff, must be assumed to be correct, so far as the pictures of Russian life are concerned, but in other respects it can scarcely be said to be satisfactory. The central figure is that of a lady of the type so familiar to French novelists. But her position is rendered peculiar by the fact that her conduct is closely watched by her son, a lad of fifteen, and by her husband, a forty-five year old paralytic. The situations to which this scrutiny gives rise are the reverse of comfortable, and in describing them the author, though actuated no doubt by the best motives, has brought before us pictures on which it is by no means an unmixed pleasure to gaze. The translators appear, so far as we are able to judge, to have done their work well. But their labour has been lavished, we fear, upon an ungrateful soil.

The Slang Dictionary, Etymological, Historical, and Anecdotal. A New Edition, revised and corrected, with many Additions. (Chatto & Windus.) We are glad to see the *Slang Dictionary* reprinted and enlarged. It would be shallow and perverse scholarship indeed that should not appreciate the importance of the language, or lingo, which it helps to place on record. Lurking in the lanes and byways are many words singularly instructive and interesting—words of a noble pedigree that have experienced strange reverses; words whose origin and history cast no faint light on the habits and tendencies of the popular mind;

words that have in their time served as the expressions of wild fashions and follies and frenzies. How imperfectly the ordinary lexicons represent the spoken language of the day! In whatever spirit such compilations as that before us were first published, whether Harman and Decker and Head and others, down to Grose and his followers, who attempted them, were moved by a desire to amuse or to edify, it is no trifling service to have a dialect reported and preserved, altogether unknown by Dr. Johnson and his successors, or altogether ignored. Certainly nothing that has ever circulated as an embodiment of human thought ought to be allowed to perish. We know too little about ourselves to spare a simple item that may assist us in any way, ever so slight, in the study of man. So that from a high scientific point of view this book is not to be despised. Of course it cannot fail to be amusing also. It contains the very vocabulary of unrestrained humour and oddity and grotesqueness. In a word, it provides valuable material both for the student of language and the student of human nature. We say material advisedly; for it cannot be said that much scholarship is exhibited in the volume as it now appears. The derivations, when any are given, are for the most part as ludicrous as anything in the book. The editor is evidently one of those who hold that etymologies are merely "happy thoughts;" whereas in that science "happy thoughts" are in the main quite "unhappy." Would that the ordinary word-collector would be content to tabulate, and not to derive! Of the merits of the tabulation in this case we need say the less because the book is not a new comer.

EDITOR.

NOTES AND NEWS.

WE are informed that Messrs. Bowes and Audsley's large forthcoming work on *Japanese Ceramic Art* is in active preparation, and the first part will probably be ready early in 1875. The plates are being printed in Paris in the highest style of chromolithography, and the work will be one of the most beautiful of its kind ever produced.

THE third volume of the *Monumenta Juridica*, edited by Sir Travers Twiss, under the direction of the Master of the Rolls, may be expected shortly to appear. It will contain the most ancient known text of "The Judgments of the Sea," extracted from the *Liber Horn*, and collated with the *Liber Memorandum* in the Guildhall of the City of London, and further collated with a Flemish MS. of the fourteenth century preserved in the Archives of the city of Bruges; also a very early Catalan text of "The Customs of the Sea," collated with the most ancient known MS. of the "Consolat del Mar," preserved in the Bibliothèque Nationale in Paris. Both of these collections of mediæval maritime law will be accompanied with English translations, it being the first time that an English translation of the "Consolat del Mar," although much called for, has been attempted. The Introduction to the work will give an account of the original "Black Book" of the Admiralty, which has been missing for some time, and has come to light since the publication of the first volume of the *Monumenta*, and likewise an account of the long-lost *Tabula Amalphitana*, reputed to be the most ancient collection of mediæval maritime law, which has been recently discovered among the Foscari MSS. in the Imperial Library in Vienna. Two photographic facsimiles of the text of the "Black Book" will be inserted in the volume, to enable palæographers to form an opinion as to the identity of the writing of the earlier and later parts of it.

OTHER volumes nearly ready in the same series are: the Rev. H. R. Luard's second volume of the *Chronica Majora* of Matthew Paris, and the Rev. J. R. Lumby's fifth volume of the *Polychronicon Ranulphi Higden*.

WE understand that Messrs. Henry S. King & Co. have in preparation a translation of the New Testament from the latest Greek text of Tischendorf, by the Rev. Samuel Davidson, D.D., LL.D. The work will contain an introduction embodying the ideas common to Dr. Davidson and Dr. Tischendorf.

A *History of Political Economy in Germany*, by the celebrated economist Wilhelm Roscher, Professor of Political Economy at Leipzig, has just been published at Munich by the Historical Commission of the Royal Bavarian Academy of Sciences. It is a most complete and erudite work, tracing the progress of economic ideas and philosophy in Germany from the time of Erasmus down to Hildebrand, Knies, Schaffle, Nasse, and other distinguished authors of the present day, and including a criticism of the doctrines of the principal English economists from Adam Smith to John Stuart Mill.

WE are glad to learn that Mr. W. B. Scott has at last decided to publish an edition of his collected poems. It will contain a great part of the *Poems by a Painter*, that beautiful and truly original volume that anticipated so much of the spirit of the best later poetry, and will include besides a cycle of esoteric sonnets entitled *Outside the Temple*, and a series of ballads. The book will be illustrated with a large number of etchings by the author and by Mr. Alma-Tadema, and its appearance will probably be one of the most important events of the present publishing season. It is being brought through the press by Messrs. Longmans and Co.

AN interesting manuscript poem on Bacon, being a warm defence of him by a contemporary admirer and friend, written apparently just at the time of his condemnation by the House of Lords, will be added to Mr. Morfill's forthcoming volume of Elizabethan political ballads for the Ballad Society.

MR. J. E. CORNISH, of Manchester, announces for publication a work entitled *Views of Old Manchester*. There are two series of prints, one by Ralston and the other by James, which represent the "Cotton metropolis" of fifty years ago; these have now become so scarce that the market value of a set in good condition is about 10*l.*, and even at that price a set is rarely met with. These views, with the addition of a few more from original drawings by Ralston, will be reproduced in phototype by Mr. A. Brothers. With very rare exceptions, the plates commemorate aspects of Manchester which have passed away never to return.

MESSRS. FARNCOMBE AND CO., of Lewes, announce that they have in the press a Dictionary of the Sussex Dialect by the Rev. W. D. Parish, Vicar of Selmeaton. It will contain upwards of 1,500 words, the use of which will be illustrated by examples from the proverbs, folk-lore, &c., of the country. Thus, under the word *bide*—which is of course known over all England—we have this "Sussex proverbial advice to a young mother:—

"If ye've got one you can run;
If ye've got two you may goo;
But if ye've got three,
You must *bide* where you be."

It is a pity this work has not been done in connexion with the English Dialect Society. The specimen sent out for subscription contains one great blunder. Shakspeare's "be-sted" is put down as the participle of the verb *best*, to get the best of.

SEÑOR JOSÉ M. PIERNAS Y HURTADO, Professor of Political Economy and Statistics in the University of Oviedo, has just published a study of Cervantes from a new point of view. His booklet is entitled *Ideas y Noticias económicas del Quijote*. It is somewhat novel to view the valorous Knight of La Mancha in the guise of a teacher of the "dismal science."

THE Early English Text Society has reprinted the first part of its prose romance of *Merlin*, from the unique manuscript in the University Library, Cambridge, under the editorship of Mr. H. B. Wheatley, but the part will not be issued till next January.

MR. F. W. COSENS is at work upon a Spanish *Henry VIII.*, to form one of his series of Spanish dramas illustrating Shakspeare's plays.

THE third part of the second edition of Professor Hertzberg's translation of Chaucer's *Canterbury Tales* is nearly ready.

WE have a very encouraging report of the number and zeal of the students of English at Strassburg. Professor Ten Brink is lecturing four times a week on English Grammar, twice a week on Milton's Life and Minor Poems, twice a week on Early English Texts, and twice a week on Corneille's *Cid*. His English lecturer, Mr. W. White, also has frequent classes in English conversation, composition, Tennyson's *In Memoriam*, &c.

PROFESSOR DELIUS's paper for the next Jahrbuch of the German Shakspeare Society establishes beyond reasonable doubt that the quarto and folio editions of *King Lear* are not, as was formerly considered, two originally distinct texts, but only two different representatives of the same text, so that the readings of the one may be rightly adopted in an edition of the text of the other.

PROFESSOR GUILLAUME GUIZOT, of the Collège de France, in Paris, has been elected a Vice-President of the New Shakspeare Society.

PROFESSOR W. D. WHITNEY, of Yale, has been elected an honorary member of the Philological Society.

THE *Times of India* says that a Parsee lady of Bombay has published a Guzerathi translation of Lord Chesterfield's letters.

THE first volume of Proudhon's correspondence is about to be published by Messrs. Lacroix. The *Temps* reminds us that Sainte-Beuve was the first to call attention to these letters, and to predict that they would be considered the most permanently valuable of the author's works. The whole correspondence will fill at least eight volumes; about 1,800 letters are now in the hands of the editors, and the supply is not yet exhausted. The present volume comprises the period from 1832 to 1842.

THE following Parliamentary papers have appeared during the week:—"Reports of the Inspecting Officers of the Board of Trade upon certain Railway Accidents during June and July, 1874" (price 9*d.*); "Army Medical Department Report for the year 1872" (price 6*s.*); "Legal Departments Commission—Second Report on Administrative Departments of the Courts of Justice" (price 1*s.* 8*d.*); "Turkey, No. 2 (1874)—Correspondence respecting the Ottoman Loans of 1858 and 1862" (price 1*s.* 3*d.*); "Statements and Abstracts of Reports deposited with and accepted by the Board of Trade, under 'The Life Assurance Companies Act, 1870'" (price 6*d.*); "Report of the French Conseil d'Amirauté on the Steering and Sailing Rules (or Rule of the Road at Sea), and other papers relating thereto" (price 8*d.*).

THE *Times* states on the authority of an American paper that the Historical Society of Pennsylvania has recently received from the Hon. Benjamin Rush an original baluster or newel-post from the stairway of the house formerly inhabited by John Milton. Accompanying it is a water-colour sketch of the building, with the following certificate from the hand of Jeremy Bentham:—

"Ao. 1821, August 15. Sketch of a house for some time inhabited by John Milton. It is situated in Westminster, in the street then called Petty France, but, on the occasion of the French Revolutionary War new named York Street, in horror of France, and honour of the Duke of York. This sketch was this

day taken from the garden attached to the residence of Jeremy Bentham, into which garden the house has a door, being, under the Dean and Chapter of Westminster, his property. From this house August 14, 1821, under the direction of the said Jeremy Bentham, was cut the balustrade pillar, composed of four twisted columns, presented by him, in company with this sketch, to his truly dear and highly respected friend Richard Rush, Envoy Extraordinary to the United Kingdom of Great Britain and Ireland.

"Witness my hand, JEREMY BENTHAM."

AT a meeting of ratepayers on the 24th inst., the parish of Islington, with over 200,000 inhabitants, declined to form a free public library and museum, to be paid for out of the rates under the Act of 1866. The adoption of the Act was moved by Professor Leone Levi, and seconded by Mr. Chatfield Clarke, of the London School Board; but after two hours' uproar, in which the voices of speakers for and against were pretty impartially drowned, the motion was rejected by 1,435 to 338. The war-cry of the opponents of public education and enlightenment was "No more rates!" and the result is a heavy blow to parochial government in London.

MR. THOMAS HOOD, who died on Friday week, in his thirty-ninth year, was the son of the famous humourist who wrote the "Song of the Shirt." Mr. Hood inherited his father's facility, both with pen and pencil, and had a share of his kindness, geniality, and gaiety. He made his first appearance in literature with the usual book of verses, and became more widely known as the writer of some stories for children. His novels are already entirely forgotten, and he will probably be best remembered as the editor of *Fun*. It must have required no slight administrative ability to secure the success of a cheap comic paper, and however little we may be amused by cheap comic wit, everyone must acknowledge that Mr. Hood's journal has not fallen below the standard of English respectability set by its elder and costlier rival. The number of *Fun* which appeared two days before his death contained marks of Mr. Hood's hand, and it is melancholy indeed to think of the "sick jester" trying to give a humorous account of the contents of the *Contemporary Review* for the month, and cut off in the season of the blossoming of comic annuals.

THE German papers publish large extracts from Professor Mommsen's speech, delivered by him as Rector of the Berlin University. It is chiefly concerned with the proper study of history, and tries to show that no one can be a good historian who is not first of all a good scholar and good jurist. He dissuades young students, while at University, from devoting themselves to special historical studies, and stands up for the purely propaedeutic character of all University teaching. His concluding words are:—

"You have in a German University what is wanted before all things, complete freedom of learning. No formal statute tells you how you are to employ your academic years; no intermediate examination enquires whether and how you have made use of them. No other nation places such confidence in its youth, and hitherto our academic youth has justified that confidence. Let each man then in future also follow his own way; and if the way sometimes leads into thickets or seems to be the wrong way, it has been found oftener than one could have hoped, that different ways lead to the same, and in the end to the right, goal. For every man of character his own way is the best, and that is open here to every one of you."

GREAT satisfaction is expressed in the scientific world of Berlin that the Imperial capital has won another of the brightest lights of the University of Heidelberg, through the acceptance by Professor A. Kirchhoff of the post of Director of the Observatory at Potsdam. This eminent physicist is the fourth of its leading University teachers that Heidelberg has had to resign in favour of Berlin within the last four years, Professors Helmholtz and Zeller having exchanged their former chairs in the Baden University for equivalent appoint-

ments in the Philosophical Faculty of the University of Berlin, while Dr. Kirchhoff's earlier colleague, Professor Hermann, has accepted the post of Councillor of the Highest Ecclesiastical Court of the Empire.

HISTORICAL students have long complained of the insecure state of our parish registers. Many have in former days been permitted to perish by damp and neglect, others have strayed away from their lawful keepers, and are now on the shelves of the British Museum and the Bodleian. Others are, it is to be feared, locked up in the libraries of those whom Anthony Wood calls "curious persons." The sale catalogue of the late Mr. John Gough Nichols's library furnishes an instance in point. Lot 336 is thus described:—

"Bedfordshire. Register Booke of all the Burialls in the Parish of Sittlington 1678-1754. Manuscript on vellum."

The same catalogue contains a manuscript life, which seems to be unprinted, of John Lord Belasyse. He was a noteworthy man on the King's side, in the great Civil War. A contemporary biography of him should contain some new facts as to the Northern campaigns.

WE know a good deal about the news-letters which circulated so freely some two centuries ago when newspapers were yet in their infancy, but little has come down about the journalists, if we may so call them, whose business it was to compile these useful materials for future historians. Among the State Papers is an account furnished by William Cotton (himself one of the tribe), when under examination, in October, 1683, of what he knew and believed "concerning those as are writers of news." He gives a somewhat curious catalogue of his colleagues. "Mr. Hancock" is one that has great intelligence both from court and council, on which account it is supposed that some considerable person furnishes him with "very private things;" he has a great number of customers, having been often seen to bring more than thirty letters to the post, from whom he gets considerable prices, some four, some five, some six, pounds a year; he was often heard to boast that it was worth from 100 to 150 pounds a year to him. A second writer, "Mr. Combes," had also great and private intelligence, whose letters were in great request in the country, as he wrote "in a good stile." A third, "Mr. Gay," who wrote only into the country, once "in vapor," said in Cotton's hearing, that he had 16*l.* or 20*l.* a year coming from one county alone. "Mr. Blackhall," on the other hand, served many coffeehouses in town, "Mr. Robinson" gives a good account of things, especially in term time, having been bred to the law. "Pike and Bill" are two that used to go partners in Parliament time, and served abundance of coffeehouses; notwithstanding the coffee men were commanded the previous summer to take in no more written news. Tom's Coffee House in Birch Lane, and several others, were still regularly supplied by this pair. Another variety in the journalist character, not perhaps even yet extinct, is found in "Mr. Claypole," who generally depended upon others for his news, taking no pains to get it, but would "word things well if not in drink." A coffee man in Newgate Street did a little business in the same way by subscribing to Hancock's and Robinson's letters, and manufacturing his own news out of a mixture of the two; three and sixpence a week was the price he paid for Hancock's letter. Cotton concludes his statement with an opinion that some clerks in the Post Office did greater strokes of business in the news-letter line than any of the people he had mentioned.

THE following fact is new, we believe, in the history of ancient forms of punishment, and we make it known the more readily, because the moral of it is equally applicable at the present time. On October 12, 1683, the grand jury of Middlesex made a "presentment" that they found

the many bills which came before them were for assaults and batteries and for the most part among poor people. These offences arose, moreover, from "scolding, backbiting, and reproaching one another," the prevention of which would tend to beget amity and kindness among neighbours, and save the money, which they spent at law, to clothe their families:—

"Wee therefore present as our opinions that the old legall way of a Ducking stole might prevent those quarilings. Shame may doe that which wee find other punishments will not—all which wee submit to this Honorable Court."

NOTES OF TRAVEL.

WE understand that it is probable that the route of the new Arctic Expedition about to be despatched by Government will be by way of Smith's Sound. Profiting by previous dearly-bought experience, the Expedition will sail later than previous Expeditions, and will thus give time for the ice to clear out of Baffin's Bay, instead of starting too early and having to battle uselessly for months against its outdrift in early summer. We hear that, as might have been expected, volunteers are very numerous; but great care will necessarily be taken to select both officers and men on the score of efficiency, health, and youth.

Now that it has been decided to organise another Arctic Expedition, we hope, in the interests of science, that a naturalist will be attached to the staff, for both the fauna and flora of the polar regions are but imperfectly known. We might say the same with regard to the survey of the Fiji Islands. It is true that the late Dr. Seemann published the botanical results of his visit to this interesting group, but his materials were exceedingly meagre and imperfect.

THE French Alpine Club held its first general meeting on the 19th of this month. M. Cézanne, its President, opened the sitting by an eulogium on M. Billy, his predecessor, who was killed by an accident on the railway only two days after his nomination. He then proceeded to state that the success of the "Club-Alpin Français," founded on April 2, 1874, has surpassed the most sanguine expectations. The Paris section alone already counted 320 members, and the numbers in the provinces were rapidly increasing. Three interesting papers were read. M. Gamard read an account of his ascent of the Jungfrau, in company with M^{me}. Gamard, who last year had ascended Mont Blanc; M. A. Mellot related his ascent, also with his wife, of the Cervin, that lady having twice made the ascent of Mont Blanc, and having this year scaled some of the most difficult peaks of Switzerland; and lastly, M. G. Devin read an account of his ascent of the Barre-des-Ecrins, the highest point of the Pelvoux group, and of his ascent of the Jungfrau and the Cervin.

THE *Journal de Genève* states that the waters of Lake Morat have latterly so diminished as to interrupt the steam navigation, and the same may be said with respect to other Swiss lakes, especially that of Sempach.

ACCORDING to the statement of the New York correspondent of the *Allgemeine Zeitung*, not less than 8,000,000 acres of wood are annually cleared in the United States, while not more than 10,000 acres are planted every year. It is estimated that Chicago alone consumes the produce of 10,000 acres, and in Wisconsin the yield of 50,000 acres is required to supply the wants of Nebraska and Kansas. Nor are these the only sources of drain, the produce of 12,000,000 acres of wood having been burnt down solely for the purpose of clearing the land.

THE Botanical Museum of the University of Christiania has received a large donation from Brazil, consisting of twenty-six packets with more than 1,000 species of dried South American

plants. The donor is the well-known Swedish botanist, Dr. Regnell, who has spent more than thirty years in Brazil, and who is a member of the Royal Swedish Academy of Sciences. He has had a botanical museum erected in Upsala, which is called after him, the Regnellianum, and is constantly making valuable presents to the learned societies of Norway and Sweden.

At last it would seem as if an opening had occurred for the development of the hidden wealth of the Chinese Empire. News has just been received that Li Hung-chang, Governor-General of Chihli (the metropolitan province)—who is probably the most powerful, and at the same time the most energetic, official in China—has resolved to take measures for working the coal and iron mines in his province; and that he has directed a well-known English resident at Tientsin, who is thoroughly acquainted with the mining capabilities of the district, "to proceed to Europe to procure the necessary staff and plant."

A SAN FRANCISCO letter in the *Augsburg Gazette* states that several experiments have been made there with an indigenous plant named *Rhamnus* or *Frangula californica*, the bean of which, when roasted and ground, is extremely like coffee. It is anticipated that the product is likely to become one of great importance. The same letter states that Southern California is now taking a prominent part in the example of industry set by the north. The milder climate is admirably suited for the culture of oranges, lemons, chestnuts, olives, cotton, sugar, and wine, and though the growing of these has commenced but recently, the yield is already sufficient for local purposes. Productive mines of gold, silver, tin, and mercury are also being worked, and naphtha springs exist in abundance. The chief industries in the north of the state are timber-felling and salmon-fishing. In consequence of a million salmon less than usual having been caught in 1873, the attention of the legislature was called to the matter, and a system of conservation is now in force. A company is also in existence with a monopoly in their hands for the trade in skins, a large kind of otter being the animal most sought after for this purpose. The same species frequents the Aleutian islands, Kamtschatka and Alaska, as well as the Japanese coasts, from which latter place, however, twenty enterprising Yankee vessels, in quest of furs and skins, have this year been turned away.

Now that the question of the endowment of research is being made so much a subject of discussion, it may interest our readers to learn the following particulars, which we take from the Swedish *Aftonbladet*. About a month since that newspaper drew attention to an appeal for funds made by the gifted botanist Dr. Berggren, who is at present exploring the fauna of the mountains of New Zealand. It appears that Dr. Berggren has already made some very valuable explorations, first in Spitzbergen in 1868, then in Greenland in 1870, and now has been sent out to New Zealand with a stipend drawn from a sum of money left by a Herr Letterstedt for scientific purposes. Dr. Berggren writes that he has had signal success, especially in discovering species closely analogous to the Arctic forms with which he is familiar, but that his means are at an end. An effort made to induce the Government of Canterbury Province to vote him a sum of money was on the point of succeeding, when an economical frenzy took the Lower Legislative House, and the bill was thrown out. *Aftonbladet* laid these facts before its readers. Almost immediately, the proprietors of another newspaper, *Göteborgs Post*, generously forwarded a large sum towards the prosecution of the work, and private funds came in so rapidly that Dr. Berggren will be able to recommence his valuable explorations directly the next mail reaches New Zealand. This zealous response to the demands of science in so poor a country as Sweden does honour to the intelligence of its people.

CORRESPONDENCE.

HERA BOOPIS AND ATHENE GLAUKOPIS.

In reply to Dr. Schliemann's letter in the ACADEMY (Nov. 21), I am not going to enter again on the question whether the splendid ruins which he has brought to light at Hissarlik should be called the ruins of Iliou or not. I know as yet of one Iliou only, that is, the Iliou as sung by Homer. That Iliou is not likely to be found in the trenches of Hissarlik, but rather among the Muses who dwell on Olympus, and who know all things, while we

ἡμεῖς δὲ κλέος οἶον ἀκούομεν, οὐδὲ τι ἴσμεν.

It would seem, in fact, that on that point Dr. Schliemann does not differ much from other scholars, who maintain that the Iliou of Homer never had any historical reality at all, and who look upon a so-called historical Iliou as a mere guess or a sentimental postulate. Dr. Schliemann asserts that the poet of our *Iliad* lived more than 1,000 years after the events which he describes in his poem, and that the ruins of Iliou lay 20 feet below the surface when Homer visited Beshika Bay. The poet of the Nibelunge lived about 700 years after Attila, and if Homer's Priam was as different from the supposed real Priam as Etzel or Atli is from the real Attila; or if no more historical reality is claimed for Achilles and *Troius* ἱερὸν πολιεῖσθαι than for Sigfried and Wormz and Santen, then no more words need be wasted on that question.

What I feel bound to do is to substantiate an assertion of mine, which I made at the meeting of the Society of Antiquaries in London, and which I thought required no proof, but which has been questioned by Dr. Schliemann, as well as by other archaeologists, viz. that the word *βοῶπις* means owl-eyed, and therefore historically, cow-eyed, and not cow-headed, quite as much as *γλαυκῶπις* meant owl-eyed, and not owl-headed. That

the cow was sacred to Hera, and the owl to Athena, has never been denied. But before the discovery of Dr. Schliemann's antiquities, no one, as far as I remember, doubted that *βοῶπις* and *γλαυκῶπις*, whatever their exact meaning might be, predicated something about the eyes, and not about the head; and to me, I confess, it seems as difficult to imagine that *βοῶπις* should ever have meant cow-headed, as that *αεγυς* should ever have meant one-headed, even if ever so many one-headed skeletons, statues, or urns should be dug up at Wantage. However, in spite of *γλαυκῶπις*, here is my proof.

Words ending in *ωψ*, *ωπος*, and *ωπις*, have three meanings. They refer, first of all, to the eyes; then to looks in general; lastly, like words ending in *ειδης*, to expression or likeness in general.

I. The meaning of *eyes* is clear in *μυριωπός* (Aesch.) with thousand eyes, the same as *μυριόφθαλμος* or *μυριόματος*. In Sanskrit, *sahasraksha*.

κατωπός, with downcast eyes.

μολύψ, blinking, short-sighted.

κοιλωπής, fem. *κοιλώπις*, hollow-eyed, like *κοιλόφθαλμος*.

πολυωπός, many-eyed.

The same word in the sense of "with many holes" (*ωπή*) comes from the same source; cf. *στενωπός*.

ἀστερωπός (*αἰθήρ*), star-eyed.

In all these cases the meaning of head, or even face, would be impossible.

II. We now come to compounds where *ωψ*, or *ωπος* or *ωπις* may be taken in the sense of eyes, but also in the larger meaning of *face* or *expression*.

ἀγριωπός, with wild eyes, or wild looking (*ῥμα*).

αιματώψ or *αιματωπός*, with bloody eyes, or bloody to behold; cf. *αιματώδης*.

γοργωπός, fierce-eyed; *γοργώπις*, Athena; cf. *γοργόφθαλμος*.

γαλεωπός, with cheerful eyes or countenance.

καλωπός, with beautiful eyes, or beautiful face, or beautiful in general.

μαρμαρωπός, with sparkling eyes; but *μαρμαρώπις*, turning to stone by a glance, like *λιθοερκής*.

III. Lastly, there are compounds where *ωψ*, *ωπος*, *ωπις* express *likeness* in general.

ἄβρηνωπός, manly-looking, manly, befitting a man. Possibly *ἀνθρωπός*, if for *ἀνδρῶπις*, though with anomalous accent.

ἀστερωπός, star-like, as joined with *ῥμα*.

δεινώψ, terrible-looking, terrible.

σκυθρωπός, angry-looking, angry; joined with *ῥμα* and *πρόσωπον*.

στυγερώπης and *στυγερωπός*, horrid looking, horrid.

τετρατωπός, strange-looking, marvellous; cf. *τερατώδης*.

μορμωρωπός, hideous-looking.

νυκτερωπός, night-like.

οἴνωψ, wine-like, deep-red, epithet of the sea in Homer, cf. *πορφύρεος*; afterwards in *οἴνωπός*, ruddy, jolly.

λιπαρώψ, bright-looking, *τράπεζα*.

πυρωπός, fiery-looking, fiery; applied to *κεραυνός* in Aeschylus; *πυρώδης*, applied to *ἀστερωπαί* in Aristophanes.

φαιδρωπός, bright-eyed, bright-looking, bright; *ῥμα*.

φλογωπός, fiery-looking; *πῦρ*.

παρθενωπός, of maiden looks, maiden-like, like *παρθενώδης*.

As the *ω* is long in all these compounds, we can hardly place *εἰρόσωπα* in the same class, but shall have to translate it "wide shouting," instead of wide seeing," *τηλωπός*. This is evidently the meaning assigned to the word by Pindar, in *χωρίς εἰρόσωπι κελύειον φεγγόμενος*. The only other word in which the *ο* is short is *χαωός*, bright-eyed, fierce-eyed, applied to lions, dogs, but also to the dawn, the moon, and the sea. The exact formation of this word is by no means clear. In Sanskrit *haryaksha* is used for "lion."

If after this we look at the words *γλαυκῶψ*, *γλαυκωπός*, *γλαυκώπις*, we shall not, I think, hesitate in translating them owl-eyed, and *βοῶπις*, cow-eyed, i. e., large-eyed; not either owl-headed or cow-headed. Words are older than any ruins,

In a few years we shall possess descriptive works on the vegetation of nearly all of our colonies and dependencies, written in English, and intelligible to any one who has mastered the contents of the most elementary of botanical class books, such as Oliver's *Lessons*. Complete Floras of New Zealand, Hong Kong, and the British West India Islands are in existence, so far as their vegetation is known. Six out of seven volumes on the vast and peculiar flora of Australia have appeared, two on the flora of tropical Africa, and three relating to that of the Cape Colonies. Mr. Bentham will doubtless soon complete his *Australian Flora*. The *Cape Flora* was one of the first commenced, but various circumstances have interfered with its progress, and it was for a long time after the death of Dr. Harvey at a standstill. It has now been taken up by Professor Thistelton Dyer. India, whose vegetable productions are of the utmost importance, is also without a general compendium, though this want will probably soon be supplied. The third part, completing the first volume of a comprehensive Flora of British India, edited by Dr. J. D. Hooker, will shortly appear. We understand it will include the rest of the *Thalamiflorae*. Another interesting addition to botanical literature may be expected in Mr. Baker's forthcoming work on the flora of Mauritius. It will include Rodrigues and the Seychelles. From the geographical position of the principal island, and the complete isolation of the smaller ones, we should look for some very distinctive features in the composition of the flora; but in this respect we are rather disappointed. In a measure it forms a connecting link between the vegetation of tropical Asia and tropical Africa, the species common to the latter country preponderating. The number of endemic species is not large, but there is a considerable number peculiar to the group, if we include Madagascar. The palms of Mauritius and the Seychelles are probably the most striking objects of the scenery. Most of the genera represented are restricted to these islands, and they are among the most majestic of a noble family. We need only mention *Verschaffeltia*, *Lodoicea*, *Phoenixophorum*, *Hyophorbe*, and *Lantania*. Flacourtiaceae are tolerably abundant, and represented by some exceedingly polymorphous species. One of the most remarkable elements in the flora is the tribe *Dombeyae* of the Sterculiaceae, the members of which all belong to the Old World, and most of them to the region extending from the island of St. Helena through Africa and Madagascar to Mauritius. A singular fact connected with this tribe is the small geographical area of most of its species. With the exception of a few scattered notes, and Bojer's *Hortus Mauritianus*, little has been published on the botany of Mauritius. Bojer's work appeared in 1837, and is little more than a catalogue, including moreover the exotic species cultivated in the island. All the new plants Bojer had detected are enumerated, but not described; and his intention to publish the descriptions in a supplement was never carried out, hence it is impossible to identify his names with the plants intended in the absence of authentic specimens, and it happens that many of them do not exist in the herbarium he left behind him. Actually, then, Mr. Baker has to define and describe the species bearing Bojer's names. The whole material available for the work is very scanty, and therefore the Flora will probably not be so exhaustive as could be desired, but it is a beginning.

Nature hears that Mr. Alexander Agassiz has just started on an expedition to South America, with the object of investigating the natural history of Lake Titicaca, and collecting antiquities from the surrounding country for the Peabody Museum.

and owl-headed vessels, even if 1,000 years older than Homer, are modern things compared with Greek words. Without wishing to detract one tithe from the credit justly due to Dr. Schliemann, it may be well to remind archaeologists that the oldest antiquities of Greece are the words of the Greek languages, particularly those which are *pre-Hellenic*, i.e., shared in common by the principal members of the Aryan family, and that a true etymology which brings us face to face with the first building up of a Greek name, brings us to strata of history, far beyond the reach of any shafts sunk at Hissarlik or Bunarbashi.

MAX MÜLLER.

THE BHARHUT SCULPTURES.

58 Clarendon Gardens : Nov. 23, 1874.

I am glad that Dr. Max Müller has drawn attention to the text of the Bharhut inscriptions, and I think it is clear that in some instances General Cunningham's readings require revision. Thus, at p. 111 of the Proceedings we have a yaksha whose name is read as Suviloma, a word which occurs neither in Sanskrit nor in Pali; but if we alter it to Suchiloma, we obtain a proper name well known in Sanskrit literature, and which, moreover, belongs to a yaksha mentioned in the Buddhist scriptures. In Sir M. Coomara Swamy's newly-published *Sutta Nipāta*, an important contribution to Buddhist literature, will be found (p. 75) the translation of a sūtra which takes its name from the yaksha Suchiloma, to whom, in answer to a question, Gautama Buddha recites three religious verses. Though it is not so stated, we may fairly conclude that the yaksha became a convert to Buddhism, and thus obtained a niche in the Bharhut temple of fame.

Again, at p. 115 General Cunningham reads an inscription as *Erapāto nāgarāja Bhagavato vandate*, and translates it "Erapātra the Nāga Rāja worships Buddha." This rendering is quite inadmissible, first because *Bhagavato* is a genitive, while *vandati* governs an accusative; and, secondly, because the Bo tree which the Nāga king is worshipping can by no possibility be called Bhagavat, which is the usual designation of a Buddha. All becomes easy if we supply the word *bodhim*, which has doubtless either become effaced or escaped General Cunningham's notice, and read *Bhagavato bodhim vandati*, "worships the Buddha's Bo tree." I have before me a photograph of this bas-relief. It is executed with great spirit, and is of singular interest, as it gives us what is probably a faithful representation of the famous tree at Buddhagaya, an off-shoot of which still flourishes in Ceylon.

I must say that I do not share Dr. Max Müller's scepticism with regard to the important Jetavana inscription. With two or three trifling emendations it reads as follows:—*Jetavanam Anāthapindiko deti kotisanthatena ketā*. "Anāthapindika presents Jetavana, having become its purchaser for a layer of kotis." I have not the photograph before me, but I suppose it represents both scenes, the purchase of the ground and the gift of the monastery. The only serious difficulty of the inscription is the presence of the letter *e* in the second word. But it is clear that in these inscriptions the symbols for *e* and *i* are not sufficiently distinguished, since General Cunningham in each case reads *vandate* (which is neither Sanskrit nor Pali) for *vandati*; and at p. 113 he has Vijayata for Vejayanta, the well-known palace of the Buddhist archangel Sakka. He also reads *Kupiro* (*Kubiro*) for *Kubero*. I, therefore, feel little hesitation in amending *-pediko* to *-pidiko*. The missing *n* is easily restored when we observe how frequently, in the case of a conjunct consonant, one letter of the group is made to do duty for both—e.g., Kasapa for Kassapa, Vejayata for Vejayanta, Kakusadha for Kakusandha. *Ketā* is the correct Pali form of the Sanskrit *kretā*, "purchaser." *Santhata* (*samstrita*) occurs pretty frequently in Pali with the meaning "strewn, spread," and there is no reason why the neuter should not be

used as a synonym of *santhara* (*samstara*). The latter word is often used in the sense of "layer, stratum" (see, for instance, Mahavamsa, p. 169, *phalikkasanthara*, "a layer of quartz stones"). *Kotisanthatena ketā* would then mean "purchaser for a layer of kotis," and this exactly tallies with the Buddhist narrative, which states that Anāthapindika spread the whole area of the garden with a layer of coins, amounting to 18 kotis, which he handed over to Jeta as the purchase-money (Hardy's *Manual of Buddhism*, p. 219). *Koti* in Pali is sometimes used absolutely for a large sum of money (ten million kahāpanas).

It is impossible to read General Cunningham's most interesting account of these sculptures without a sigh of regret that they should be so far beyond the reach of our inspection. I hear of a proposal to remove them from Bharhut. The scheme carries with it a certain aroma of vandalism (fancy carting away Stonehenge!); but if it should be carried out, is it too much to hope that the sculptures may find their way to the India Office, instead of being consigned to the peaceful oblivion of an Indian museum? R. C. CHILDERS.

SPENSERIANA.

1 Oppidians Road, Primrose Hill, N.W.

The important discovery as to the poet Spenser's place of education, made known in the Fourth Report of the Royal Commission on Historical Manuscripts, and reported in the ACADEMY for July 4 of this year, makes it probable, though not certain, that Spenser was not only born (see the *Prothalamion*) but bred in London; and so perhaps what I ventured to suggest as to the scene of his early life in the *Memoir* prefixed to the Globe Edition of his works, published in 1869, may require some modification (see p. xviii. of the Globe Spenser), though not necessarily so, if we remember that town and country were not so utterly divorced in the Elizabethan age as now a days. What God made, and what man made, as Cowper has it, were not so utterly put asunder but that a man might enjoy both without performing an amazing pedestrian feat. East Smithfield itself was not wholly unrural then. The fields actually touched it; and the houses did not crowd densely together to make its name a dismal misnomer.

With regard to his connexion with the Merchant Taylors' School, it may, perhaps, be worth noticing that Spenser's choice of St. Barnabas' day for his wedding may indicate a kindly remembrance of his old school life; for that is the great election day at the Merchant Taylors' (Murray's *Handbook of Modern London*). See the *Epithalamion*, the song devoted to the celebration of his own matrimonial bliss:—

"Ring ye the bells, ye yong men of the towne,
And leave your wonted labors for this day.
This day is holy; doo ye write it downe,
That ye for ever it remember may.
This day the sunne is in his chiefest hight,
With Barnaby the bright,
From whence declining daily by degrees,
He somewhat loseth of his heat and light.
When once the Crab behind his back he sees."

Also, may it not now be possible to discover who "Wrenock" is, mentioned in the *Shepherds Calendar*, December? Certainly, lines 37-42 seem to refer to his school days, as what follows to his University career, when he became acquainted with Gabriel Harvey:—

"And for I was in thilke some looser yeares
(Whether the Muse so wrought me from my
lyrth,
Or I to much beleered my shepherd peeres),
Somedele ybent to song and musicks mirth,
A good olde Shephearde, Wrenock was his
name,
Made me by arte more cunning in the same."

Whether Spenser had visited the North before he went up to Cambridge, or not, the old belief as to his visiting it after he left the University, remains undisturbed. (See *Glosses* to

Shep. Cal., June). Plausible reasons, as is well known, have been alleged for supposing that the particular part of the North visited was in the neighbourhood of Burnley in East Lancashire (see the *Gentleman's Magazine* for August, 1842). Probably to those reasons something might be added by a careful study of the language of the *Shepherd's Calendar*. It is to be hoped that Mr. T. T. Wilkinson, who in 1867 read an interesting paper on this subject before the Historic Society of Lancashire and Cheshire, will be encouraged to undertake a more minute investigation. Many of the words he quotes in his list of 1867 are of too general occurrence to be of value in localising the poem; such words, for instance, as *kirk*, *gate* (a road), *wood* (mad), *latch*, *gar* (compel), &c., &c.; and of no word is it shown that it is distinctively East Lancashire. I will only add on this point that, if Spenser passed all his youth in the South country, it is not likely that he writes with complete accuracy the dialect he attempts. His Old English is notoriously faulty; and so probably is the language of his Bucolics. A Greek brought up at Athens would be liable to trip in his Doric, if he took to writing in the manner of Theokritos when some six Olympiads old.

Mr. F. C. Spenser of Halifax, who first suggested that the neighbourhood of Burnley was the cradle of the poet's race, was of opinion that Hurstwood was the chief seat of the family, but that the branch to which the author of the *Faerie Queene* immediately belonged, was settled on a little property still called "The Spensers," near Filly Close, two or three miles to the north of Burnley. Such was his theory; but his practice seems to have been scarcely consistent with it. For he took up his quarters in a house not near Filly Close, but at Hurstwood, and has given currency to a tradition that it was there the poet's own people lived. And the house is now becoming known as "the poet's house," and people travel from far to see it. And no doubt soon, if only the soil and climate allow, a mulberry tree planted by Spenser will be pointed out; for, according to the popular fancy, planting mulberry trees was the chief avocation of our great poets. The house is not the principal one in the hamlet—not Hurstwood itself, for that was built for "Barnardus Townley et Agnes uxor ejus," as an inscription over the door sets forth; but a house of smaller dimensions, some few yards to the west of the abode of the Townleys. As the tradition of its being the poet's is now, as I have said, prevailing, and is sure in a few years to be quoted by some biographer as evidence on the question, I wish here to record that it is, in fact, of altogether modern growth. In a recent visit to Hurstwood, a friend and I tried to discover the time of its origin, and found that beyond all question it dates from Mr. F. C. Spenser's visit a generation ago. We interviewed the three oldest inhabitants we could hear of—they were all said to be eighty-four—that seems the fashionable age with the ancients of Hurstwood—and could find no trace of the Spenser legend in the memories of their earlier life. But our most decisive witness was the present tenant of the house in question, a thoroughly intelligent and clear-headed man, whose father lived there before him. He remembered Mr. F. C. Spenser's visit, and was quite positive that it was during that visit his father and he first heard of the honour their mansion might boast. Such traditions so easily take root. I remember once being assured at Middlewich, in Cheshire, by a man who looked incalculably old, that in the house where he dwelt, John Milton, the poet, "came a-courting." It was an old lath-and-plaster house, inscribed with the names of Edward and Prudence Minshall, and of Hyvonn and Marie and John Minshall; and from this inscription had sprung the story. Some one with a little learning, with enough learning to know that Milton's third wife was named Minshall, but not enough to know that she hailed from Nantwich or thereabouts, had leapt to a wrong conclusion; and the popular mind, regard-

ing a formal "courting" as a necessary preliminary to a marriage, had added a detail of its own, and brought the then blind and feeble poet down in person into Cheshire a-wooing. In this case also the author of the legend might, I believe, be satisfactorily discovered. Hurstwood is only some three or four miles from Filly Close, so that it may be described as in Spenser's country, and, as the chief seat of his family, be believed to have been often visited by him; but there seems no reason for identifying it with his own home.

The great natural feature of the district is Pendle Hill. Both at Hurstwood and at Filly Close it is lord of all. Filly Close, indeed, stands in the "forest" on the south-eastern descent. One interest attaching to this mountain that recalls the poetry of Spenser is that it was the great gathering-place of witches—"the great locale," saith Murray, "of the saturnalia of Lancashire witches"—the Brocken of Old England. Several hundreds of these poor creatures were brought to trial and burnt in the early years of the seventeenth century. His native country may well have furnished Spenser with some hints for the pictures he draws of such beings. The original of the following sketch may have been some actual scene in Pendle Forest:—

"There in a gloomy hollow glen she [Florimel] found

A little cottage, built of stickes and reedes
In homely wize and wald with sods around;
In which a witch did well, in loathly weedes
And wilfull want, all careless of her needes;
So choosing solitarie to abide
Far from all neighbours that her divelish deedes
And hellish arts from people she might hide,
And hurt far off unknowne whom ever she envide."

Fairie Queene, III., vii. 6.

And there are other passages of a like origin possibly. Duessa herself may have been a Lancashire witch to begin with.

That Rosalind was a Lancashire witch in the modern sense, there can be little doubt. Helps towards her identification are that she was "the widdowes daughter of the glenne;" that the poet first met her in some "neighbour town;" that her name "Rosalinde" is "a feigned name, which, being well ordered, will bewray the very name of hys love and mistress whom by that name he colourth;" (See *Shep. Cal.*, *April* and *Januarie*, and the *Glosses*.) Suppose her Christian name to be Elisa, could the name of Nord, or any other combination of the four remaining letters, be found in any local register or document? Then perhaps we might discover who was the happy Menalcas who supplanted the poet. (See *Argument* to *Shep. Cal.*, *June*.) Perhaps she was wise in her generation; for Spenser, late of Pembroke, Cambridge, must have cut a poor figure in those days of his life, waiting wearily for something to turn up, with nothing that could be called his own save a few manuscripts, which I dare say Miss Rosalind could not read. Those who think she was a sister of Daniel the poet must ignore the evidence that connects her with the North Country, for the Daniels were of Somersetshire. One may plausibly believe that "the neighbour town" was Burnley; for he does not use "town" here in the old sense—in the sense, for instance, of Chaucer's *Prologue*, l. 478 ("a pore Persoun of a toum")—but evidently he is thinking of Vergil's "urbs" in the *Eclagues*, as i. 20 and 34, viii. 68, &c.; and the "to see" is significant.

"A thousand sithes I curse that careful lower
Wherein I longed the neighbour towne to see,
And eke tenne thousand sithes I blesse the stowre
Wherein I sawe so fayre a sight as shee;
Yet all for naught; such sight hath bred my lane.
Ah God! that love should breede both joy and payne."

However these things may be, it is certain that he was deeply smitten with her beauty. Fifteen years afterwards the vision of her still haunted him. It was with him in his castle of Kilcolman,

and his heart was as tender towards her as ever, so that he would not hear a word said in her disparagement (see the conclusion of *Colin Clouts come home again*).

The Registers of St. Peter's, Burnley, abound under all the three heads, in entries relating to Spensers. The only one that, in the course of a hasty examination, struck us of possibly immediate importance to the poet, was that of the burial of an Edmund Spenser, November 9, 1577—an entry seemingly overlooked by Mr. F. C. Spenser, if Craik reports him accurately in his *Spenser and his Poetry*, i. 12, ed. 1845. If this was the poet's father, how well it would agree with the poet being then in the North, and also with his leaving it so soon after.

J. W. HALES.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, NOV. 28,	3 p.m.	Crystal Palace Concert (Handel's <i>L'Allegro</i>).
	"	Saturday Popular Concert (St. James's Hall).
	3.45 p.m.	Royal Botanic.
	8 p.m.	Royal Albert Hall—Popular Night (Sims Reeves).
MONDAY, NOV. 30,	4 p.m.	Royal: Anniversary.
	7 p.m.	Actuaries.
	8 p.m.	British Architects. Medical.
	"	Monday Popular Concert (St. James's Hall)—last time of Billow.
TUESDAY, DEC. 1,	2 p.m.	Royal Albert Hall—Ballad Night.
	7 p.m.	Horticultural.
	7 p.m.	Sculptors of England.
	8 p.m.	Civil Engineers. Pathological.
	"	Royal Albert Hall—English Night (Barnett's P.F. Concerto).
	8.30 p.m.	Zoological.
	"	Biblical Archaeology: M. Naville on "A Mythological Inscription in the Tomb of Seti I.;" Dr. Birch on "The Inscription of Harhemhebi in the Turin Museum."
WEDNESDAY, DEC. 2,	1 p.m.	Sale by Messrs. Puttick and Simpson of the Library of the late Bryan Walter Proctor, Esq.
	8 p.m.	Microscopical. Geological. Pharmaceutical. Obstetrical.
	"	Society of Arts.
	"	Royal Albert Hall—Beethoven Night (Billow).
THURSDAY, DEC. 3,	8 p.m.	Chemical. Linnean.
	"	Inventors' Institute.
	"	Royal Albert Hall (<i>Elijah</i>).
	8.30 p.m.	Antiquaries.
FRIDAY, DEC. 4,	1 p.m.	Sale by Messrs. Sotheby and Co. of the Library of the late J. G. Nichols, Esq.
	4 p.m.	Archaeological Institute.
	8 p.m.	Geologists' Association.
	"	Philological: Mr. J. F. Stanford on "Foreign Words imported without change into English."
	"	Royal Albert Hall—Schumann's Concerto, Selection, Tannhäuser.

SCIENCE.

Alpine Plants: Figures and Descriptions of some of the most striking and beautiful of the Alpine Flowers. Edited by David Wooster, F.R.H.S. Second Series. (London: George Bell & Sons, 1874.)

THE fact that this volume has been preceded by a similar one is, no doubt, to some extent a proof that books of this kind meet with the approval of a sufficiently large public. They cannot, therefore, be judged by an absolute standard, and the criticisms which they suggest must be borne both by those who buy as well as by those who produce them. Perhaps the worst that is to be said is that notwithstanding the fact stated on the title-page that the editor is assistant-secretary to the Royal Commission on Scientific Instruction, the present work is quite destitute of any scientific value. It is free

from any conspicuous blunders, but the text is written entirely from an amateur point of view, and cannot be looked upon in any way as authoritative. Moggridge's *Flora of Mentone* is a good instance of the undoubted feasibility of, at any rate in this matter, making the best of both worlds. Its thoroughly competent execution makes it useful to the professed botanist, while what may be called its decorative aspect is not in the least curtailed. The fact is that it is impossible not to regret that the expenditure of energy and capital which books like Mr. Wooster's must needs require does not result in a higher standard being reached. Very little more thought and labour might make a work of this kind a thing of some permanent value, instead of a merely ephemeral ornament to the drawing-room table.

Taking the book on its merits, a good deal must be said in favour of the fifty-four coloured plates. The illustrations, of course, often suffer from the flatness and hardness inseparable from the mechanical processes of chromo-lithography. But the drawing frequently shows a great deal of genuine appreciation of what one may call the sentiment of plant form. The least successful plates are those on which figures of more than one species are given. The specimens drawn are often badly juxtaposed as regards effect of colour and scrappy in dimensions. A great deal of the beauty of a small plant arises from the feeling of "composition" which it suggests, taken as a whole. If a "top" of a flowering shoot is figured, there is a painful sense of its being suspended in space without a *raison d'être*. The whole thing looks as unhappy as an architectural detail in a textbook. A much more satisfactory result would have been attained in every way by associating on the same plate different species of the same genus.

Turning over the plates, even the unbotanical reader will feel, without quite knowing how to explain it, a sense of incongruity. This detects Mr. Wooster in what is perhaps the most serious fault to be found with him—that of including amongst his alpine plants a great number that are not alpine at all. Differing as widely as alpine plants do from one another, they are all tuned as it were to the same key, and if anyone will look at plate xxxix., where Mr. Wooster has quietly figured a pretty bulb from the dry plains of the Cape side by side with a genuine alpine saxifrage, it will be pretty evident what a manifest thing a floral discord really is. In point of fact, Mr. Wooster's Alps include any spot of the earth's surface between the equator and the poles, the sea-level and the snow-line—anywhere indeed where plants of herbaceous habit and conspicuous flowers find themselves at home. Thus he gives us the South American genera *Nierembergia* and *Calandrinia*, *Saponaria oeymoides* and *Astragalus monspessulanus* from the south of Europe, and *Scilla sibirica* which—its name notwithstanding—is a native of Persia and Asia Minor. But the boldest demand Mr. Wooster has made on the ignorance of his readers is in the case of one of the most successful of his plates—that of the curious *Trichinum Manglesii* from the Swan River. He is candid enough to speak of this as a greenhouse plant; but if we

could really bring home to such consciousness as the plant may possess the place Mr. Wooster thinks it best fitted for in nature, we should certainly soon possess a pale-flowered variety. It is quite as surprising, to anyone who knows the Thames-side meadows about Oxford, to come on *Fritillaria Meleagris* (badly figured from an abnormal specimen) amongst a supposed alpine flora. W. T. THISELTON DYER.

RECENT CONTRIBUTIONS TO BASQUE PHILOLOGY.

Remarques sur les Noms de Lieux du Pays Basque. Par M. Luchaire. (Pau: Vignancourt, 1874.)

La Question Ibérienne. Par Julien Vinson. (Paris: Maisonneuve, 1874.)

La Langue Ibérienne et la Langue Basque. Par M. W. van Eys. ("Revue de Linguistique." Juillet, 1874.)

THE first two works on our list are "extrait des *Mémoires du Congrès Scientifique de France, Session de 1873, à Pau*." That by M. Luchaire is, perhaps, the earliest attempt at a rigorously scientific explanation of local suffixes in Basque. The various changes of these local names are first considered, and the most ancient forms established. Then the local suffixes are examined in order, according as they begin with a vowel, or with a labial, palatal, sibilant, nasal, or vibrant consonant. The author lays down five rules or qualifications as necessary to the work:—(1) To possess at least an elementary knowledge of Basque grammar and phonetic laws; (2) To compare the modern Basque name with the most ancient form preserved; (3) To compare the nomenclature of the French and Spanish Basque countries; (4) To propose only evident etymologies, or those suggested by the physical character of the localities; (5) To observe the laws of common sense in these interpretations. In addition to these we would suggest a sixth; viz., to compare these suffixes with those of other languages besides the French. We suggest this last rule, because it is impossible not to remark how much the poverty of the French language in local terminology has hampered the author in his work. Thus, we have upwards of twenty of these suffixes translated "lieu de." This robs the essay of a great deal of the picturesque descriptive grace that might have enlivened it, and makes it far more dreary reading than it might otherwise have been. We will give a few examples to show our meaning. The suffix "Egui," or "hegui," we are told signifies "bord, extrémité d'une chose, lisière d'un bois, côté d'une montagne." Yet "Hegui-courria" is translated "la montagne blanche," "Hegui-luce," "montagne longue." "Montagne" is far too general a term; surely something like "crest, ridge, head, cap, peak, side, or end," would be better. So "Oyer-egui," "lieu du bois," might be wood-end or woodside. "Biscarr-egui," "lieu de la colline," "Hill-side." The particular epithet would, of course, be determined by an application of rule four to the physical features of the spot. So with the popular suffix "eta" in Spanish, "ette" in French Basque, like our Hollies, Elms,

Ferns, etc., we feel confident that an examination of the locality would in all cases show some reason for this plural suffix in words like "Subi-çabal-eta," translated "lieu du grand pont"—it may perhaps refer to an unusual number of arches; in "zubi-eta," "lieu du pont," perhaps to a succession of bridges destroyed either by war or flood, as has been so often the case in the Basque countries. Thus, too, some of the many suffixes signifying "abundance," if conjoined with names of trees, might be translated Oak-hill, Beech-vale, Birch-moor, Ashfield, according to the locality, instead of "lieu planté d'ifs," etc., and other names like our Fullford, Richmond, etc. On p. 24, "tari," "tra," "dun," are well translated by the French "eux," "euse," as in "pierreux, -euse," like our own "Stony Stratford." We do not at all wish by the above remarks to depreciate the more valuable and thoroughly scientific method followed by M. Luchaire of treating these suffixes according to their phonetic values; but only to suggest that by studying the physical features of each spot, and by carrying his analysis farther, he may arrive at still more satisfactory results. The present essay shows how capable he is of doing this, and we prefer, therefore, to look on it as a tentative and not a final one.

In general, M. Luchaire is scrupulous in giving full reference to his authorities; but by some accident none is given to the *Dictionnaire Topographique du Département des Basses-Pyrénées*, par M. Paul Raymond—a work which is indispensable to the student of Basque toponymy, and without which M. Luchaire's mémoire could hardly have been accomplished. We mention this, because the work is absolutely necessary to all who may wish either to control the present investigations, or to pursue them farther.

The other two essays on our list are alike in showing a growing tendency, lately revived by M. Bladé in his *Etudes sur l'Origine des Basques*, to dispute the conclusions of W. von Humboldt in his *Prüfung der Untersuchungen über die Urbewohner Hispaniens* (Berlin, 1821). M. van Eys attacks Humboldt's hypothesis more boldly; M. Vinson, with more reserve. It seems to us that a great deal of the opposition to Humboldt's conclusions arises from not observing the difference of the conditions of two very different problems. The problem which Humboldt, following Larramendi, Astarloa, Erro, and others, set himself to solve is, What is the original language of certain names in Spain, which we find in a Greek and Latin dress in classical itineraries, geographers, historians? The other problem is, What is the language of the so-called Iberian or Celtiberian inscriptions and numismatic legends? These two questions, it seems to us, are often confounded, as if they must stand or fall together; whereas they are wholly distinct. The question we have to ask ourselves in solving the one is, How would a Greek or Latin author probably have written such and such a Basque word? In the second case, "Do these characters represent the Basque language in its original alphabet?" In the first case it is sufficient that the word in the Itineraries should accord with Greek or Latin phonetic laws in its supposed trans-

scription; it is by no means necessary that, in its foreign dress, it should exactly follow in every letter. Basque phonetic laws. In the second case, the words, if Basque, must necessarily follow the laws of Basque phonetics.

1. To give a few examples of our meaning: "Iri-berri" in modern Basque is clearly, Newtown; or rather, "Ville-neuve." How would Ptolemy, Pliny, Mela, and Strabo probably have written this word had they met with it; bearing in mind that the three last complain of the difficulty of representing Basque names in Greek and Latin? (Mela *de Situ Orbis*, lib. iii. cap. 1; Strabo iii. 3; Pliny i. xi. and xiv.). We find the names of two towns written respectively, Illiberis (Ἰλλίβερρις, Ptol.; Illiberi, Pliny), and Illiberis or Illiberis (Ἰλλίβερρις). Are these possible or probable representations of the Basque word? On this M. van Eys observes, p. 7: "Il est vrai que l'est quelquefois pour r; mais *ili* ne se trouve jamais, autant que nous sachions, pour *iri*." Perhaps not in Basque phonetics, but that is not the question, but whether Greek or Latin authors would have represented the Basque Iri by the Greek and Latin Ἰλλι, Ἰλι, Illi, and have written "Illiberis," etc., for "Iri-berri"?

Humboldt remarks on the names of many rivers, and towns near streams, or near the sea, compounded with "Ur," water. "Ur," generally appearing as "Ur," but sometimes, according to Humboldt, as "ul," like "ili" for "iri." On this Van Eys: "Humboldt veut identifier 'ula' avec 'ura,' eau. 'Ur,' eau, ne se rencontre jamais comme 'ul.' Dans les composés le r se perd toujours." The first of these assertions may be true in Basque; but not necessarily so in a Greek or Latin transcription. The last must be a slip. It is better in his Dictionary, *sub voce* "Ur," p. 356: "Dans les noms composés le r se perd presque toujours." But even this is hardly correct in toponymy. In the Pays Basque there are at least a dozen streams, besides other names, beginning with Ur, e.g. twice Ur-haudia, Deep-water, and at least four in Guipuzcoa, with probably proportionally as many more in the other provinces. So that Humboldt was fully warranted in considering the many names of streams in Spain beginning with "Ur," as *primâ facie* Basque. Again, take a common word like "Mendi-gorria," Red-hill. How would this be represented in Greek, remembering that in Basque the syllable "gor" is short, and the stress of the voice falls on the "i" in "ia"; "gorri," too, in the Latin charters is often written "gur," e.g., Baigorri is thrice written with "gur," in 980, 1168, and 1186 A.D.? We find a town named Mendiculeia among the Ilergetes, and again in Lusitania; for the last the MSS. of Ptolemy give two readings, Μενδικουλία and Μενδικουρία, with the same change as above of r into l. If an examination of the sites of either of these towns should discover a "red-hill," we should feel much inclined to accept this as a transcription of the Basque word. So, to deal with suffixes, the Spanish Basque "agn," or French "ague," might surely be represented by the Latin "aca." Take the word Olabiaga (Biscay), Orabiague (Labourd). O and U are constantly inter-

changed, not only in the different modern dialects, but also in the Latin charters in the same word: thus we find *Ordios* written four times *Urdios* in the charters, and only once *Ordios*. May not then *Olabiaga* and *Ora-biague* be fairly represented in classical Latin by *Urbiaca*, a town in the *Tarraconensis*? In the same way, we think the common termination "itz" (in the charters "iz") may be expressed in classical Latin by "issa"—e. g., *Iturissa*, *Carissa*—the last in *Baetica*, where the modern Spanish "*Carixa*" seems to recall the still more ancient name. Space warns us to close our citations, which we give as examples only. Humboldt's lists could be much extended now that our materials for the study of the Basque language and toponymy are so greatly augmented. We have, it seems to us, no right to expect a much greater amount of literal accuracy in the Greek and Latin transcription of Basque names than we find in French, German, and English transcription of Oriental names. Even a word like *Punjab*, of whose meaning there is no doubt, is written *Punjab*, *Pendjab*, and *Pandschab*, in English, French, and German atlases, besides innumerable variations. We have no more right to demand an explanation of *all* these ancient local names than we have to demand an explanation of *all* modern Basque names. It is in trying to do with these ancient names what cannot be done with modern Basque that Humboldt has gone astray, but not so far as to affect his main argument. As M. Vinson so well observes in page 10 of his Essay:—

"Il se trouve que, précisément, l'explication des noms de lieux est ce qu'il y a de plus difficile en basque moderne, où beaucoup d'entr'eux, qui échappent à l'analyse, sont relativement très-anciens et représentent un état de l'euscarien sensiblement différent de l'état actuel."

2. The second problem is quite different from this. The so-called Iberian inscriptions are supposed to be written in characters which represent the sounds of the Basque language more closely than any modern alphabet, and consequently should exactly follow the phonetic system of the *Escuara*. Here we agree with MM. Vinson and Van Eys that no interpretation of these inscriptions, either by Boudard, Saulcy, Phillips, or Heiss, to say nothing of earlier attempts, has yet proved either that the alphabet has been rightly read, or that the language is ancient Basque. This last hypothesis, which is generally taken for granted, has yet to be proved.

A cursory examination of the works of Heiss, Boudard, and others, and a comparison of the inscriptions with the *Karian* alphabet, and also with one entitled "*Letras Góticas Runas*," traces of which seem to be found in Spanish MS. orthography as late as the eleventh century (cf. *Ortografía de la Lengua Castellana* of the Spanish Academy; various edit., Madrid, 1784-1808), has led us to conjecture whether there be not more than one alphabet (of which that of the *Castellon* inscription is the oldest) on these coins and inscriptions, or, if only one, whether it be not in a state of progressive degradation till finally lost by a process of mixture and absorption with the ordinary Roman alphabet. If our conjecture be right,

the mode of interpretation would then be to work upwards from the latest MSS. and inscriptions in which these characters are found mingled with the ordinary ones. The value of the letters thus mixed is generally apparent. Dare we warn investigators not to be too eager in translating the numismatic legends thus read? These would probably be names of places or persons, and how many of such are of most doubtful interpretation, even in Modern Basque, we have remarked above; rather let them first study the affixes and suffixes, and phonetic laws of these inscriptions, and be content to interpret afterwards.

We have little space for the thoughtful and philosophic essay of M. Vinson. Its conclusions are mainly negative, but are hardly less valuable on that account. He shows that although the Basque is clearly to be classed among agglutinative languages (p. 5), no close connexion with any one such language has yet been established (p. 6.) He does not even think any answer possible in the present state of Basque studies to the question whether Basques and Iberians are the same people, or Basque and Iberian the same language (p. 13).

This hesitation in one of the most scientific and best-informed of Basque scholars may astonish some of our readers; but we believe this reticence to be fully warranted. Only, as we have tried to show above, the facts to which Humboldt called the attention of European scholars do not depend on the identification of Basque with Iberian either in language or ethnology. They may be, if supplemented, a step towards it, but the method of proof is entirely independent. Whatever language the so-called Iberian inscriptions may turn out to be, that fact would not disprove the presence of Basque local names, still capable of identification under a Greek and Latin dress, in parts of Spain and Southern France, whence this people has long since been driven or withdrawn.

Besides the essay of M. Van Eys treated of above, the *Revue de Linguistique* for July contains a paper by Dr. E. Martin, in which he endeavours to form a correct estimate of the scientific value of Chinese philosophy and discovery. The next most important articles are two by M. Vinson: one, on the word "*Tamoul*;" the other, a review of Van Eys' *Dictionnaire Basque-Français*.

WENTWORTH WEBSTER.

NOTES AND NEWS.

Function of the Optic Thalami.—Professor Nothnagel, of Freyburg, in a recent number of the *Centralblatt*, states as the result of a large number of experiments he has performed upon rabbits—1. That the optic thalami have nothing to do with the nerves destined to produce voluntary movements. 2. That no disturbance of the sensitiveness of the skin can be demonstrated after their extirpation. 3. They appear to have a definite relation to the muscular sense.

Elastic Tissue in the Bones.—At a late meeting of the Société de Biologie, reported in the *Gazette Médicale de Paris*, Nov. 7, 1874, M. Renault read a paper on this subject in which he stated that if a longitudinal section be made of the tibia of a bird, and the section be treated with absolute alcohol, then with picric acid to decalcify it, and be finally coloured with picrocarminate of ammonia,

a good idea will be obtained of the special structure this bone presents. It may then be seen that it is composed of two parts: the first, internal, is formed of trabeculae, the general direction of which is given by the system of arciform fibres proceeding from the periosteum, and which forms the entire bone in the embryo; the second, external, is only represented in the embryo by the periosteum itself, and in the adult consists of longitudinal fibres parallel to one another. These fibres are composed of modified connective tissue, they form nearly the whole outer part of the bone, and becoming attenuated group themselves longitudinally around the Haversian canals. These are the fibres of Sharpey. Among these fibres are others consisting of long and very delicate highly refractile filaments, staining bright yellow with picric acid, and resisting the action of caustic soda and potash at 105° Fahr. In transverse sections they occupy the external part of the bone which M. Renault proposes to name the *étui fibre-élastique*, and do not penetrate into the spongy portion. Every section of a fibre of Sharpey in the outer portion of this zone is surrounded by a number of small glittering points, each of which represents the section of an elastic fibre.

The Means of distinguishing Real from Apparent Death.—A memoir has just been published by M. le Dr. Ange-Monteverdi on a simple, easy, prompt, and certain method of distinguishing real from apparent death. The point is not always quite so easy to determine as might at first sight appear, and there have been various well-authenticated instances of premature burial. The plan suggested by Dr. Monteverdi consists in the subcutaneous injection of a small quantity of liquor ammoniac—the strength of which should be considerable (sp. gr. 0.92). When injected into the living body, even during the last hours of life, ammonia causes the appearance of a spot of a deep red or purple colour which forms more or less quickly according to the rapidity of the circulation. If the fluid be injected after death, no change in the colour, or only a darkening of the natural colour of the skin, is produced. If injected into a person in perfect health, a severe burning pain is experienced, and a small blister rises in the centre of the spot. No harm beyond the formation of a small eschar appears to result from the injection, and all traces vanish in the course of a fortnight. M. Monteverdi appends six coloured oleographs, which exhibit very clearly the different effects produced by the injection, twelve, ten, five, &c., hours before death, and shortly after death. It seems to be a sign which, being founded on a physiological basis, may be fairly trusted, and might prove serviceable in a doubtful case.

Spontaneous Combustion.—At the *séance* of the Société de Chirurgie de Paris (October 21, 1874) a paper by M. Chassaignol, of Brest, was read on this subject. The question of spontaneous combustion was broached for the first time in 1692, and various French authors have accepted it as a possibility. The Germans, however, as Casper and others, have denied it. M. de Chassaignol has attempted a careful revision of all the cases recorded, and finds that no medical man nor any one whose statements are worthy of credit has ever observed the phenomenon at first hand. Many authors declare that the human body burns with a blue flame and the production of an empyreumatic odour, and it has been imagined that the alcohol with which the tissues of drunkards are saturated might catch fire: but facts are stubborn things; the flesh of drunkards does not appear to be more inflammable than others after death, and even when it has been soaked for several days in alcohol it burns with difficulty. Again, after injection made into the veins of animals, as of dogs, it was found impossible to effect their combustion. Others have suggested that inflammable gases might be generated, but this also is unproved, and, on the whole, M. de Chassaignol decides against the possibility of its occurrence.

Colouring Matter of the Blood.—At the *séance* of the Académie des Sciences de Paris (Oct. 19, 1874), a paper by MM. Paquelin and Jolly was read in regard to the composition of the blood corpuscles, in which the authors believe they have established the following points:—1. That the iron of the blood corpuscles exists in the state of the tribasic phosphate of the peroxide. 2. That haematosine does not contain iron, as has been already stated by M. Chevreul; it is to be noted, however, that the composition of this colouring material differs according to the nature of the solvent used for its extraction, and that it has probably not hitherto been obtained in a state of purity. MM. Paquelin and Jolly have arrived at the conclusion that haematosine contains no iron, from the circumstance that the blood corpuscles submitted to maceration in alcohol rendered alkaline by ammonia, and submitted to a series of filtrations and distillations, furnish an impure haematosine, which becomes less and less rich in iron with each operation, containing after four such proceedings scarcely a trace of the metal.

Cause of the Change of Colour of the Chameleon.—At the last meeting of the Société de Biologie de Paris (October 14, 1874), M. Paul Bert read a paper on the cause and mechanism of the change of colour in the chameleon. The natural or ordinary colour of this saurian is deep bottle-green, which changes to bright green, and then to bright yellow. The cause is to be sought in the nervous system. If the sciatic nerve be divided on the left side, the leg on this side assumes its deepest and most sombre green hue, whilst that of the opposite leg brightens. The nerves implicated in this change descend directly from the encephalon, and follow the same course as the motor nerves. For if the chameleon be poisoned with woorara it becomes black, and if it be chloroformed it becomes bright; and if pushing the experiment farther it be killed with chloroform, it becomes again black. On removing the two halves of the encephalon, leaving the nucleus, it changes colour and becomes black. If one hemisphere be left, one side remains bright whilst the other darkens. There are, consequently, nerves which may be termed "colouring," springing from the nucleus of the encephalon, the action of which is restrained or inhibited by the two hemispheres, and which give more or less vividness to the tints displayed by the animal. The mechanism of these changes has been explained by MM. Edwards and Pouchet. Under the skin are vesicles filled with pigment, which give off processes that interlace in all directions. At the will of the animal the pigment is collected in the vesicles, and the colour of the skin then brightens; when the pigment becomes redistributed in the network, the colour darkens. M. Paul Bert has remarked that light excites the colouration of the chameleon. If the animal be surprised in sleep, the side exposed to light is bright; that turned away from the light is dark. This curious state remains as long as the animal sleeps, but disappears on waking, the skin then becoming everywhere bright.

The Star Cluster in Sobieski's Shield.—In the years 1869 and 1870 Professor Helmholtz, at the Hamburg Observatory, determined the positions of some two hundred stars belonging to the cluster in Sobieski's Shield. This cluster, which was discovered by Kirch in 1681, was carefully observed by Dr. Lamont at Munich between 1836 and 1839, and the places of about 150 stars in its most condensed part were then fixed with considerable accuracy for comparison with subsequent observations. These Professor Helmholtz has now made after the lapse of more than thirty years, so that if any change has occurred, and especially if there has been any condensation going on, it ought to be clearly shown by comparing the two sets of measures. The two series, however, agree so closely, that the second set may be looked upon simply as a verification of the first—a result which, though disappointing with respect to the

object in view, must yet be gratifying to both the observers concerned, as evidence of the accuracy of the measures. Two charts present at a glance the results of the two determinations, the only noticeable difference being that Professor Helmholtz has included many more outlying stars in his area of operations.

Sun Spots.—Dr. Rudolf Wolf, of Zürich, has published No. xxxvi. of his *Astronomische Mittheilungen*, devoted entirely to the subject of sun spots. Besides a discussion of the numbers of sun spots observed in 1873, of which a record was obtained on 363 days out of the 365, by his own observations, supplemented by a few at other places, and of the magnetic declination and its disturbances at Christiania, Munich, and Prague, as dependent on sun-spots, there is given a sort of *catalogue raisonné* of the literature of this subject, in which we find an abstract made by Mr. Ranyard of Pastorff's celebrated observations from 1819 to 1833, the MS. of which was presented by Sir John Herschel to the Royal Astronomical Society.

A New Table of Logarithms to Twelve Places.—A valuable present has been made to the Royal Astronomical Society, in the shape of a MS. table of logarithms of numbers to twelve places of decimals, of which Mr. J. W. L. Glaisher gives an account in the *Monthly Notices*. These tables, it appears, were computed by Mr. Thomson, an accountant of Greenock, in his intervals of leisure, and are a rare monument of persevering industry. Their great merit consists in their having apparently been calculated throughout in entire independence of the results of previous computers, so that they furnish a most valuable check on the earlier tables, some errors in which have been detected by a comparison with them. The labour required for this work must have been very great, there being only two tables of equal extent in existence, the *Tables du Cadastre* and Mr. Sang's tables, and these, it is to be remarked, are only in MS. and not generally accessible. It is to be regretted that the expense of printing such a work, coupled with the limited demand, should prevent its publication, and it seems hardly too much to hope that Government may some day be induced to grant the moderate sum required for a table of ten-figure logarithms, which is now most urgently wanted, and which would, in Mr. Glaisher's opinion, satisfy the wants of the present generation. The use made of such tables is not to be measured on commercial principles by the number of copies required, but rather by the number of times those copies are used and by the results which are obtained by their means.

Observations of the Comet of 1862.—After a delay of more than ten years, caused by the difficulty of reproducing faithfully the original drawings, Professor Schiaparelli has published the results of the careful observations which he made at Milan on the comet of 1862. This comet, coming after our brilliant visitors of 1858 and 1861, excited but little attention, though it deserved notice from the fact of its having (in all probability) given rise to the August meteors (the Perseids), which move in the same orbit, besides being remarkable for several peculiarities which serve to throw much light on the constitution of comets and the development of their tails. In researches which gained him the medal of the Royal Astronomical Society, Professor Schiaparelli has already shown the connexion which exists between certain comets (including that of 1862) and certain star-showers; in the present memoir he discusses the phenomena presented by the comet of 1862, and draws important conclusions as to the forces which gave rise to them.

After giving the observed positions of the comet, Professor Schiaparelli discusses the changes in apparent brightness of the head, from July 24, when it was fainter than a sixth magnitude star, till it became brighter than a star of the second magnitude on August 31 (being very similar in

this respect to the late comet). From these observations the intrinsic brightness is deduced by means of the usual law that the apparent brightness is equal to the intrinsic brightness divided by the product of the squares of the distances of the comet from the earth and sun, a formula which assumes that the comet's light is derived from the sun, whether directly by reflection or indirectly by conversion of solar radiant energy (in the form of heat, light, or actinism) into luminous vibrations. Though this law will be modified if the proportion of the whole energy of the solar radiations received by the comet which is converted into the luminous form is not the same at different times, yet Professor Schiaparelli seems to limit it too much when he confines it to cases where all the light is derived from simple reflection. In the comet of 1862, the intrinsic brightness found in this way increased to five times its original value in about five weeks, but in an irregular manner, remaining stationary for some ten days after the first ten days' increase, an operation which was repeated in the succeeding twenty days.

The apparent diameter of the head is so dependent on the state of the air that the concluded changes of real size may perhaps be accounted for in this way; but there can be no doubt that the nucleus decreased greatly in brightness as the comet approached the sun, and as its diameter when nearest did not exceed 350 miles, that of the head being 250,000 miles, its density must, Professor Schiaparelli considers, have then been considerable, seeing that from it alone must come both the coma and tail in all subsequent apparitions of the comet. But the distinctive feature of this comet was its lopsided character, and this appears to account for many abnormal appearances remarked by all observers. Supposing the tail to be vertical with the head above, the left-hand side was the more developed and the appearance something that of a stick with a knob on one side. The luminous jets which are emitted from time to time by the nucleus, and afterwards form the tail, were all on the left, a secondary tail was thrown out on the same side at an angle of 60° with the principal tail, and making a considerable angle with the plane of the orbit, for it so happened that we passed through this plane on August 10, only a few days after the last appearance of the tail in question. This circumstance by enabling us to view the comet from above and below the plane of its orbit, has proved very useful in deciding several doubtful points about the directions in space of the various tails with which this comet appears to have been well equipped. And this is a point of great importance, for contrary to nearly all precedent, the principal tail was, on issuing from the head, inclined considerably to the direction opposite to the sun, though eventually becoming parallel to it, so that the particles appeared to describe parabolas, having the head as vertex and this direction as axis, just as we should expect them to do under the combined effect of a lateral explosion and a repulsive force from the sun, the motion being nearly similar to that of a projectile on the earth. The question arises then whether the lateral deviation is in the plane of the orbit, the only plane in which a resisting medium could produce any effect. Professor Schiaparelli decides this in the negative as the angular deviation remained nearly constant instead of changing as we passed through the plane of the orbit. A resisting medium being thus out of the question, he concludes the cause to be an explosive force from the nucleus, which maintains a constant, or nearly constant, position in space (during the period of observation, from August 17 to 31), either from want of rotatory motion or from the action of a polar force directed to the sun. But the author seems to have overlooked the ordinary case of constant direction in the solar system, rotation about an axis which always remains parallel to itself, whilst fixity of direction in either of the cases he supposes is hardly conceivable.

But besides the impulse from the nucleus and the repulsive force from the sun, the particles of the tail seem to have been under the influence of their mutual repulsions, for not only did the tails spread out (which might be accounted for by the sun's action), but the anterior boundary curved forwards till it actually cut the prolongation of the radius vector, which is of course the axis of the parabolas above mentioned. This is a fact of great importance which seems never to have been remarked before, and in conjunction with the inclination of the tail to the plane of the orbit will render this comet memorable for the light it has thrown on the constitution of these bodies.

WE have to welcome the appearance of a new philological journal, the *Revue de Philologie et d'Ethnographie*, the first volume of which has just been published at Paris under the editorship of M. de Ujfalvy, and a number of other well-known savans. The articles contained in this its first number augur well for its success and usefulness. M. de Charencey on the "Symbolism of the Hindu Points of Space" is followed by a paper by M. L. Adam on "A Vogul Genesis," important to others besides philologists and theologians. The barbarous tribe of the Vogulians in Eastern Russia has preserved ancient myths which demand special attention at the present time, when Turanian mythology is beginning to be examined. They are embodied in four independent poems collected by Reguly, and published in Magyar by Hunfalvy in 1864. The first text describes the creation by *Numi tãrom*, the supreme god, who loosened the winds, and so raised the waves of the abyss above which hung in a silver basket a demi-god and his wife. The wife, in union with the air, gave birth to Elempi, and this semi-divine being, with the help of *Numi tãrom*, dragged up the dry earth from the bottom of the abyss, made it firm with a chain of silver, and fabricated men, animals, and birds out of clay and snow. Then came the invention of bows, arrows, and clothes of skin, and the institution of marriage, in consequence of which men began to multiply so fast, that death had to be sent as a corrective. The second text presupposes the existence of giants before the creation of mankind. There were two classes of these, one of them called "sons of God," and they frequently fought with one another; but both had been created by *Numi tãrom* without the intervention of the demiurge Elempi, and neither had any wives. The third text gives a history of magic, which was first discovered by the giants, and the polymorphous creatures described in it remind us of the monsters of early Babylonian legend. The fourth poem treats of the Deluge, which happened after seven years of drought, and lasted for seven days (like the flood of the Chaldeans). Those only were saved who had attended to the advice of "the great woman" and "the great man," and built boats furnished with a sufficiently long cable. The third paper is a valuable investigation of letter-shifting in the Ugric languages, by M. de Ujfalvy; then come African vocabularies by M. Halévy; "Some Remarks on the Japanese Theatre," by M. Polday, in which it is pointed out that the Japanese drama is confined entirely to the lower classes, and is deficient in ideality and the sentiment of affection; and notes on the description of Russia found in the travels of Sigismund von Herberstein (born 1486), by M. de Ujfalvy. M. Emile Soldi contributes an article on "Modelling in Plaster in Antiquity and at the Renaissance;" and after an introduction to American bibliography by M. Wiener, the journal concludes with a valuable review of Donner's *Comparative Dictionary of the Finnic Languages*.

WE quote from the *Nation* the following summary of the proceedings at the meeting of the Oriental Society, held in New York at the end of October:—

"One of the most elaborate and interesting of the papers presented was a review and criticism of the progress of decipherment of the Cypriote inscriptions,

with original additions, by Mr. J. H. Hall. The latest and best German investigator in this field, Moritz Schmidt, laments that he has not in trustworthy form the material from the Di Cesnola collections; this Mr. Hall has undertaken to furnish him. Professor Short, of Columbia College, while praising highly Roby's *Latin Grammar*, thought it weaker in syntax than elsewhere, and criticised and amended certain syntactical points. Mr. Tyler, of the Astor Library, called attention to phrases in the Thebaic dialect of Egyptian which have hitherto escaped notice. Dr. Ward exhibited an Assyrian seal-cylinder and gave a brief exposition of it. Mr. Merrill, of Andover, sent a long and full article on the Assyrian monuments in this country. The new and attractive subject of Japanese was represented by two papers—one by Professor Griffis, recently returned from a residence of some years in Japan, and one by Mr. Van Name, of the Yale College library. Mr. Griffis discussed the recent revolutions in Japan, and the causes for them to be found in the modern literature of the country. Mr. Van Name treated of the distinction of noun and verb in the Japanese language, showing that, as in other languages of a low order of structure, it was hardly if at all recognisable. Professor Adler, of Ithaca, lectured the Society on the importance of Talmudic study to the early history of Christianity, and pointed out references which he thought he had discovered in the Talmud to the Christian sect and its doctrines. Professor Whitney, of Yale, defended the ordinarily accepted views of Sanskrit accent against the objections brought up by Dr. Haug, of Munich, in a recent elaborate paper. Professor Haldeman, of Philadelphia, had a brief note upon the occurrence of certain Semitic sounds in American languages. The closing communication, by Mr. J. Hammond Trumbull, of Hartford, was on recent German discussions of the evidence of Phœnician colonisation in America, and led to a lively and amusing debate."

MEETINGS OF SOCIETIES.

CAMBRIDGE PHILOLOGICAL SOCIETY (Thursday, Nov. 12).

PROFESSOR COWELL was unanimously re-elected President of the Society for the next year. Mr. Wratislaw read a paper in illustration of the following passages: Horace ii. *Sat.* i. 86; Euripides *Med.* 297, 377, and 1052; Æschylus *Eumen.* 581, 638, and 639; Thucyd. iv. 18 (4), 28 (1); vi. 11 (6); and vi. 16 (2); and Ephesians vi. 2.

LINNEAN SOCIETY (Thursday, Nov. 19).

DR. G. J. ALLMAN, F.R.S., President, in the Chair. Mr. D. Hanbury exhibited dried specimens of a rose raised from seed received direct from the country where the attar of roses is produced, as the species from which this perfume is obtained. Mr. Baker pronounced it to be *Rosa gallica*, var. *damascena*, the monthly rose, belonging to the Centifolia group, thus confirming previous conjectures on this point. It appears that several varieties are cultivated for this purpose. The President read a paper on the structure of *Stephanoscyphus mirabilis*, the type of a new order of Hydrozoa. The animal is a remarkable organism which occurs imbedded in sponges on the southern shores of France. It forms composite colonies which have a general resemblance to a campanularian hydroid with its cup-like hydrothecae, or so-called polype-cells, opening on the surface of the sponge, and, when the animal extends itself, giving exit to a beautiful crown of tentacles. It has, however, though a true Hydrozoon, no immediate relation with the Campanularians, or with any other hitherto recognised order of Hydrozoa; for the hydrothecae-like receptacles are occupied, not by a hydranth or polypite, but by a body which has all the essential characters of a Medusa; and the tentacles, which are displayed when the animal extends itself, are really the marginal tentacles of a Medusa. It is further provided with the radiating and circular canals of a true Medusa. The animal is essentially a composite colony of medusiform zooids included in a system of chitinous tubes, from which, like a

campanularian hydroid, each zooid has the power of extending itself, and within which it can again retreat. The author regards the *Stephanoscyphus mirabilis* as the type of a new order of Hydrozoa, to which he assigns the name of Thecomedusae. He regards *Stephanoscyphus* as affording a convincing proof of the homology on which he had formerly insisted in paralleling the tentacles of a hydranth with the radiating canals of a Medusa. Dr. M. T. Masters then read a "Monograph of the Durioneae." The paper contains an enumeration of the genera and species of the tribe, together with descriptions of the new species found by Beccari in Borneo, &c. It is accompanied by some remarks on the morphology and geographical distribution of the group. In both respects the group is very distinct. The peculiar scaly pubescence, the compound stamens, the (in some cases) very peculiar anthers, and the muricate fruits, all constitute remarkable features. The question of "divided" or "compound" stamens, which has of late been re-discussed by Chatin, is alluded to with the result that the author adheres to his previously expressed views on the subject—views, moreover, supported by those of Payer, Sachs, Baillon, Van Tieghem, and others. The nature of the petals in Malvales in general is also touched on. Sometimes these appear to be autonomous organs, while in other cases they seem to form part and parcel of the staminal phalanges.

PHILOLOGICAL SOCIETY (Friday, Nov. 20).

REV. DR. RICHARD MORRIS, President, in the Chair. Professor W. D. Whitney was elected an honorary member of the Society. Dr. B. Mangold, Mr. W. R. Morfill, Mr. J. H. Lloyd, Mr. J. H. Hessels, and Prof. Hy. Attwell, were elected members. Mr. C. B. Cayley read a paper on "Certain Italian Diminutives," in which he endeavoured to point out a link between the Italian use of the termination *ino* to form diminutives of nouns, and the Latin use of *inus* in adjectives denoting general relations. He referred to the derivative proper names in *inus*, which abounded under the Emperors, and especially in and after the fourth century, serving occasionally for patronymics, as in the cases of Carinus, Constantine, &c., and he suggested that *Paolino* came thus to mean a child of Paul, and then a little Paul. In this way the Italian diminutives *carino*, *lupicino*, or *sacchino* seem to be anticipated by the proper names Carinus, Lupicinus, Ursicinus. He added that the high-toned vowel *i* has a certain aptness to suggest childish or female voices, which, though not by itself accounting for the significance of *ino*, might contribute to make it generally preferred to *iano*, and other common terminations of derivative proper names for the purpose of forming diminutives.

M. Gaidoz, editor of the *Revue Celtique*, communicated a paper on the name *Holy Island*, said to have been anciently given to Ireland. After remarking that Ireland was so called by but one writer, Avienus (in the eleventh century), and that the description of its inhabitants given by Strabo was far from entitling it to the appellation, the writer came to the conclusion that the name was the result of "popular etymology." The ancient Greek names for Ireland are *Ἰερώνη* and *Ἰερὴ νῆσος*, and the passage from either of these to *Ἰερὴ νῆσος* is so easy as to make M. Gaidoz's ingenious conjecture very probable. He then examined Dr. Stokes's etymology of *Erin*, the *Ἰερὴ* of the Greeks, rejecting all others proposed as too improbable to require detailed notice. Dr. Stokes thinks the oldest form of the stem was *Everion* or *Iverion*, which he connects with the Sanskrit *avara*, "further, western," so that *Erin* would be "the land or isle of the west." M. Gaidoz pointed out that this name could not have been given by the Irish to their own country, but must have been learnt from strangers; a conclusion which exactly fits in with the probability of the early voyagers having obtained the name of the "Western isle," from the inhabitants of

Britain, and with the fact that the natives of Ireland did not call themselves by a name derived from *Erin* till comparatively recent times.

PHYSICAL SOCIETY.—(Saturday, November 21.)

DR. J. H. GLADSTONE, F.R.S., in the Chair. Professor H. M'Leod described and exhibited a modified galvanic battery, whose internal resistance could be readily varied in a known ratio, for the purpose of illustrating to a class the effect of such variations on the strength of current. Each cell consisted of a long glass tube containing a solution of chloride of zinc, with a platinum wire covered with chloride of silver inserted at the bottom to serve as the negative plate, and a circular disc of zinc, of nearly the same diameter as the inside of the tube, which could be raised or lowered by an insulated wire attached to it, as positive plate.

Mr. Baillie Hamilton followed, on the application of wind to stringed instruments. He described an attempt to excite stringed instruments by blowing instead of scraping or twitching the strings, which was made several years ago by Mr. Farmer, music master at Harrow School. His method consisted in flattening one end of the string, and placing it in a slit so as to form a sort of reed, which, when blown on, set the rest of the string vibrating. The effect, however, was very unsatisfactory for several reasons. Mr. Hamilton, who had since investigated the matter, found that if a reed were attached by means of a metal pin to some part of the length of a string fixed at both ends as usual, the reed and string would accommodate themselves to each other and vibrate together, the string separating into two unequal segments; the segment connected with the reed being always shorter than the other or reinforcing segment. This last, indeed, takes the place of the column of air in an organ pipe. Some strings so mounted were sounded by wind, and gave a very good tone, closely resembling that of an organ pipe.

Mr. Hamilton considers that he has thus combined all the advantages of stringed instruments with all the advantages of reed instruments, and has obtained thereby a very perfect and pure source of sound. The compass he has already secured is about seven octaves. The excursions of the reed are so restrained by its connexion with the string that it produces no perceptible harshness. Any difficulty there may be about delay in speaking, can be got over by percussion as usual; but the author finds that an elastic band stretched across the nodal points of the whole set of strings not only steadies them, but transmits a thrill from any one in vibration to the rest, just sufficient to make them respond immediately when a key is depressed.

In order to avoid the usual defect of strings, viz., their liability to go out of tune, Mr. Hamilton flattens the part of the wire beyond the bridge and coils it into a light spiral; this entirely prevents changes of pitch as the string expands, and indeed renders very considerable rotation of the tuning-pin necessary in tuning them. His bass strings consist entirely of these flattened coiled wires; a very great length of wire being thus comprised within a comparatively short length, the tones of a grand piano can be obtained with a very moderate length of soundboard. Some such coiled strings were struck and gave wonderfully fine bass notes.

ROYAL GEOGRAPHICAL SOCIETY (Monday, November 23, 1874.)

At the meeting of the above Society, the President, Sir Henry Rawlinson, announced the accession of sixty new members, being the largest addition which had taken place since the foundation of the society. Sir Henry then mentioned that since the last meeting Her Majesty's Government had sanctioned the cost of an Arctic expedition, that Sir Leopold McClintock had

inspected some suitable vessels at Dundee, Aberdeen and Peterhead, and that there was every probability that the necessary arrangements would be completed in time for the expedition to start in May next.

Sir Rutherford Alcock alluded to the possible importance of the expedition in regard to science, and said that it was not easy to say what discoveries it might not lead to, just as no one could have predicted from Galvani's first experiments in electricity that they would be the forerunner of the telegraph wires and cables. He begged to move that the society offer its congratulations to the President on the success which attended his labours towards this most desirable end.

Sir Henry Rawlinson in reply, begged that he might be allowed to share any credit with Sir Bartle Frere. Proceeding to the business of the evening, Sir Henry then said that news had been received from Colonel Gordon, who, on September 5, was at Gondokoro, with the sections of his steamer below the falls. It might thus be anticipated that we should soon hear of the steamer being launched on the Albert Nyanza lake. A letter had also been received from Mr. H. M. Stanley, who had ascended the Rufiji river by the Simbo Ovango mouth, and sent home a map of the delta and a full account of his travels so far. The President having given a *résumé* of geographical exploration in Central Australia, proceeded to introduce to the assemblage Colonel Egerton Warburton who, though past the age when most explorers have achieved their greatest feats, had nevertheless successfully traversed the interior of the Australian continent from the centre to the west, and had received for this exploit the gold medal of the Royal Geographical Society.

Colonel Warburton, in returning thanks for the medal, alluded to the fact of McDougall Stuart having previously earned the same medal for his Australian explorations, which had been spread over three years, but his (Colonel Warburton's) had been made straight off, without any means of relief. The Colonel, accompanied by his son and Mr. Lewis, set out from Port Adelaide for Alice Springs, a distance of 1,100 miles, and, on April 15, north of MacDonnell range, turned westward. Here their difficulties commenced. Water failed, grass turned to spinifex, and sand everywhere took the place of soil. The whole line of route lay through a nearly waterless desert, with sufficient bushes to keep their camels from utter starvation. They, however, sank one by one beneath the severity of the march, and their flesh served to keep the travellers alive. After having been mercifully saved from starvation on two occasions by the providential discovery of water by a lad of the party, they succeeded eventually in reaching the Okeover River, close by the Western Coast Settlements, and here their wants were speedily relieved. The result of the journey appears to put beyond doubt the worthlessness of the interior of this huge island. A hearty vote of thanks to Colonel Warburton for his interesting paper closed the proceedings.

ANTHROPOLOGICAL INSTITUTE (Tuesday, Nov. 24.)

PROFESSOR BUSK, F.R.S., President, in the Chair. Colonel Lane Fox exhibited stone implements, and bows, arrows, and blowpipes from San Jose, Costa Rica. Mr. Charlesworth exhibited characteristic figures carved in amalgam by native Mexican miners; and a chaplet of gold and silver coins worn by the peasant women of Nazareth. The following communications were made by the President. "Notes on Ruins in the neighbourhood of Palmyra," by the late Mr. C. Cotesworth, with some observations on skulls found therein, by the President. The chief object of interest among the antiquities noted by the author, was a tower 111 feet in height, containing a square winding stair of six stories, which might be taken as a building typical of the neighbourhood. In one of the many towers lying to the south of the Kuryetein road, were many human skulls and other remains,

specimens of which were exhibited. There could be no doubt that they had been deposited in the tower 1,800 or 2,000 years ago. In an examination of the skulls and long bones, Professor Busk observed that they presented the same form and proportions as those brought by Captain Burton from Palmyra a short time since, and that they belonged to a dolichocephalic race. Mr. Bollaert contributed "Notes on some Peruvian Antiquities," and exhibited a series of drawings and photographs in illustration.

FINE ART.

EUGÈNE DELACROIX IN ENGLAND.

THE subject on which I take leave to write to-day is almost a personal one, but it is connected with a man of such eminence—of a genius so great and at the same time so much persecuted—that the questions I propose to ask ought to interest English artists and lovers of art.

Eugène Delacroix, ten days before his death, dictated to his solicitor a very minute will, dividing his fortune among his friends, and, from horror of that academic style in the name of which he had suffered a life-long persecution, giving the following directions with regard to his tomb: "I wish my tomb to be on the eminence of the cemetery of Père la Chaise, in a rather retired spot. There shall be neither emblem, bust, nor statue on it. I wish it to be copied exactly from the antique, either from Vignola or Palladio, and, unlike anything seen nowadays in architecture, to have very decided projections." He also appointed a committee of seven people to classify his drawings and paintings, which he expressly directed should be sold by public auction.

Eugène Delacroix died at Paris, in the house he had occupied in the Place Furstenberg, on August 13, 1863. He was born at Charenton on the 8th Floréal, year VI., i. e., in 1797. He did me the honour of choosing me as one of the above-named committee, and never in my life have I felt more strongly moved than when I learnt that my name and memory had been present to his great mind in the moment when, looking death in the face, he defied it to extinguish his fame.

We found that we had to deal with more than 6,000 drawings, sketches, studies, copies, &c. I mention this fact in order to show how perseveringly he laboured, whether in copying from nature or from the masters, or in carrying out his own conceptions, and how grossly unjust was the accusation incessantly brought against his works that they were the result of ready improvisation and presumptuous ignorance. The different heads under which they are classed in the catalogue which I drew up for the sale, and which but for the avarice of the residuary legatee would have been infinitely more detailed, suffice to show what a variety of ideas he mooted, and what an amount of work he accomplished. Many of his drawings bore on their margins hastily written notes, reflections on art, literature, philosophy, or nature, which crossed his mind while at work with his paint-brush or pencil. We found also a number of small albums full of notes. He always carried with him a pocket album, in which, in his leisure moments, and especially during the holiday time spent on the magnificent estate of his relative, the famous Legitimist barrister Berryer, he jotted down observations, recollections, ideas for pictures, scraps of articles. You are aware that he published some very remarkable studies on Michel Angelo, Poussin, Prud'hon, Raphael, Pierre Puget the sculptor, and Gros, on the instruction of drawing, on the caricaturist Challet (for whom he had a great regard), and even in 1829, on the engraving of a portrait of Pope Pius VII. by Sir Thomas Lawrence.

I was expressly enjoined by the committee to make a careful collection of all these scattered thoughts, in order that they might one day be published together, and to this day I have been

incessantly on the look-out for anything which would make this treasure more complete. The terrible events brought about by the Empire delayed the publication of a volume in the completion of which I am now engaged, and which, if there is no further delay, will be ready in three months. The family and friends of Eugène Delacroix placed at my disposal over 300 letters. Of these I have transcribed more than half—all of them of marked interest, and models of epistolary style. Some relate specially to art, others are more personal, and reveal a nature exquisitely tender and faithful. From his touching confidences to the friends with whom he kept up an uninterrupted correspondence from the year 1816 to 1862, we learn how this master, so full of lofty sentiments and utterly devoted to his art, was rendered profoundly melancholy by the knowledge that he was only understood by a few choice spirits.

One chapter of this work I intend to devote exclusively to England, and it is on this ground that I venture to call the attention of readers of the ACADEMY to the correspondence of Eugène Delacroix. Are there any still living who had personal relations with him during his stay in England, any who corresponded with him and have preserved his letters? Is there any one—amateur or artist—who retains an impression of his manners or conversation, or with whom he left as a memorial some painting or water-colour drawing? In short, may I hope that the lines which follow these will be read with sympathy in England, and that some one or other will be moved by them to send me here at Paris a few words of information about the people and places to which allusion is made? For such a response I should be infinitely grateful, and I should rejoice to think that I could rely on the generosity of the English press generally to give further publicity to the questions I have asked in opening what I may call an international request.

I proceed to quote some of the most characteristic passages of the correspondence:—

"Londres : Dimanche, Mai 27, 1829.

"Mon adresse est 14 Charles Street, Middlesex Hospital.

"Mon cher enfant,—Je suis depuis deux ou trois jours dans cette grande ville. . . Je suis arrivé à Calais, par le courrier, à 10 heures et demie du soir; parti le lendemain jeudi à 10 heures et demie, et arrivé à Douvres à midi et demie ou une heure, fort ballotté dans la traversée, mais point malade, ce qui m'a fait beaucoup de plaisir. J'avais cependant compté là-dessus pour me guérir d'un rhume, comme d'un petit vomitif forcé qui m'en eût débarrassé.

"J'ai eu à Douvres le temps de monter sur les falaises, dont Copley Fielding a fait une belle aquarelle que tu te rappelles, et de voir le château.

"... J'ai trouvé dans la voiture de Douvres à Londres un vieux français d'assez de mérite, et nous jouissons à dire du mal du pays devant un gros fermier qui, à la vérité, n'entendait pas un mot de ce que nous disions, d'abord faute de savoir le français, ensuite à cause de deux bouteilles de vin de Porto qu'il avait jugé à propos de prendre avant son départ de Douvres pour le consoler de l'ennui de la route. Ce qui le rendait d'une gaîté folle quand il ne ronflait pas.

"L'immensité de cette ville ne se conçoit pas. Les ponts sur la rivière sont à perte de vue les uns des autres. Co qui m'a le plus choqué, c'est l'absence de tout ce que nous appelons architecture. Préjugé ou non, cela me déplaît. Et puis, ils ont une rue de Waterloo, qui est un tas de palais d'opéra à la suite l'un de l'autre, terminé par une édifice au haut duquel est un clocher pointu.

"Mais les belles boutiques! Un luxe extrême. J'ai déjà vu beaucoup en peu de temps. J'ai été hier avec six jeunes gens, dont étaient les Fieldings, à Richmond, par la Tamise. Nous avons fait pour y aller six lieues et plus en deux heures, et de même en revenant, dans un bateau à six rames, qui mérite à lui seul qu'on fasse le voyage pour le voir. Figure-toi un violon d'amateur: tout ce qu'il y a de plus délicat en construction, en grâce, en vitesse, enfin inimaginable. C'est ce que j'ai vu de plus étonnant jusqu'ici dans ce pays. Je ne peux assez te dire combien c'est admirable. J'avais l'honneur de tenir le gouvernail. Les bords de la Tamise sont charmants."

A yawl or a canoe was a thing absolutely un-

known in France at that time. We had nothing but flat-bottomed boats:—

"... Fielding m'a retenu un logement fort bien qui ne me revient guère qu'à 40 francs par mois, ce qui est très-bon marché, n'est-ce pas? Beaumarchais a dit à tort que *goddam* est le fond de la langue. C'est *one schelling*, *sir*. Ce qui veut dire un schelling, Monsieur. C'est ce qui se trouve au bout de toutes les phrases. Je ne parle pas précisément de la conversation qu'on tient dans le palais du roi, car je n'ai pas encore été à portée d'en entendre de cette espèce.

"J'ai vu la galerie de M. West; pour un schelling, bien entendu. Il y a beaucoup de choses à en dire. . .
"E. DELACROIX."

Here is another letter of a few days later date. His impressions of England are losing their first novelty, and the judgment is no longer that of the newly landed traveller, but of the nice and discriminating observer:—

"Londres : ce 6 Juin, 1829.

"Oh. . . Il est impossible d'être mieux accueilli, et avec une politesse plus noble que par les personnes auxquelles je me suis trouvé recommandé. Je me suis cruellement ennuyé pendant les premiers jours. Depuis que je me suis mis à travailler, je me plais ici. . .

"L'aspect premier de leur peinture ne m'a pas fait plaisir. Je m'y fais à présent. Je ne m'étonne pas de l'impression défavorable qu'en rapportent ceux qui n'ont pas là-dessus les idées que nous avons. L'imitation des vieux maîtres a son inconvénient comme toutes choses.

"Il se forme une société de grands personnages qui, sous la protection du gouvernement, encourage les grands tableaux. Je crains dans cette mesure la perte de l'école anglaise. Ils ont des peintres admirables dans les proportions moyennes. L'envie de briller d'avantage les ôtera de la route qu'ils suivent. Ils feraient de grands tableaux qui ne seraient plus à la portée des particuliers. Cette société a acheté une grande croûte de M. Hilton moyennant 25,000 francs. C'est une réminiscence maladroite de tout ce que les maîtres ont fait.

"En revanche, il y a des peintures de genre très-belles. J'ai été chez M. Wilkie, et je ne l'apprecie que depuis ce moment-là. Les tableaux achevés m'avaient déçu, et dans le fait ses ébauches et ses esquisses sont au-dessus de tous les éloges. Comme tous les peintres de tous les âges et de tous les temps, il gâte régulièrement ce qu'il fait de beau. . .

"Fielding est le meilleur enfant possible. Copley est un homme qu'on ne voit pas, et peu dans sa nature. . .
"E. DELACROIX."

And in a letter of June 18:—

"... J'ai vu chez Wilkie une esquisse de "Knox le puritain prêchant devant Marie-Stuart." Je ne peux t'exprimer combien c'est beau! Mais je crains qu'il ne le gâte. C'est une manie fatale. . .

It appears (though I can find no mention of the incident in the three volumes published by Allan Cunningham), that in June, 1828, Wilkie went to see Eugène Delacroix at Paris, on his way home from a tour in Spain. He showed him some drawings, and it seemed to Delacroix that the ideas of the English artist had been completely upset by his studies of Spanish art.

Another artist of whose courtesy Delacroix speaks with pleasure was Etty.

"... J'ai vu ici une pièce de Faust, qui est le plus diabolique qu'on puisse imaginer. Le Méphistophélès est un chef-d'œuvre de caricature et d'intelligence. C'est le Faust de Goethe, mais arrangé: le principal est conservé. Ils en ont fait un opéra mêlé de comique et de tout ce qu'il y a de plus noir. On voit la scène de l'église avec le chant du prêtre et l'orgue dans le lointain. L'effet ne peut aller plus loin sur le théâtre."

[Later, in 1828, Delacroix made this scene the subject of an admirable picture, which has been exhibited quite recently for the benefit of the Alsatiens.]

"J'ai vu le *Freischütz* sur deux théâtres différents, avec de la musique qu'on a supprimée à Paris. Il y a de choses fort singulières dans la scène de la fontaine des balles. Ils entendent mieux que nous l'effet sur le théâtre, et leurs décorations, qui ne sont pas exécutées avec autant de soin, font mieux ressortir les person-

nages. Il ont des actrices d'une beauté divine qui valent souvent mieux que le spectacle. Elles ont des voix charmantes et des tournures qui ne sont que dans ce pays-ci. . .
"E. D."

He was enthusiastic about the English stage, which corresponded to the doctrines of the romantic movement then at effervescing point in literature. Shakespeare, whom he had read from his youth, and Byron, were presented to him with a brilliancy of colour and bustle of life which our more classical theatre excludes, and which Victor Hugo alone has known how to introduce into some of his dramas.

"Londres : 27 Juillet.

"... J'ai vu *Richard III.* joué par Kean, qui est un très-grand acteur. Young ne me plaît pas autant. Je l'ai vu dans plusieurs pièces, entr'autres dans la *Tempête*, qu'on a remise à la scène. . . On a changé le commencement de *Richard*: au lieu de la mort de Clarence, ils ont mis la mort de Henri VI, qui est aussi de Shakespear, mais dans la 2^e partie d'*Henri VI.* Richard, qui n'est encore que Gloster, vient dans sa prison et l'assassine à coups d'épée. Ce moment a été terriblement rendu par Kean, aussi que mille autres dont je ne manquerais pas de rabattre les oreilles. J'ai vu aussi *Othello* par lui: des expressions d'admiration manquent pour Shakespear qui a inventé *Othello* et *Iago*. . .

"... Je suis obligé à mon grand regret de manquer une représentation demain où Young doit jouer le rôle de *Iago* avec Kean dans *Othello*. Quoique à des théâtres différents, ils se réunissent pour un bénéfice. Je pense voir aussi *Hamlet*.

"... M. Elmore est on ne peut plus aimable pour moi. Je me suis mis depuis peu de temps à travailler chez lui. J'ai rencontré Mayer, qui gagne de l'argent beaucoup avec des portraits. Il est pour moi la boussole de la mode. Malheureusement dans ce pays-ci on ne va pas loin avec peu d'argent. . .

"... On a pendu plusieurs fois depuis que je suis ici; mais je n'ai pas été tenté de l'aller voir. Au reste, comme c'est le lundi et le vendredi de chaque semaine, si la fantaisie en reprend, tu vois qu'il est commode de se le passer. . .

I do not know whether there exist any other letters written by Delacroix to other correspondents. Here are extracts from the latest but one that I find in the bundle of papers before me:—

"Londres, le 1 Août, 1829.

"... Je pars demain pour un petit voyage de quelques jours, moitié par la Tamise, moitié par mer. C'est sur le yacht d'un ami de M. Elmore. Je suis fou de la marine, et j'irai peut-être sous peu dans le Cornwall avec Eugène Isabey, qui est ici. Ce serait un voyage d'une quinzaine sur les plus sauvages côtes d'Angleterre, ce qui pourrait par la suite être pour moi d'un avantage qui compenserait les dépenses qu'il m'occasionnerait dans le moment. . .

"... J'ai été chez Lawrence avec quelqu'un qui était assez recommandé auprès de lui pour qu'il fût pour nous d'une grande complaisance. C'est la fleur de la politesse et un véritable peintre de grands seigneurs. Je te le décrirai amplement. J'ai vu chez lui de très-beaux dessins des grands maîtres, et des peintures de lui, ébauches, dessins même, admirables. On n'a jamais fait les yeux, des femmes surtout, comme Lawrence, et ces bouches entrouvertes d'un charme parfait. Il est inimitable."

In March, 1828, Delacroix sent more pictures to England. They were exhibited in the British Gallery, and he wrote at the time to a friend, "Les journaux anglais en ont fait des éloges magnifiques." It would be interesting if these articles could be recovered. Among these pictures was his *Grèce sur les Ruines de Missolonghi*, and the *Marino Faliero décapité*. In this picture, which is in truth one of the most brilliant masterpieces of modern art, Lawrence took a great interest. He even showed a wish to buy it. But unfortunately he died before the purchase could be completed:—

"Je ne sais si je t'ai dit que j'avais vu Kean dans Shylock du *Marchand de Venise*. C'est admirable, et nous en causerons. Je suis inconsolable d'avoir manqué *Hamlet* par Young. Maintenant les grands théâtres sont fermés, et d'ailleurs il fait très-chaud.

"Je romps des lances pour la France contre tous les anglais possibles. Il y a dans le sang du peuple

quelque chose de sauvage et de féroce qui perce dans la canaille qui est hideuse. Ensuite, c'est un fameux gouvernement. La liberté ici n'est pas un vain mot. L'orgueil de leurs nobles et la distinction de rangs sont poussés à un point qui me choque infiniment, mais il en résulte de bonnes choses. . . .

"Vous me répondrez à l'adresse suivante: M. Eug. Delacroix, at M. A. Elmore, 3, John Street, Edgware Road." . . .

Then, in a last letter, he writes:—

"Londres: 12 Août.

" . . . Je reviens depuis trois jours d'un voyage fort agréable en Essex, où j'ai été par mer dans le navire d'un noble anglais qui y possède un château où j'ai passé quelques jours. Comme le temps était contraire pour retourner à Londres, nous avons fait quelques excursions par quelque mauvais temps qui m'a fait voir la mer un peu méchante. . . .

"Je serai à Paris vers la fin du mois. J'entrevois la possibilité par la suite d'un établissement dans ce pays, mais ce n'est pas sans appréhension. Il faudrait bien des guinées. . . . Je suis si horriblement paresseux que je n'ai aucunement travaillé l'anglais, et que je n'ai pas fait tous les progrès que je devais raisonnablement espérer après trois mois environ de séjour. Au reste, comme il arrive toujours, je quitte le pays juste au moment où j'allais parler avec quelque facilité. Tous les Français qui sont ici disent que cela vient tout-à-coup après quelques mois. . . .

"E. DELACROIX."

I have, besides these letters, a few miscellaneous notes which will be of use to me in writing the chapter on England. But they are without order.

At the time of the sale I made a catalogue of a score of water-colour sketches having English subjects—banks of the Thames, sea-pieces, landscapes—and of as many more stray sheets filled with sketches of barks at sea and various shipping details. There were also three albums and notebooks. In one of the albums were several studies of those English homes then so little known in France—the homes that had so delighted Géricault, who was the friend of Delacroix, and, by the way, a good deal more his master than Guérin, under whom he studied, had ever been. There were besides some views taken in London: among others, a very beautiful effect in light—Waterloo Bridge and St. Paul's rising in pearly white against a foggy sky, while the remainder of the scene to right and left is buried in smoke. And there was a panoramic view of London taken from Greenwich.

I found also some highly-finished drawings from the fragments of the Parthenon, which served him later for his published lithographs. Also, a great pasture-meadow with cows, and a background of purple hills, against which two church-towers stand out white and square. This picture bears the inscription, "Vu en allant chez M. Meyrick le vendredi, 8 Juillet. Fait le lendemain." And these other words, "Chez M. — le soir, à Kingston Gardens," are written under a study of an arm-chair and a Chinese screen in a room hung round with many pictures.

He made studies from the armour in Mr. Meyrick's collection, and it was at the house of this friend that he met Bonington, who on his return to Paris, being very poor at the time, came to work in Delacroix's studio. Delacroix had a great regard for Bonington, and wrote a most interesting letter about him to M. Bürger, who has inserted it at length in the *History of the Painters of all Schools*.

In a letter written in 1858, he pays compliments to the prae-Raphaelite School, of whom he says that, while imitating the early Italian painters in manner, they throw into their work a sentiment that is essentially original.

But I think I have said enough to give a clear idea, not of the influence of England on the work of the artist, but of the life of Eugène Delacroix in England. The other will furnish matter for another letter.

PH. BURRY.

THE SOCIETY OF FRENCH ARTISTS.

(Second Notice.)

THE most conspicuous landscape in this collection is the *Dante and Virgil* of M. Corot—unusually large for this honoured and excellent painter, and in especial unusually important in the scale of its figures. It is not, however, by any means a distinguished example of the master: he has evidently been oppressed by the epic requirements of his theme, and has produced a picture in which the landscape material is below his finer standard, and the figures are decidedly poor—the Dante less so than the stuffed Virgil, stuffed she-wolf, tiger that ought to be a panther, and lion. The matted and hardly penetrable forest of Dante's poem, "questa selva selvaggia ed aspra e forte," is reduced to the conditions of a grove, freely permeated by the lumour of the twilight sky. The same artist exhibits here: *The Windmill; Canal Scene, Holland*, with oak and willow foliage, very fine in its lightsome handling; *Bay of Naples*, which we should judge to have been done some years ago; and some other works. Perhaps the *chef d'œuvre* of the whole Exhibition is *The Old Stone House* by Millet—a work in which direct realization is made just as potent for expressing the sentiment of the scene as its external facts. The solid weather-worn house stands behind a rounded grassy foreground; a moist blueish-green horizon-sky is scudded over by a cloudy drift, dusky and white; the late afternoon closes in towards evening; a woman with a broom is steering some geese to leftward; to the right are some barn-door poultry, and clothes hung out to dry. This is a picture whose very simplicity leads the mind into an examining and brooding mood. Another remarkably simple work is the *Souvenir of Berkhamstead* by M. Legros: a grassy mound, with a bush and its heavy shadow, and one tree, and a pale blue sky. There is hardly enough on this canvas to warrant its somewhat large size; and yet it is a thing not readily to be forgotten. M. Daubigny exhibits *On the Banks of the Oise*—a strong, fine, moist piece of work; also *The Cooper*, with a dark rich clump of trees, the sun burning through a chink in their foliage, a mottled yellowish sky nearing sunset, and the artificer's shed below the leafage. Still more impressive than these is *The Thames below Greenwich*; with its abundant and fast-flowing stream, the heavy struggling sunlight which realises English atmosphere to the foreign mind, and here very truly realises one characteristic aspect of it, and the flapping or turrid sails of the thronging river-craft. From M. Karl Daubigny comes *Pavé de Chailly, Forest of Fontainebleau*, grand and sombre.

M. Alma-Tadema sends two choice sketches from Münster—the *Münster* of that city being the more interesting of the two, executed with all the certainty of a master, who can be rapid without missing anything of what he wants to indicate. Mrs. Alma-Tadema's little picture, *Between the Showers*, a hill-side with growing corn, has similar ability, and would be not unworthy of her distinguished husband's hand. Mme. M. Cazin shows uncommon powers of force and breadth, she also working with every appearance of unfaltering rapidity: a glance of the eye, a touch of the brush, and a portion of the picture done once for all, seem to follow with the readiness of counting one, two, three. This lady contributes several pictures, all or most of them from Sussex scenery: *Cutting Hemp* may be cited with special commendation. M. G. Michel is a vigorous landscapist, not wholly free from heaviness: his *Fishermen on the Seine* has tone and elevation, and his *Mill on the Slopes of Montmartre* recalls something of the style of Crome. The same English painter, along with Constable, may have influenced M. J. Dupré in his *Land-Storm*: very stormy it certainly is, and drenched in wet.

Numerous landscapes still remain at which the visitor should look attentively. We may name the *Winter Scene* of A. Vollon, with its deeply-

loaded pigment; *The Last House of the Village*, by J. Laurens, in which a very different effect of snow is given with energetic truth—it lies in shadow, blue-tinged under a yellow sky; *The Rhone near Lyons*, by Roman; *On the Oise*, by Mathon; *Landscape, Evening*, by Ter-Linden; *Windmills, Holland*, by C. Monet, quaint and homely in its picturesqueness; *In the Orchard*, by Marie Collart. One British painter, Mr. J. Macbeth, figures in this Gallery; his *Hampstead Lane* assimilates closely enough to the style of his foreign colleagues.

The animal-subjects include a moderately good Troyon, named *Harrowing*; *A Flock of Sheep*, by Mme. Mesdag, low-toned, and facile in its truth; and some highly efficient paintings of dead game by Scholderer. M. Fantin is, as usual, supreme in flowers: his *Clove-pinks* (No. 6) and *Pinks* (No. 46) are veritable masterpieces—magically touched and wholly delightful. Several other specimens of his work might be referred to, but they all seem to us outstripped by the two which we have named.

In the upper of the two rooms is a highly interesting series of drawings by Millet, thirteen in number. They are mostly in black chalk or charcoal; some of them have touches of tinted chalk, or washes of colour, which, in two of the set, count for something considerable in the general effect. The finest of all is *The Angelus*; an admired composition, in which two peasants, a man and a woman, at work in the fields, bow their heads, still standing upright, as they hear the church bell. Not only for grave simplicity and for sentiment, but for luminosity as well, this design is pre-eminent. Other very fine specimens are *The Gleaner*; *Peasant Woman and Cow*; *Woman Cooking*; *The Wayfarers*, again a striking piece of sunlight effect.

If France can boast in M. Millet a wonderful designer and painter of her peasant life, perfect in insight, and attaining in art an elevation all the more genuine because instinctive and unpremeditated, she can point also to a sculptor of a similar range of subject, and perhaps coequal excellence, M. Dalou. His terra-cotta *Payssanne Française*—a mother suckling her infant daughter—touches the very ideal of this style of art. Seated on a basket, and wearing her clumsy sabots, the mother is still unsurpassable for grace, sweetness, and affection: she is a thorough peasant woman, yet capable of teaching some open secret of loveliness to a princess or a nymph. This is national art, not undeserving even of a national recompense; which will be paid to M. Dalou in at least one form—that of his countrywomen's sympathy and gratitude.

W. M. ROSSETTI.

ART SALES.

ON the 12th and following days were sold at the Hôtel Drouot, the curiosities, books, paintings, and other effects, the property of Made-moiselle Mars. Occurring more than thirty years after the death of this celebrated actress, the sale created some surprise, but it would appear that M. Bronner, of Versailles, whom Mlle. Mars had made her universal legatee, preserved her bequest with pious veneration, and it is only on his death that the property is dispersed. The sale possessed a double interest from the former proprietor of the objects, and from the period to which they belonged. The fine portrait of Mlle. Mars, in the *Trois Sultanes*, Baron Gérard, was bought for 2,250 fr.; and six small paintings, by the same artist, 920 fr. Two female portraits, French school, Louis XVI. period, 1,030 fr. Portrait of Mme. de Montespan and her children, enamel upon gold, 2,150 fr. Gold bracelet set with diamonds, rubies and pearls, 825 fr. Pair of diamond and emerald ear-rings, 2,680 fr. Pair of dogs, old Dresden porcelain, Louis XV. mountings in ormolu, 950 fr. Bronze time-piece, chased and gilt, with caryatides, time of the Empire, the model executed for Mlle. Mars,

1,470 fr. Another Louis XV. period, marquetry of copper, mother-o'-pearl and enamel, 660 fr. Green bronze poodle, 690 fr. Two candelabra, Louis XV. period, female figures supporting branches, 1,050 fr. Furniture for a sleeping room, time of the Empire, of mahogany and bronze, chased and gilt, by Jacob, 1,405 fr. Cheval glass (*Psyché*), of the same period, 1,060 fr. Bedstead set, same period and decoration, 825 fr. These last were bought by M. Perrin, administrator of the Comédie Française. The room was crowded with purchasers, anxious to possess some memorial of the most popular actress of the French stage.

THIS last week Messrs. Christie, Manson and Woods had a sale of the effects of the late Mr. E. W. Johnson, of Chichester. It consisted of a miscellaneous collection of china, sculpture and other decorative objects, with about 500 pictures, ancient and modern. The prices realised were moderate. Lot (316) Bow figure of Jupiter and Juno, 5*l.* 12*s.* 6*d.* (319) Chelsea figure of Neptune, 7*l.* 10*s.* (328) Hexagonal Worcester stand and saucer, 9*l.* 10*s.* (329) Triple Plymouth sweetmeat stand, encrusted with shells, 8*l.* (405) Old Italian iron casket, 16*l.* 5*s.* (429*A*) Marble figure of Boy extracting a thorn from his foot, 25*l.* (438) English chime clock, by Bentley, 26*l.* 10*s.* Some of the pictures sold as follows:—(488) Ferg, Landscape, 10*l.* 15*s.* (497) Smebach, Landscape, 11*l.* 5*s.* (539) Honthorst, Youth with violin, 8*l.* 5*s.* (580) Berghem, Peasants and animals at a fountain, 13 guineas. (584) P. Ruydael, View near Haarlem, 17*l.* 0*s.* 6*d.* (587) Lingelbach, Italian scene, 17 guineas. (588) Canaletti, View of Venice, 20*l.* 10*s.*; and (592) another, 18*l.* 7*s.* 6*d.* (595) Breughel, Landscape with figures, 8*l.* 18*s.* 6*d.* (600) B. van Orley, Holy Family, 17*l.* 6*s.* 6*d.* (636) Old Crome, Landscape with farm buildings, 16*l.* 5*s.* (639) F. Watts, View of Winchester, 17*l.* 6*s.* 6*d.* (642) J. W. Lea, Richmond Park, 24 guineas. (644) L. Verboeckhoeven, River with boats, 10 guineas. (694) Towne, River scene, 17*l.* (704) Ommegeanck, Landscape, 17*l.* (731) Herring, Farm buildings, 10 guineas. (732) Interior of stable, 26*l.* 17*s.* 6*d.* and (733) Farm horses, a pair, 42*l.* (792) Nasmyth, a farm-yard, 11*l.* 3*s.*; and (808) ditto, with cottages, 7 guineas. (871) Morland, Landscape, 27 guineas. (878) W. Shayer, River scene, 30 guineas. (879) Coast scene, 37 guineas; (880) Landscape with peasants, 30 guineas; and (881) View in Hampshire, 25 guineas. (882) W. Shayer, sen., Harvest field, 36 guineas. (883) A. Vickers, near Nant Mill, 57*l.* 15*s.* (886) G. Smith, of Chichester, Winter scene, 33 guineas. (889) Landscape, 22 guineas. (890) Landscape, with apple gatherers, 23 guineas, and (893) River scene, 18 guineas.

NOTES AND NEWS.

By the death of M. Fortuny, European art has lost a talent who during his life had, in some quarters, the reputation of a genius. M. Fortuny was the brother-in-law of M. Madrazo; and the school of which these two have been the inspiration, had its origin in Spain, its seat in Rome, and its principal market in Paris. M. Fortuny shared with M. Madrazo the gift of expressive and vivacious drawing on a minute scale, and the power of using brilliant and complicated colour with an harmonious effect. But these dexterities he turned to no very valuable ends, and in no very dignified manner. His conceptions had the cynicism without the depth of Goya, and his touch the minuteness without the style of Meissonnier. What he and his school have loved is to invest the lowest types of human nature with the most sparkling fripperies of the collector's wardrobe—to show their skill in expressing at once the characters of mean and carnal men and women, and the subtleties of tone and combination in gorgeous stuffs of Spain, Italy, the East, or the latest Parisian manufacture. Whether so much accuracy of hand and alertness of eye were worth exercising on such matters,

posterity will probably doubt. What may be the effect of such ideals on the disciples of duller eye and looser hand, is only too certain. The approval of a certain school of Parisian judges whom any vivacity allures and no meanness of conception repels, together with the patronage of a great picture-dealer, secured for the works of M. Fortuny the repute of which we have spoken, and a market value corresponding to that repute. Several of his principal paintings have been at various times exhibited at the galleries of Mr. Wallis and Mr. Maclean. M. Fortuny died at Naples on Saturday last.

MR. ANDERSON ROSE's collection of etchings, now at Liverpool, is to be exhibited in Birmingham.

THE Liverpool Autumn Exhibition, which has been very successful, closes on Saturday next, December 5, with a conversazione of the exhibitors and purchasers.

At the Library and Reading Rooms, No. 173 North Street, Brighton, is to be seen a picture attributed to Garofalo (Benvenuto Tisio), representing the well-known and continually painted legend of the marriage of St. Catharine. It is stated to have been executed in 1537, and to have been in the Convent of the White Nuns, or Monache del Popolo. It afterwards passed into the hands of two gentlemen of Reggio, and next into the possession of its present owner, who remains unnamed in the printed prospectus. The same subject was painted by Garofalo in two other compositions—one of them in the Vatican, and the second in the gallery of the Capitol.

A LOAN Exhibition, of pictures of very various Schools, is open at the Academy of Fine Arts, Clifton, Bristol. The pictures of various Schools are contributed by their possessors in the locality, but the value of this exhibition is exceedingly enhanced by the loan from the Department of Science and Art of about a hundred studies and drawings by Turner. The exhibition has not thus far received a tithe of the support which would have been accorded to it by the inhabitants of other great towns, such as Manchester, Liverpool, and Birmingham; and to record this is to record a fact not creditable to the Bristolians. The Turner drawings—albeit many of them are but the swiftest memoranda of impressions—would repay far more study than they are ever likely to have. Their interest and quality can perhaps best be indicated by saying briefly that they are of themselves enough to have secured a man an immense fame at the hands of artists and judges. To mention, out of many, two or three most notable examples of different kinds of power, one might cite the bird's-eye view of Naples, a pencil drawing, in outline, in which a thousand house-roofs lie out, with the finest accuracy, and most consummate grouping, under the beholder's eye; and again, among more familiar effects, a *Windmill in Mist*, a *Bridge at Sunset*, and (perhaps most remarkable of all for its easy command of means) another *Bridge* with the breaking light of dawn. Passing hurriedly among the works contributed by Bristolians, one notices that W. Müller is well represented, as indeed in Bristol he ought to be. Mr. J. D. Weston is the possessor of one of his more considerable works, *The Avenue of the Sphinx, Luxor*, in which a placid moonlight and flickering fire-light mingle with cunning effect. Another result of Müller's journey to the East—*The Acropolis*, a water-colour—is in the possession of Mr. Brooke Smith, while Mr. O. Branwhite owns a charming little picture in oil—*A Sketch on Hampstead Heath*—as silvery and delicate as may be. Among the works of David Cox one should note Mr. Plum's admirable sepia drawing, *On the Lyn*, and Mr. Weston's magnificent water-colour, *Beltus-y-Cued*, which has a touch of the solemnity of the *Welsh Funeral*. Small landscapes in oil by Nasmyth and by F. Wheatley—the latter better known nowadays for his rustic groups in water-colour—are contributed by Mr. Weston and Mrs. Lunell. Mr. P. W. S. Miles,

Mr. J. W. Miles, and Mr. J. B. Harford have contributed important works of old masters—Guercino, Murillo, Salvator Rosa, Poussin. The catalogue, which we have seen, would have been the better for careful revision. Brauwer would not then have been spelt "Brower," nor Spagnoletto "Spragnoletto," but on the whole the organisers of the exhibition have deserved well of the public, and it must be repeated that the small support the exhibition has received says little for the art feeling of the inhabitants.

MR. W. J. WEBB, known to a considerable circle by his work in painting, and to a larger public as a popular illustrator, displayed at a private view in the Conduit Street Gallery on Wednesday, a small collection of clever water-colour drawings representing rural life and scenery in Wales and Surrey. Among them, one called *The Last Glass*—a scene outside a rough Welsh inn—was specially remarked for its transient effect of weather; while in *Gloaming* Mr. Webb has succeeded in catching with utmost faithfulness the hues of sandy soil and heather on the Surrey hills.

THE Spanish Government has instructed its Consular agents to be on the look-out at foreign ports for the arrival of the splendid Murillo, which has been so scandalously removed from the Cathedral of Seville. This picture, a Saint Anthony, was the special gem of the building, and the ingenuity with which the principal figure alone has been cut out from the great altar-piece shows that the robbery has been effected by expert hands cognisant of the value of the theft which they were perpetrating. From the great height at which it was hung, the thief must have used a ladder to reach the picture, and one of the most singular things connected with the whole affair is that no lock, bolt or bar was found to have been tampered with, while, moreover, a chaplain, two attendants, and two large watch-dogs are always locked up in the cathedral during the night for the protection of its numerous treasures. The figure of the Saint, who was represented kneeling in the attitude of prayer, has been so carefully removed that none of the other portions of the picture have been in any way injured; but nevertheless the value of the entire composition, which was estimated in Spain at the large sum of more than a million Spanish dollars, or nearly 200,000*l.*, is of course now entirely destroyed.

The picture was painted by Murillo in 1656, and therefore represents the painter's very best period. According to local traditionary gossip, the Duke of Wellington, then Sir Arthur Wellesley, attempted in 1813, after the repulse of the French in the Peninsula, to secure this picture for the National Gallery, offering to give as many golden onzas for it as would be required to cover the painting, and as the canvas measures fifteen feet square, it was estimated that had his offer been accepted, it would have made the Seville Chapter richer by 4,700,000 reali than they were before; but they refused to part with their most highly-prized art treasure, and the picture has continued since then the glory of the cathedral. The subject chosen by the painter is the dedication by Saint Anthony of Padua of himself in prayer to the Saviour, who is represented in the form of a child descending from heaven surrounded by the angelic host, and enshrined in a halo of celestial light, which permeates the cloud on which he rests his feet. The robbery of this picture recalls to mind another theft of a somewhat similar character perpetrated last year in the Cathedral of Granada, when the Virgin by Alonso Cano was surreptitiously cut out of its frame. In that case the thief was detected in the person of an Italian image seller, who had only recently been dismissed from prison after undergoing the term of punishment awarded to him for his sacrilegious offence. It is thought that this man is connected with a band of robbers, by whom some daring acts of vandalism have been recently effected in the Palace at Madrid and in various cathedrals and churches in different parts of Southern Spain.

THE careless inaccuracy of many French writers on Art has been recently exemplified in a most flagrant manner by M. Charles Yriarte. In his lately published *Vie d'un Patricien de Venise au seizième Siècle*, this author speaks of the well-known portrait by P. Veronese of Marc Antonio Barbaro, in the Vienna Gallery, that forms the frontispiece of his volume, as if he had been the first to discover it, or at all events to find out whom it represented; whereas the portrait in question has been recognised in every catalogue of the Belvedere Gallery since 1781 as being that of his Patrician. Even in such a small matter as copying the inscription the French writer could not take the pains to be correct, but has made three mistakes in seven words, besides giving the plain Roman letters M. A. B. F. as the signature of this painting, instead of a monogram that is not at all easy to resolve into these letters. Such inaccuracy was not likely to escape M. Yriarte's German critics. In the last number of the *Zeitschrift für Bildende Kunst* the disputed monogram is reproduced in facsimile, and some historical particulars given in respect to this interesting portrait.

THE *Gazette des Beaux-Arts* this month is chiefly occupied with the Exposition of the "Union Centrale." M. Jules Lanoue notices the products of modern industry, especially the magnificent bronzes and other works in metal, many of which are really beautiful works of art; M. J. Solers deals with the costume portion of the exhibition, and gives us a slight sketch of the history of shoes in the mediæval period. The subject is abundantly illustrated, and we have some curious examples of the long-pointed *soutier à la poulaine* of the fifteenth century, the square-toed German shoes of the sixteenth century, the absurdly high pattens and the high-heeled shoes of the time of Louis XV. The library of the Union Centrale, a library formed for the purpose of popular instruction in Art, and open without any restriction to all the visitors to the Union, is no doubt an excellent institution; but considering that the *Gazette* already contained two articles on the Union, M. René Ménard might, one would have thought, have found some other subject for his versatile powers. The other articles of the number are an essay on the teaching of geometric drawing, a critique on the Exhibition of National Manufactures, by M. Albert Jacquemart; a continuation of M. Clément de Ris' descriptive history of the Stockholm Museum; and a slight account of the Dutch engraver known as Dirk Van Staren, or the Master of the Star, written to accompany a fine heliographic reproduction of one of his very rare prints, *St. Bernard Kneeling before the Virgin*. An etching by Walter from Rembrandt's painting of the *Oath of Ziska* in the Stockholm Museum will also attract connoisseurs. The minor illustrations are mostly of products of art industry.

THE *Neue Froie Presse* learns from Rome that Raphael's celebrated *Violin Player*, which was lately reported as lost, has been found. The Government has made an official statement that the picture exists in the Palazzo Sciarra, where it is in the Prince's bedchamber, instead of being in the gallery.

THE painter Franz Gaul, father of the two eminent painters, Franz and Gustav Gaul, died suddenly last week in Vienna.

It is decided to erect a statue to Holberg in his native city of Bergen, and the Danish sculptor, Professor Stein, has been commissioned to execute the work. Since the Bergenses have let so many years slip by without showing any particular honour to their great townsman, they might surely wait now until 1884, which will be the second centenary of Holberg's birth.

SIR GILBERT SCOTT, in alluding to the vexed question of the completion of St. Paul's, in his presidential address before the Institute of British Architects, stated that unless some "new and un-

pledged" agency arose to clear the utter chaos into which the subject had fallen, it was to be feared that "the noble project of completing St. Paul's that has for years excited such lively interest was doomed to inevitable shipwreck." But whatever might be the course pursued, Sir Gilbert Scott urged that the work should be one of "completion and decoration, and in no degree, however small, a work of architectural alteration."

At the late exhibition of the Union Centrale, a French inventor named Caussinus, put forward a discovery by means of which plaster casts might be made to imitate exactly the texture of the object, either marble or bronze, reproduced. Everyone knows the crude glaring effect of white plaster; if this can be done away with without deterioration in the truthfulness of the reproduction, it will certainly be a great advantage. We commend it to the attention of the authorities at South Kensington. The process is said to consist in covering the surface of the cast with a coating of some chemical solution, afterwards darkened by the action of sulphur. This solution, it is stated, also serves to give strength and durability to the cast. Probably some metallic salt and sulphuretted hydrogen are employed.

Among other art exhibitions that are announced for next year, we see that it is proposed that one shall be held at Edinburgh, a city that has hitherto eschewed such frivolities. With true Scotch economy, it is decided that the New Infirmary shall be used for the purposes of exhibition, so as to save the cost of building.

THE Académie des Beaux-Arts has elected M. Matedjko foreign associate in the place of Kaulbach.

At the general meeting of the Cambridge Antiquarian Society on November 9, 1874, the following articles were exhibited:—

By Mr. Deck: (1) A flint axe of the middle period of the stone age. (2) A bronze spur. Both these articles had been recently discovered at Bottisham Lodge.

By the Secretary: (1) A bronze medal, supposed to be unique, showing on the obverse the bust of our Lord, encircled with the Byzantine nimbus and the legend EMMANYHL (*sic*); on the reverse, the adoration and offerings of the three Magi to the Holy Child, who is seated on the Virgin's knee. The guiding star is seen above, and two doves below in the exergue. This piece once formed part of Lord Pembroke's collection, and is assigned, from the general character of the design and execution, to the time of Justinian Rhinotmetus—the close of the seventh century. (2) Two statuettes of terra cotta from a find of more than a hundred similar objects last spring at Tanagra. These figures are respectively 8½ and 6 inches high, and represent an elderly and a young lady fully draped. The tunic (*χιτών*) is visible, as also the gown (*-ἱπλος ποδήρης*), which is of a light red colour, and the shawl (*χλαμύς*), which is blue. The elder of the two ladies carries a leaf-shaped fan: both the hands of the younger are concealed in her drapery. From inscriptions found in the neighbourhood, as well as from the easy grace of the pose of each figure, their execution is referred to the time of Alexander the Great.

Mr. Luard quoted in illustration of these figures:—

"καὶ γὰρ οἷ' ἀντιστρέφα
Ταναγρίδων λεικωπέπλοισι
μήγα δ' ἐμὴ γέλαθε πόλις
λεγομένης τῆς ἐν πύργῳ."

Corinna ap. *Hephæstion*, p. 106.

It was requested and resolved that photographs should be taken of each figure for the Society's Transactions.

AN election will take place at the Royal Academy on December 9 to fill the vacancy caused by the death of Mr. J. H. Foley. The distribution of Academy medals will take place on the following day.

THE STAGE.

THE drama, no less than astronomy, has instances of luminous bodies that have been obscured by the exceeding brightness of surrounding stars, and been classed among the smaller lights until a special telescopic apparatus has been brought to bear on them. Miss Amy Sheridan, however, had acquired fame long before last Saturday, when she commenced her term of management at the Opéra Comique Theatre. She was celebrated among lovers of burlesque for possessing the stature of an Olympian goddess, for assuming a look like Jove's to threaten and command, and for appearing in the attire of a Lady Godiva, of a Venus before Paris, of an Eve before the Fall. Yet not being content with this reputation, she seems to have thought that the magic of property would turn her accomplishments to gold, and she has found two authors of repute to agree with her conclusions. The first is Mr. John Oxenford, whose short pieces have been recently played at the opening of several new theatres. The second is Mr. Burnand, who undertook to refashion his burlesque called *Ixion*, which was produced at the New Royalty Theatre in 1863. There are few dramatic entertainments which an overfed or an underbred audience will not tolerate when spiced with lively music, pretty faces and scanty dresses; but they would not tolerate *Ixion*. Yet the subject has been found capable of humorous treatment in other hands. Some will recall an Ixion standing in the celestial Hall of Music among goddesses practising a new song by Euterpe, words by Apollo—a song sure to be popular, for it was all about music and the misery of existence—while the Queen of Heaven was cutting out peacocks in small sheets of note-paper; and Venus, with wild, liquid glance in her eyes and a smile like summer lightning, was inviting the Thessalian king to her pet watering-place of Cnidos, where the invalid Asiatics and valetudinarian Persians were outnumbered by her yellow-haired heroes; while Apollo, with shirt-collar thrown open and long curls theatrically arranged, declared that Greece was his peculiar property on the ground that he wrote his best verses at Delphi, and reflected how satisfactorily he had flayed Marsyas for proclaiming his first volume to be pretty good poetry for a god; while the Thunderer agreed with Marsyas, and called to Mercury for one of his good stories; and how, when Ganymede brought the tea, Ixion went out with Juno into the amethystine twilight of Olympus, and the father of gods and men waited for his soup: and, having tied the Thessalian to a wheel of the sun, ordered an eclipse to take place till the chariot was repaired. But this was not the burlesque of Mr. Burnand. Mr. Burnand's play was unhesitatingly condemned. And, though it is unpleasant to hear a resolute body of young men hissing an irresolute body of young women, yet the latter should remember that their opponents do but express a sound principle in a rude and ungenerous manner, not to be gainsaid by petulance on the stage, nor by partisanship in the stalls, nor by the varied art of the florist.

RIDICULE, which in France, "kills," is in England sometimes an aid to success, and sometimes the proof of it. Not only is the Hamlet of Mr. Irving now nightly burlesqued by Mr. Odell at the Globe Theatre—where an *opera bouffe* has been withdrawn to make way for this performance—but it will, after Monday next, be nightly burlesqued at the Princess's, by Mr. George Belmore. Poole's travesty affords to Mr. Odell his opportunity. Mr. Belmore will be indebted to a piece written for the present occasion.

On Thursday evening Mr. Henry Neville took his benefit at the Olympic Theatre, appearing in *Two Orphans* and in a favourite light comedy part—that of Ruy Gomez in *Faint Heart Never Won Fair Lady*.

MISS HELEN FAUCIT comes once again upon the stage. She has consented to appear on December 12 for the benefit of the Theatrical Fund, and will then, supported by many important members of the profession, enact Beatrice in *Much Ado about Nothing*.

It is Miss Ellen Terry who, in the place of Mrs. Kendal, will act Portia in the forthcoming performance of *The Merchant of Venice* at the Prince of Wales's Theatre.

THE first performance in England of the *Prés Saint Gervais* is fixed for this evening, at the Criterion Theatre.

AMONG recent movements in the world of *opéra bouffe*, we may mention the Saturday morning performance of *Giroflé-Girofla* at the Gaiety by the company from the Philharmonic at Islington, and the evening performances at the Gaiety of *La Fille de Madame Angot*, with a cast partially familiar, partially new. We have seen Mr. Cotte before now as Ange Pitou, and Miss Loseby as Clairette, and Miss Alice Cook as Amaranthe, but Miss K. Monroe is new to us as Lange.

MR. HOLLINGSHEAD has determined to present *The Merry Wives of Windsor* with a strong cast at the Gaiety Theatre, a few days before Christmas Day. Mr. Phelps, as has been announced, is to play Falstaff; Mr. Hermann Vezin, Ford; Mr. Righton, Sir Hugh Evans; Mrs. John Wood, Mrs. Page; Miss Rose Leclercq, Mrs. Ford; and Miss Furtado, Anne Page. Messrs. Cecil, Bedford, Forbes Robertson, Maclean, Taylor and Soutar will also form part of the cast. There will be new music by Arthur Sullivan, and scenery by Grieve, Gordon and Harford.

THE Holborn Amphitheatre will open on December 19 with a pantomimic and musical performance under the direction of Mr. John Hollingshead.

THE Crystal Palace continues its second series of performances of standard pieces, of which we may shortly speak more fully. *The Merchant of Venice* was played there on Thursday, Mr. Creswick and Miss Geneviève Ward being the chief performers. In other respects the cast was not a strong one.

MISS CUSHMAN—of whom a correspondent was able to give us some account in the last number of this journal—took leave of the New York stage on Saturday, November 7. She played Lady Macbeth before an audience which hung on her performance with the utmost enthusiasm. Afterwards, Mr. Cullen Bryant gave her a laurel-wreath, and some leading citizens of New York bore torches in front of her as she went home to her hotel.

WE hear that a new high-class periodical devoted to the stage will shortly be issued in Paris, under the direction of M. Jules Bonnassies. It is to be called *Le Théâtre*.

ANYONE who sometimes wastes his time by reading the Paris *Figaro* may remember a series of rather good jokes lately made by one of its writers on the subject of the Paris Vaudeville Theatre: its dulness, which caused *habitués* to resort there for after-dinner naps; its seclusion, which qualified it as the new locality for the Evening Bourse (*la Petite Bourse*) found too disturbing amid the traffic of the boulevard; its seemingly curious mechanical contrivance by which it managed to revive old pieces in regular sequence (*Les Faux Bonshommes* following *Les Ganaches*, and *Les Pattes de Mouche* following *Les Faux Bonshommes*), and finally an accident occurring to this curious machine, and the consequent production of that nine days' wonder, a new piece. And truly the Paris Vaudeville has been strangely unfortunate, and has deserved the jokes directed against it. A graver opponent than the "Monsieur de l'Orchestre" of the *Figaro* has now made his appearance, and that is the redoubtable Monsieur Francisque Sarcey—weary for the

moment of finding fault with feeble Mdle. Tholer at the Français, and willing, for a change, to see weakness in other quarters. The misfortunes of the Vaudeville M. Sarcey ascribes to want of a capable director "armed with powers." Nay, it is not so much the *capacity* as the *authority* of a manager that is lacking there, while provided everywhere else. For, says M. Sarcey, "one fool who can order is better than ten clever men who can deliberate." It is owing then, seemingly, to the absence of the fool who can order, that the company itself is so little representative of the movement of the day in theatrical affairs. At the Français, at the Gymnase, the illustrious aged are supported—nay, often unpleasantly rivalled—by younger artists more familiar than they with the tone of society just at the present moment, and with the aims of the younger writers for the stage. The critic finds, and finds justly enough, that there is an old-fashioned air about this Vaudeville company. They don't act badly, but they are the ladies and gentlemen of a dozen years ago: neither new enough to be piquant, nor old enough to be interesting: they are flat, like last year's fashions, having as yet borrowed no grace from their insufficient antiquity. The acting in Théodore Barrière's last piece, *Le Chemin de Damas*, is said to be such as on the whole to justify this criticism, though Mdle. Bartet, who appears in the piece, is excellent as *ingénue*: one of the few naïve actresses whose *naïveté* is not obviously assumed. An episodic character, who is the kind of witty chorus Mdme. Fargueil used to be, is played, not well, by Mdle. Jane Essler, who knows how to make a given word vibrate in a dramatic situation, but has not learnt the more delicate art of natural and pointed talk.

Les Deux Comtesses, a three-act comedy, will be the next piece produced at the Gymnase. Mdmes. Fromentin, Othon, and Legault, and MM. Pujol, Andrieu, and F. Achard, will represent its principal characters.

Le Mangeur de Fer, a terrible melodrama of the Ambigu—the work of M. Edouard Plouvier, who has since aimed higher, and failed, at the Odéon—was revived a few nights ago at the Théâtre de Cluny.

M. SARCEY has been lecturing in Paris on the *Don Juan* of Molière.

Adrienne Lecouvreur, the famous piece by M. Legouvé, in which Rachel used to act the heroine, has just been revived for the second time at the Théâtre Français with Favart in the title rôle. She played this part for the first time, with some success, three or four years ago, but the chief point of interest about that revival of it was that it gave Jules Janin an opportunity of writing, from his arm-chair at Passy, an exquisite criticism, not of Favart, but of Rachel herself.

MEILHAC and Halévy are indefatigable. They had another new piece ready for representation at the Palais Royal this week. It is called *La Boule*.

PAUL LINDAU's new comedy *Ein Erfolg* has had a sensational success at Berlin at its second performance. The first night resembled very much a *première* of Wagner's operas, as there were two parties, one continually applauding, the other one constantly hissing. Paul Lindau, whose sarcastic criticisms have made him many an enemy, has given in this new piece very good pictures of journalistic life in Germany.

M. HERVÉ has just completed a new three-act comic opera, named *Alice de Nevers*, or *Les Faveurs de la Cour*, which will be brought out about the middle of January in Paris, probably at the Folies Dramatiques, where M. Hervé has had his greatest successes. The libretto, also from the pen of the composer, is, we are informed, full of sarcasm on Court life.

A FRENCH paper publishes an interesting report

of the results of the Association of Dramatic Artists, founded by Baron Taylor in Paris thirty-four years ago. According to this report, the Society is at present worth 3,722,216 fr. Out of the interest of the capital pensions are paid to 204 individuals, 71 receiving 200 fr., 59 receiving 300 fr., 2 receiving 400 fr., and 72 receiving 500 fr. Besides this, eighteen orphans are educated out of the funds, and last year 15,330 fr. were distributed for the support of 322 members.

MUSIC.

Two novelties were introduced at last Saturday's concert at the Crystal Palace, neither of which, however, achieved any brilliant success. The first was Spohr's symphony in E flat, the earliest, and by no means the best of the series of nine (including the "double-symphony") which he composed. Though highly finished from an artistic point of view, it is in its actual musical value far inferior to the D minor symphony, or the "Weihe der Töne." The scoring is rich and masterly, but the first ideas are for the most part deficient in charm; and the symphony as a whole seems to have come from the head rather than from the heart. The other novelty of the afternoon was Liszt's second pianoforte concerto, played on this occasion for the first time in England. Like its predecessor, the concerto in E flat, which has been several times performed in this country, it is rather a fantasia or rhapsody for piano and orchestra than a concerto in the ordinary acceptance of the term; and it is constructed on so novel a plan—which Mr. Dannreuther in his analysis calls a "metamorphosis of themes," the main themes being introduced in all possible shapes that though one cannot but feel that a certain kind of unity is the result of this procedure, the effect of the whole is, at least on a first hearing, certainly obscure. One finds beautiful fragments (as for instance the opening *adagio*, the episode in E major for the strings), but these are mixed with so much that is *bizarre*, and times with such straining after effect, that the loud applause which greeted the close of the work must be set down to the account of the play rather than of the music. Mr. Dannreuther gave a most masterly rendering of the enormous difficult solo part; seldom, indeed, if ever, has been heard to more advantage; and he fully deserved the recall he received.

The overtures at this concert were those to *Die Zauberflöte* and *Ruy Blas*; the vocalists were Mdme. Sinico-Campobello and Mr. Vernon Rigg. This afternoon Handel's *Allegro and Penseroso* work very seldom heard in public, will be produced for the first time at these concerts.

LAST Monday's Popular Concert at St. James's Hall, though not marked by the production of an absolute novelty, was well varied in its programme, and of uniform interest. Perhaps the most important item was Schumann's Trio in G minor, excellently played by Miss Agnes Zimmermann and Messrs. Straus and Piatti. This beautiful work is so characteristic of its composer that it is surprising it should not be oftener played. The present was only its second performance at the concerts. Miss Zimmermann selected for her Mendelssohn's sonata in E, Op. 6, a youthful work of its composer, and one of those in which the influence of Beethoven is most clearly to be felt. The lady's finished and artistic playing is too well known to need any praise here. She also joined Herr Straus in Schubert's "Rondo Brillant" in B minor, for piano and violin, an old favourite at St. James's Hall. The quartet was Haydn's E flat, Op. 71, No. 3, which opened the concert—a most pleasing specimen of the genial master. Mr. Santley was the vocalist. Next Monday the programme will be of special attractiveness to those who are interested in modern German music, as besides Rheinberger's piano quartet, one of Raff's sonatas for pi-

and violin is announced, Dr. Bülow being the pianist, and making on this occasion his last appearance before Christmas.

THE principal features of the Albert Hall Concerts during the past week have been the production on Tuesday (the English night) of Sullivan's symphony in E minor, of Mr. J. F. Barnett's "Overture-symphonique," and of Mr. H. Leslie's overture to the *Templar*; on Wednesday, Mozart's symphony in D, and Mendelssohn's violin-concerto (M^{me}. Norman-Néruda), were the leading features of the programme; on Thursday *Israel in Egypt* was performed; and last night, in addition to the Wagner selection, Mr. Oscar Beringer was announced to play Henselt's concerto. As there appears to exist considerable misunderstanding as to these "Wagner Nights" it may be as well to remind our readers that according to the original prospectus of the concerts, Fridays are devoted to the "Modern German School" in general, and are called Wagner nights simply because Wagner is the leading representative of that school. The second part only of each programme is devoted to his music.

THE society which was founded about a year ago under the name of the Musical Artists' Society is about to commence its second season; and the present is therefore a favourable opportunity for giving a short account of its aims. It is established for the purpose of giving its members an opportunity for trying and, when practicable, producing in public their new compositions. Two very interesting trials were held last season, at which several important works were brought to a hearing; and those who desire, whether as composers or listeners, to promote the cause of English music cannot do better than join this society. The honorary secretary is Mr. Arthur O'Leary, and the honorary treasurers Messrs. Stanley Lucas, Weber, and Co., from whom any information can doubtless be obtained.

DR. SPITTA, the biographer of Sebastian Bach, is shortly about to give a series of lectures on the life and works of the great composer in the hall of the Gewandhaus at Leipzig.

SCHUMANN'S *Genoveva* was produced at Hanover for the first time on the 14th inst.

M. LECOCQ, the popular composer, has lately, it is said by the *Signale*, found himself in difficulties with the operatic managers at Paris. In a contract with the director of the Théâtre des Variétés, he bound himself to allow none of his pieces to be performed before the *Près Saint Gervais*, and also to allow a month to elapse before the appearance of any other of his pieces. As far as could be foreseen the *Près Saint Gervais* would be produced at the latest on October 10. M. Lecocq therefore promised his *Giroflé-Girofla* to the director of the Renaissance Theatre for November 10. The latter made every preparation for producing the last-named work at the appointed time; but a delay occurring with the former piece, M. Bertrand, the director of the Variétés, came forward with his contract, and claimed from the composer the sum of 25,000 francs, alleging that the non-performance of the *Près Saint Gervais* was owing to the remissness of the composer in the completion of his music.

How much the art of singing is on the decline among Italians is shown by the fact that the most important singers on the Italian opera stage are for the most part not Italians. The Apollo Theatre at Rome counts for the opera season 1874-75 thirteen first and second voices, of which six—and those the best—are foreigners, and these six will draw three-fifths of the amount of fees payable to the whole thirteen, amounting to 284,000 francs. The six mentioned are: Mesdames Stolz (45,000 fr.), and Wisiak (36,000 fr.), both Austrians; M^{me}. Sainz (9,000 fr.), German; and MM. Nicolini (35,000 fr.), Lefranc (24,000 fr.), and Castelmarty (14,000 fr.), Frenchmen.

THE German papers announce that Herr Otto Dessoff, the excellent Hofkapellmeister, who is about to exchange his post at the Vienna Opera for Karlsruhe, has been appointed Director of the future South Kensington National Academy of Music.

IN the circle of German amateurs in London the news brought by private letters from Berlin that Franz Abt, the composer of so many a beautiful "Lied" and part-song, is coming to London to give a series of grand concerts, causes considerable excitement. If there is any truth in the report, we shall most heartily welcome Herr Abt in London, but at the same time we shall regret his venturing on an undertaking so perilous as "grand concerts" are in London.

THE revival of Gluck's *Iphigenie in Aulis*, which will take place this week at the Vienna Opera, is to be considered the celebration of the hundredth anniversary of this classical opera, which was performed for the first time in Paris on April 19, 1774. The first performances in Vienna were on December 17 and 20, 1808. Gluck was in 1774 in Paris, and the decree which named him "K.K. Kammer-Compositeur" (imperial and royal chamber composer), with 2,000 gulden a year, was sent to Paris on October 18.

WE learn from Berlin that a new three-act opera, by Wilhelm Taubert, named *Cesario*, to which Herr Emil Taubert has written the libretto after Shakespeare, has been produced with great success at the Berlin Imperial Opera. Frau Mallinger, Frau von Voggenhuher, and Herren Betz and Fricke had the principal parts.

IN our issue of July 25 we mentioned the probability that Wagner's *Lohengrin* would be produced this season at the Royal Italian Opera. We hear now on good authority that Mr. Mapleson intends to put the same piece on the boards of Drury Lane, at the same time, with M^{me}. Nilsson as Elsa, M^{lle}. Tietjens as Ortrud, and Signor Campanini as Lohengrin.

WE hear that Mr. Mapleson hopes to be able to open his new Opera House on the Thames Embankment, near the site of Northumberland House, for the season, the year after next.

POSTSCRIPT.

No. XI. of Petermann's *Mittheilungen*, contains a translation of an interesting account by Lieutenant Wheeler, of the United States Engineers, of the researches of his exploring parties in New Mexico and Arizona during the season of 1873. At a place called Jemez, not far from Santa Fé, the chief town of New Mexico, they came upon the holy temple of Montezuma, a primitive structure with neither doors nor windows, entrance and egress being effected solely through a hole in the roof, to which a ladder affords access. In this temple a fire is kept constantly burning till Montezuma shall return to earth, and erect a mighty kingdom for his people. Their route from this point lay westward, and took them through the Mexican settlement of San Mateo, the range near it forming the watershed between the Pacific and the Gulf of Mexico. The country here is lofty, and though it yields but scanty production nowadays, compared with what it did formerly, still, thanks to the rains in July and August, it generally affords healthy pasture for the flocks and herds. Fort Wingate, a military station close to the Arizona frontier, was erected in 1864 in consequence of depredations and disturbances created by the Navajos Indians. A short excursion was made to some old diamond fields a few miles north-east of Defiance. The diamonds there were "discovered" by some swindlers a few years ago, who managed to form a company and took the earliest opportunity of bolting with the cash subscribed, to the no small discomfort, it is said, of some San Francisco bankers. Lieutenant Wheeler states,

with regard to some of the Apaches whom he came across, that he was surprised to find so little trace of the wild man in their faces, their features being of a European type and their complexion lighter than that of other Indian tribes. Their numbers are said to reach about 7,000. The rest of Lieutenant Wheeler's route lay southward through Arizona, and then back through New Mexico to Colorado. It does not call for extended notice, but the amount of information collected must prove of great service to the United States Government in furnishing them with a better knowledge of their territories. The paper is illustrated by an excellent map drawn from Petermann's six-sheet map of the United States, in Stieler's Hand Atlas.

THE working-men of Bedford have formed a Shakspeare Society, for the reading and discussion of the poet's works. It is to be in union with the New Shakspeare Society.

A NEW painted window has just been placed in the Guildhall, already rich in adornment. The subject illustrated has some historic interest, being the restoration of the City charter, as alluded to by Macaulay in his *History of England*, vol. ii. pp. 462-3, thus: "It was determined that the charter which had been forfeited six years before should be restored, and the Chancellor was sent in state to carry back the venerable parchment to Guildhall." The subject occupies the entire window, with the exception of the upperspandrels, which contain the arms of the donor and the Saddlers' Company, of which he is a member. The designing and executing of the above was entrusted to Messrs. Gibbs and Moore, of 89, Southampton Row, London, W.C.

THE Shakspeare Memorial Library, in the Free Library at the Guildhall, Cambridge, is, with the exception of forty-one volumes, the sole gift of Mr. Henry Thomas Hall, who has always shown an unwearied interest in the success of the Free Library. His contribution to the Memorial Library comprises 1,011 volumes, which include 107 English editions of Shakspeare's Works, 151 editions of the Plays, Poems, and Selections, and 373 works that illustrate the Life of Shakspeare or his Works. Donations of books or money towards completing the Shakspeare Library will be gladly received by Mr. H. T. Hall, or by the Librarian, at the Free Library, Guildhall, Cambridge.

SATURDAY, DECEMBER 5, 1874.

No. 135, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Poetical Works of William Blake. Edited, with Memoir, by W. M. Rossetti. (London: George Bell & Sons, 1874.)

It would not be easy to find a more notable instance of Time's revenges than the numerous works on William Blake which the last ten or twelve years have produced, as a consequence chiefly of Mr. Gilchrist's remarkable book. But there could be no reason for surprise had these works been tenfold as numerous. The extraordinary merit of Blake as an artist in words and forms, revealed to Englishmen at large just when their prevalent moods and tastes were such as would dispose them to appreciate that merit; his singular interest as a personage, and the enigmatical character of much of his work; lastly, the attractions of Mr. Swinburne's unique essay, would be quite sufficient to account for the curiosity displayed, and for the pains taken to satisfy that curiosity. The latest addition to Blake-literature is very welcome, as presenting in a more convenient and accurate form much that was already known, with the addition of not a little which, except to a very select few, was hardly known at all.

Mr. Rossetti's memoir furnishes a good account of Blake's life and work, with a fair amount of critical comment on some disputed points in the former, and some noteworthy features of the latter. On the two points of Blake's sanity, and of his conduct in his friendly and business relations, Mr. Rossetti is almost unnecessarily, though excusably, copious; and he has evidently an opinion of his own on these points, which he has carefully softened in the expression. These two questions, indeed, since the publication of the *Critical Essay*, are somewhat "tickle o' the sere," and apt to explode upon the incautions handler. Mr. Swinburne, it will be remembered, following Mr. Gilchrist in his opinion on these two points, has expressed himself with considerable vehemence on the subject, and Mr. Rossetti is evidently a little afraid of exposing himself to the thunderbolts which Mr. Swinburne holds ready for those who are not of his way of thinking. But, notwithstanding this caution, he hints pretty plainly that it will go near to be thought shortly that Blake *was* mad, and that the artist's conduct, in one instance at any rate (the MS. epigram on Hayley), was at least unjustifiable. We think that there can be little doubt that his conclusions might have been safely stated with much less qualification, that Blake was most undoubtedly mad, unless the meaning of words is to be strangely perverted, and that he

must have been a very awkward person to keep on good terms with. Blake's advocates in the matter seem to us not only to have made the old mistake of the Stoics with their wise man, and to have imagined that so good an artist must necessarily be impeccable and perfect in every relation of life, but also to have fallen into a logical pitfall. Instead of hurrying from the statements that madness is a mark of inferiority, and that Blake was a very superior man, to the conclusion that Blake was not mad, why not argue from the far safer premisses that Blake was a very superior man, and that Blake was mad, to the conclusion, well sustainable from other instances, that some madness does not of necessity imply inferiority?

The truth of the matter seems to be that this whole subject is, in a manner, beside the question. Let us suppose that Blake was not, in the ordinary acceptance of the term, fully sane: does this in the least interfere with our perception of the fact that the "Mad Song," for instance, is one of the most unapproachably magnificent lyrics in the English language? Let us suppose that he behaved unjustifiably to Stothard, unreasonably to Hayley: does this prevent his being far superior to Stothard in the arts of design, immeasurably superior to Hayley in the art of poetry? Let it be remembered that what we have to do is to enjoy, in the fullest measure and with the uttermost understanding, the work which the man Blake has left us, and not in any appreciable comparison of degree to ferret out the personal peculiarities of the man, or to bandy words about the irrelevant weaknesses which he may or may not have had. The man is dead, the work lives; and hence we may gather the measure of importance which should be attached respectively to the possible defects of the one and the certain excellences of the other.

As affording the best opportunity yet given for the study of these excellences, Mr. Rossetti's publication deserves cordial welcome. It gives a more extensive and less adulterated collection of Blake's poetical works than has yet appeared, and presents this collection in a form the best adapted for study. The omissions are very few. Three pieces only are wanting on the ground of copyright. Two of these Mr. Rossetti is probably right in characterising as trifling; the third, "Long John Brown," we have always thought of value, both as illustrative of Blake's manner, and as affording much scope for that conjectural interpretation which, if it does nothing else, sharpens the wits of the interpreter. With the exception of these, and of a few scraps which have not been deemed worthy of insertion (surely the very pretty "Marriage Ring" might have found a place?), the whole body of Blake's lyrical work is here contained, besides two semi-prophetical pieces, the "Book of Thel" and "Tiriel," the latter now first printed. The juxtaposition of these books with the more strictly poetical work is exceedingly valuable and welcome.

First in order of place, as of time—first also, to our thinking, in poetical merit—come the "Poetical Sketches." Mr. Rossetti admits that Blake never "surpassed in absolute lyrical gift, nor yet in literary finish, the most

excellent things" in this little volume. We should be inclined to say that he never equalled them. In these earliest verses there is no trace of the mystical and prophetic rage which was afterwards to transform Blake from a poet into a seer. The detestable heresy of instruction had not then laid hold of him, by which heresy when a man is once affected, whether the instruction he gives be moral or immoral, orthodox or unorthodox, it is almost hopeless thenceforward to expect perfect work to be produced by him. He becomes careful of what he says, instead of being careful how he says it; anxious to say something in any manner, rather than anxious to say everything (or it may be nothing) in the best manner possible. No such evil anxiety had come upon Blake at the time when the "Poetical Sketches" were written, and the greater number of them are in consequence pure gold, perfectly worked up. The "Mad Song" we should rank, venturing to differ from Mr. Swinburne on this point, as decidedly superior to Webster's famous dirges, and to everything which could possibly be compared with it. It is so short that, well-known as it is, or ought to be, it may, perhaps, be reproduced here:—

"The wild winds weep,
And the night is a-cold;
Come hither, sleep,
And my griefs enfold! . . .
But lo! the morning peeps
Over the eastern steeps,
And the rustling beds of dawn
The earth do scorn.

Lo! to the vault
Of paved heaven,
With sorrow fraught
My notes are driven:
They strike the ear of Night,
Make weep the eyes of Day;
They make mad the roaring winds
And with tempests play.

Like a fiend in a cloud,
With howling woe
After night I do crowd
And with night do go;
I turn my back to the East
From whence comforts have increased;
For light doth seize my brain
With frantic pain."

Nothing can surpass this masterly expression in few words, and those not boisterous or loud, of the possession of the whole soul by frantic, hopeless, reasonless pain, which clings to the windy unrest and troubled gloom of night as at any rate not out of harmony with itself. Nothing can be finer than the single touch by which the doomed soul intimates its knowledge that other souls are not equally cursed—

"I turn my back to the East
From whence comforts have increased"—

for others, but not for me. It will be noticed that Mr. Rossetti has restored "*beds of dawn*," in the first stanza. The reading "*birds*" is not, however, as he seems to think, peculiar to Gilchrist's edition. It is so printed in Southey's *Doctor*, where the whole poem appears, presumably extracted from an original copy. "*Beds*," however, appears to us much better; nor is "*rustling beds of dawn*" too far-fetched an expression for the loose texture and shaken ragged outline of the clouds whence the sun rises, while it should be observed that the

whole imagery of the poem is atmospheric and daemonic, ordinary living things being nowhere introduced.

Of the other poems included in the "Poetical Sketches," the shorter pieces are almost uniformly good, and the longer almost uniformly bad. Blake's extraordinary lyrical faculty could not, apparently, support him through any lengthened effort, and the slips and blurs which abound even in the shorter poems, so as to suggest an almost total lack of ear in the poet, are still more perceptible in the longer. Yet it was impossible for him at this time to write anything quite free from beauty, and even in such dreary stuff as "Gwin, King of Norway," flashes may be found, as in the image of the chiefs standing around the King

"Like reared stones around a grave."

But the pre-eminent beauty of the Addresses to the Seasons and the Muses, or of such songs as the following, is enough to excuse any amount of rubbish:—

SONG.

"Memory, hither come,
And tune your merry notes:
And while upon the wind
Your music floats,
I'll pore upon the stream
Where sighing lovers dream,
And fish for fancies as they pass
Within the watery glass.

I'll drink of the clear stream,
And hear the linnet's song,
And then I'll lie and dream
The day along:
And, when night comes, I'll go
To places fit for woe,
Walking along the darkened valley
With silent melancholy."

All critics are agreed in expressing the sense of astonishment with which one reads such verse as this, written in the full heyday of Akenside and Blair. So utterly incomprehensible is the anachronism, that from a scientific point of view it would be quite a relief if the whole thing could be proved a forgery, and if Blake could be shown never to have existed. As to want of appreciation on the part of his contemporaries, the only subject for legitimate wonder is, that he met with any appreciation at all.

Next to the "Sketches," Mr. Rossetti has printed the "Book of Thel," which up to this time has been chiefly known by Mr. Swinburne's abstract. Thel, Daughter of the Seraphim, yet mortal, wanders in the valleys bewailing the lot of her mortality, and the riddle of the painful earth. But the Lily of the Valley, the light Cloud of the Air, the worm of corruption, and the very clouds themselves, in turn appealed to, in turn show that she is wrong, and that nothing in the universe lives to itself or dies to itself. To complete this theodicy, she is admitted to visit her own future grave, but hears only an echo of her own complainings and retires affrighted. This conclusion is one of the odd and apparently perverse transitions common in Blake, and reminds us a little of the story of the resurrection of St. Oran, who, when expected to confirm the truths of Christianity, very ill-naturedly denied the existence of God and Heaven. The execution of Thel is in its way perfect, and has much of the singular tenderness and sweetness of

the "Songs of Innocence," as the following extract will show. The Earth is speaking:—

"O beauty of the vales of Har! we live not for ourselves.
Thou seest me, the meanest thing, and so I am indeed.
My bosom of itself is cold, and of itself is dark;
But He that loves the lowly pours his oil upon my head,
And kisses me, and binds his nuptial bands about my breast,
And says, 'Thou mother of my children, I have loved thee,
And I have given thee a crown that none can take away.'
But how this is, sweet maid, I know not, and I cannot know;
I ponder, and I cannot ponder: yet I live and love!"

Of the "Songs of Innocence and Experience," which by this time ought to be thoroughly familiar to every lover of English poetry, there is no need to say much. If they do not rise, with the exception of the Introduction to "Songs of Experience," quite so high as some of the poetical sketches, they never sink to anything like the same depth. There is an even excellence about them which is wanting in all other parts of Blake's work known to us. With the miscellaneous poems and fragments which fill pages 121-206 of this edition it is otherwise. They have in most cases their full share of their author's curious inequality, and even where there is no actual defect of workmanship, the deteriorating influence of the heresy above mentioned is often painfully apparent. The wonderful beauty of such poems as "The Mental Traveller," "Broken Love," and others across and in spite of these defects, would be proof enough, if proof were wanted, of Blake's surpassing poetical powers. We should indeed be inclined to rate "Broken Love" the highest of all Blake's poems, if it contained none but such verses as these:—

"Seven of my sweet loves thy knife
Hath bereaved of their life:
Their marble tombs I built with tears
And with cold and shadowy fears.

Seven more loves weep night and day
Round the tombs where my loves lay,
And seven more loves attend at night
Around my couch with torches bright.

And seven more loves in my bed
Crown with vine my mournful head;
Pitying and forgiving all
Thy transgressions great and small.

When wilt thou return, and view
My loves, and them in life renew?
When wilt thou return and live?
When wilt thou pity as I forgive?"

The longest of these poems, "The Everlasting Gospel," which, though never before printed in full, was pretty well known from Mr. Swinburne's book, does not, we think, fully deserve the praise which that writer and the present editor bestow upon it. It is simply a piece of controversial versification, remarkable enough as to purport, and not destitute of vigorous expression, but unworthy to be mentioned as poetry with a score of other things which Blake has written. Its inward heterodoxy will not be very shocking to people who have got over being easily shocked, but its outward huskiness cannot be very acceptable to any who prefer good prose to doubtful verse.

Lastly, we have, in five and twenty pages,

the hitherto unpublished "Tiriell." It is an Ossianic allegory, to be interpreted at discretion, not destitute of power, especially in the drawing of the central figure, who is a sort of apocalyptic Lear, but very indefinite in representing and satisfactorily disposing of the characters it introduces, and spoilt by the fatal bombast inseparable from its style. There is no passage of any length worthy of quotation, but a few detached lines and phrases will reward the careful reader.

But the value of Mr. Rossetti's edition does not so much consist in the intrinsic excellence of the additions which he has made to our knowledge, as in the increased facilities offered for studying Blake's poetry as a whole. Of the two dangers that beset this study, one is tolerably extinct. No one of any taste or culture is likely at this time of day to undervalue the genius or the work of the greatest English poet of the eighteenth century. But in the opposite direction there is much more chance of stumbling. The beauties in Blake are sometimes so transcendent, the meaning is sometimes so pregnant and subtle, that there is considerable danger of wilfully seeing beauty when there is mere deformity, and sense when there is mere nonsense. We must confess that some comments on Blake have irresistibly reminded us of the interpretative sagacity of one Thaumast, a countryman of ours, if Master Francis Rabelais may be trusted. Mr. Rossetti has, we think, hit upon (though he has not followed out) the right clue to much of Blake's writing as well as to much of his conduct, when he describes his behaviour to Hayley as that of a "naughty little boy." The curious childishness of Blake's nature, not by any means always or often taking the "naughty" form, should always be borne in mind. His delight in mere sound, often quite separated from sense, his exaggerated likes and dislikes, his abrupt transitions and discontinuities, and his total lack of any critical or analytic faculty, are all eminently childlike. They are almost necessary conditions of his peculiar excellences, his wonderful freshness and spontaneity, and the extraordinary simplicity with which his profoundest thoughts and most splendid images are delivered. No man probably ever produced such magnificent and varied effects with less complicated apparatus of language or style. Nothing is laboured or decorated; each jewel is there just as it was found in the veins of the rock. Such gems as—

"Abstinence sows sand all over
The ruddy limbs and flaming hair;"

as—

"Let age and sickness silent rob
The vineyard in the night;
But those who burn with vigorous youth
Pluck fruits before the light;"

as the exquisite "Wildflower Song," and many others, show, as it would seem, a perfect command of metre and language. But comparison soon shows us that this appearance of conscious mastery is quite delusive. It is not that Blake never revised his work; far from it: but that it was always uncertain whether the process of revision would polish or deform. The lack of critical power also explains his extraordi-

nary judgments on the work of other men. The defence, ingeniously set up, that he preferred even the bad work of a workman who in some sort went on his own principles, to the good work of another who went on principles different from his, will not cover all cases. Allowing that in this manner he might dislike Sir Joshua, what possible defence can it afford for his calling Rembrandt a fool? The fact seems to be that, as is the case with children, he was rarely without some reason for his likes, but constantly lacked all reason whatever for his dislikes. There is undoubtedly an odd tendency in the half-developed and half-cultured mind to dislike in this manner, while the attractions of such a mind are seldom wrong. Culture, which in a strict sense Blake never had, would no doubt have corrected much of this wrong-headedness, as well as much of his carelessness in work. But it would probably have restricted, in a much greater degree, his constructive and creative power. The man of culture is constantly restrained from producing by his too keen sense of the partial imperfection of his work. There is about Blake something peculiarly Adamic: he is constantly naked, but not in the least ashamed. Had he eaten of the tree which should be re-baptised of Culture, he would probably with the deformities have learnt to hide much of the beauty of his nudity.

One of the more noteworthy results of this simplicity and absence of after-thought is the lightness of touch and absence of detail which characterise his most successful works. This is the more remarkable as it is somewhat unexpected in a professor of the sister art of painting, which undoubtedly deals more in elaborate treatment than poetry. Whether this greater complication of treatment be a mark of superiority (as Mr. Hamerton, in *Thoughts about Art*, rather oddly contends), is not to our present purpose. It is certain that it exists of necessity in painting, and that it is very observable in much of the poetical work of a great living poet who is also a great painter. But it is entirely absent in Blake. Never perhaps was there a poet who dealt less in epithets, or whose epithets when he does use them are of a simpler kind, yet never was there one who succeeded more perfectly in making the common as though it were not common:

"Ah, Sunflower, weary of time,
Who countest the steps of the sun."

Here are just twelve of the commonest words, yet a hundred could not be more expressive or more pathetic. Hence it is that Blake's verses stick in the memory more persistently than other men's, their vague sweet suggestiveness compensating for the absence of elaborate imagery.

Mr. Rossetti with perfect propriety, in order to make his prefatory memoir complete, has devoted a portion of it to Blake's pictorial and prophetic work, though specimens of neither are included in the present volume. Into these subjects we shall not follow him, only echoing most heartily his expression of a hope that the prophetic books may soon be edited in a complete and accessible form. The sooner it is done the better. Meanwhile we have only to repeat our very hearty thanks to the editor for what he has given us. It is not many years

since he did his best to familiarise the English public with Whitman: he has now done in still fuller measure the same good office for Blake. We are not aware that he has any sins to answer for, but if they be not covered by these two good actions they must be a multitude indeed.

GEORGE SAINTSBURY.

A Short History of the English People. By J. R. Green, M.A. (London: Macmillan & Co., 1874.)

THOSE who have watched the industry which has of late years been engaged either in piling up materials for our national history or in the detailed investigation of single periods, are aware that the time has come when it is possible to gather up the results of so much labour. But if the hour had come, where was the man? The writer who would undertake to open once more the pages of "our fair island story" must be possessed of no ordinary qualities. Vast stores of knowledge must be combined with a habit of original research. A keen eye for the subtle threads which unite the religion, the literature, the science, the politics, and the warfare of an age, and for the rise and fall of the modes of thought by which external changes are effected, must be combined with a grasp of the concrete fact, without which the diligent student may be instructed, but the attention of the many will never be won.

To say that Mr. Green's book is better than those which have preceded it, would be to convey a very inadequate impression of its merits. It stands alone as the one general history of the country, for the sake of which all others, if young and old are wise, will be speedily and surely set aside. It is perhaps the highest praise that can be given to it, that it is impossible to discover whether it was intended for the young or for the old. The size and general look of the book, its vividness of narration, and its avoidance of abstruse argument, would place it among school books. But its fresh and original views, and its general historical power are only to be appreciated by those who have tried their own hands at writing history, and who know the enormous difficulties of the task.

It does not follow that the work is perfect. Besides such mere slips as the statement (p. 219) that the first Valois King of France was named Charles, or that Henry VI. was nine years old (p. 265) at his father's death; and setting aside all question of differences of opinion, there are not a few misstatements on points of detail in the short period with which I have tried to make myself familiar, and doubtless other investigators would be able to give a similar testimony. But it ought to be distinctly understood that a writer who undertakes to tell the whole history of our nation must make mistakes. Not having the chance of attaining to the years of Methuselah, he cannot set himself down thoroughly to master every period with which he deals. To criticise him in detail is simply to prove that after all he is a human being like the rest of us.

It is possible that Mr. Green's title may stand in the way of his early popularity. It may remind some people of those terribly

impersonal chapters on Manners and Customs which were the bane of our youth, or of those terribly personal disquisitions in which the colour of Hogarth's waistcoat is treated as equally important with the quality of Burke's philosophy or of Wesley's preaching. Mr. Green, however, aims at higher game than this. The English people he holds has a life and character of its own. Whatever illustrates that life—the literature, the religion, the social habits, the politics, the warlike deeds of Englishmen, form the subject of his pen. In the contrast with Mr. Freeman's history, which is forced on us by Mr. Green's opening chapters, we recognise at once how wide is the sweep he takes. If he says as little as he can contrive to say about battles and sieges, it is that he may have space to tell of the song of Caedmon and the prose of Baeda, to dwell upon the piety of Cuthbert, and the statesmanship of Dunstan. With all his admiration for English freedom, Mr. Green sturdily refuses to fall down and worship the house of Godwin. There was courage there, he frankly tells us, and genius for administration. Material prosperity sprang up under Harold and his father, "but it was a prosperity poor in the nobler elements of national activity;" and the Conquest was a blessing in the disguise of a curse.

For many a long year, till the Hundred Years' War with France began, England was disciplining herself, first under her foreign kings, and then under her native and adopted baronage. During this period no element of national progress escapes Mr. Green's observant eye. The thought of Anselm, the intellectual movement which produced Theobald and Becket, the rise of the towns into independence of their feudal lords, the charity of the friars, the sudden growth of the universities, the gradual formation of Parliament, are all dwelt upon with careful interest. There may be others who might have more to say on this or that subject. Mr. Green's special merit lies in the skill with which he blends the separate elements into a living whole, and brings to bear upon the point in question some apt argument from far away. No less admirable is the avoidance of exaggeration, and the careful balance of conflicting elements of character, which is especially visible in the account which he gives of Edward I.

Mr. Green's view of the Hundred Years' War as an almost unmitigated evil is probably the true one, and his account of the New Monarchy, as he terms the system which prevailed under the York and Tudor sovereigns, is worthy of deep attention:—

"If we use," he says (p. 284), "the name of the New Monarchy to express the character of the English sovereignty from the time of Edward the Fourth to the time of Elizabeth, it is because the character of the Monarchy during this period was something wholly new in our history. There is no kind of similarity between the kingship of the Old English, of the Norman, the Angevin, or the Plantagenet sovereigns, and the kingship of the Tudors. The difference between them was the result, not of any gradual development, but of a simple revolution; and it was only by a revolution that the despotism of the New Monarchy was again done away. When the lawyers of the Long Parliament fell back for their precedents of constitutional liberty to the reign of the House of

Lancaster, and silently regarded the whole period which we are about to traverse as a blank, they expressed not merely a legal truth but an historical one. What the Great Rebellion in its final result actually did was to wipe away every trace of the New Monarchy, and to take up again the thread of our political development just where it had been snapt by the Wars of the Roses."

The truth thus stated is of even greater value for the historian of the seventeenth than for the historian of the fifteenth century. But it may be asked whether Mr. Green has dealt quite fairly by this New Monarchy. He speaks of it as owing its rise partly to the destruction of the Baronage in the Wars of the Roses, partly to the selfish desire of the propertied classes to keep in awe those who were beneath them. If so, it is a unique instance of the rise of a new power out of causes purely evil, and the tales of oppression and wrong doing with which the Paston Letters abound would seem to point to a desire for justice on the part of the weak as one of the elements of the change. At all events, the view taken of the Star Chamber in the reign of Henry VII., as instituted specially for the support of the royal authority, without any regard for the suppression of abuses, is one which the prudent reader will be cautious in accepting, and will probably prefer to wait till the completion of Mr. Campbell's *Materials for a History of Henry VII.* enables him to form a more complete estimate of the reign.

Mr. Green's Henry VIII., it need hardly be said, is not the Henry VIII. of Mr. Froude. His tyranny is unrelieved by any brighter gleam, save by his love of learning, and his minister Cromwell is described as alike able and unscrupulous, carrying out the doctrines of the men of the New learning by a reign of terror. Mr. Green's weakness in this epoch is perhaps his want of sympathy with religious thought, as distinguished from religious morality, and the great work of Luther in the individualisation of the conscience receives very little appreciation by the side of the mingled comprehensiveness and tolerance of Sir Thomas More, the Falkland of the sixteenth century. Passing on to a happier time, it is impossible not to be struck with admiration at Mr. Green's masterly analysis of the character of Elizabeth. His sketch of the politics and literature of her reign ranks among the best parts of the book. His account of James is less satisfactory. The claim to divine right which Mr. Green puts in the foreground had really much less prominence in James's mind than his belief in his own sagacity. In the next reign, too, Mr. Green misses the connexion of thought between Land and the Latitudinarians, thus omitting the link which bound the men of the New learning in the sixteenth century to the Tillotsons and Lockes of a later day. Nor does he remember that the Parliamentarism which Charles I. and Cromwell combated was not the Parliamentary system of our day, or that the union of a predominant representative assembly with the organisation of Cabinet government is not the triumph of the principles of the Long Parliament, but the embodiment of that which was best in the ideas of both parties in the civil war. In a later chapter Mr. Green well points out that

the change made at the Restoration was greater in appearance than in reality; that, on the one hand, Bacon was the precursor of the founders of the Royal Society; that, on the other hand, the better influences of Puritanism survived in *Paradise Lost* and the *Pilgrim's Progress*, and leavened the religion and the morality of England when Puritanism appeared to have been struck down for ever.

Why is it that Mr. Green has so little to tell us about post-Miltonic literature? Has he nothing to say, except incidentally, about Dryden; nothing at all about Addison and Pope? When he writes of the social disorganisation of the days of the first Georges, did not his fingers tingle to write of the painter on whose canvas that disorganisation is reflected? Hume and Gibbon are alike unmentioned. It can hardly be that Mr. Green was weary of his task; and it looks as if he had been tied down by some *force majeure* upon the Procrustean bed of 820 pages. Anyhow, the loss is his readers'. They get a vivid and able narrative of the political and social progress of the nation; but the special charm of the earlier part of the volume is gone.

Even in the political part of the narrative some improvement is to be desired in the way of arrangement. The index tells us that the good side of Warren Hastings' policy will be found at pp. 759 and 760, while for the severe side we must look to pp. 760 and 761. What we find from p. 759 to p. 761 is an unmitigated panegyric, while the evil deeds of the Governor-General are relegated to p. 766, as if it were possible to understand a man's character by halves. Burke too is strangely treated. Whether Mr. Green's depreciatory view of the Whig oracle is a just one is a matter of opinion. But common justice requires that he should be introduced upon the stage in the best period of his activity, and that the sketch of his character should not be reserved for his connexion with the French Revolution.

No nation upon earth has a nobler history than England, and, as Mr. Green well says (p. 762), England has become a mother of nations.

"And to these nations she was to give not only her blood and her speech, but the freedom which she has won. It is the thought of this which flings its grandeur round the pettiest details of our story in the past. The history of France has little result beyond France itself. German or Italian history has no direct issue outside the bounds of Germany or Italy. But England is only a small part of the outcome of English history. Its greater issues lie not within the limits of the mother island, but in the destinies of nations yet to be. The struggles of her patriots, the wisdom of her statesmen, the steady love of liberty and law in her people at large, were shaping in the past of our little island the future of mankind."

Such is the story, fraught with such mighty issues, which Mr. Green has undertaken to tell. He would be himself the last to deny that his work is not without deficiencies. But no candid reader can finish its perusal without discovering that the theme has at last found an exponent worthy of its grandeur.

SAMUEL R. GARDINER.

A Quiet Corner of England: Studies of Landscape and Architecture in Winchelsea, Rye, and the Romney Marsh. By Basil Champneys, B.A., Architect. With numerous Illustrations by Alfred Dawson. (London: Seeley, Jackson, & Halliday, 1874.)

"A BUILDING," says Mr. Champneys, "can never be like a picture, complete within the limits of its frame and independent of influences beyond. It must be studied upon its own site, and under all the conditions of history, landscape and neighbourhood." We may amplify this idea a little, or rather put it in terms a little more general: The author wishes people to look at what they see with their eyes open, and not isolate special things artificially, and look at these only to the exclusion of the others. He is not one of those who say they are looking at a church when they are looking, in truth, at a church complicated with a confusion of roofs and chimneys, connecting itself naturally with the sweep of the street that leads up to it, and relieved against the blue distance and the bright sky on the horizon. A building is a building, indeed, but it is much more. It makes or mars the landscape, it completes or nullifies the profile of a town upon a hill top. I have in my eye two notable instances. In one, a block of high barracks, built in late days upon the battlements of an old citadel, falls admirably into harmony with the situation, and carries up into the sky-line the sentiment of the steep rock on which the place is founded; so that, although a common-place structure in itself, it has become the most impressive, and I had almost said the most romantic, feature in the pile. In the other, a monumental tower of some architectural pretensions has been put upon a poor little hill, the last buttress of a grand wall of mountains; and those who remember the hill before it was thus burthened, the whole scene before it was thus burlesqued and stultified, can alone appreciate the evil that has been effected.

The most delicate shades of relation may be traced between the sentiment of a building and the sentiment of its surroundings. And in no place is this relation so delicate and amiable, at least for Englishmen, as in quiet corners of England, such as the one Mr. Champneys has set himself to realise for us. He was moved, he tells us, by "a jealous desire that the modest and homely landscape and architecture of our own country should receive more general appreciation." He has been justly irritated at that very pinchbeck and indiscriminating enthusiasm which inspires so many of the readers of the Continental Bradshaw, and the followers after Mr. Cook.

"Those," he says, "whose association with either landscape or art is more or less occasional, naturally find grandeur more effective than modesty, scale more easy to appreciate than sentiment. But such emotions as are engendered exclusively by gorgeous effects are apt to be sensational, and are neither so wholesome nor so enduring as those which arise in a quiet and homely atmosphere. Moreover, familiarity with the more specious is apt to render the more modest permanently insipid."

There is a great deal of truth in this, and yet I should be inclined to regard this ex-

clusive preference for Alps and Pyramids as entirely exotic to the heart of Englishmen. If this taste has grown up among us, it is because an enemy came by night and sowed it—many enemies rather: the whole generation of small poets and small romantic travellers—and because better husbandmen have been remiss and let the good seed lie idle. And so we may have all hope of the ultimate success of books such as this, and the better spirit of which they are the sign. The English are a docile people in such matters: they will gladly learn from Mr. Champneys that there is a sentiment in Romney Marsh as well as in the Pyrenees; this acquisition will make it an easier task for someone else to prove to them the beauty of some other out-of-the-way corner or beaten track; and so, line upon line, precept upon precept, they will become intelligently reconciled to the fashion of their own country, and learn, perhaps, some more refined conception of natural loveliness than a very big hill of no particular shape with some white snow upon the top of it.

The district chosen by Mr. Champneys is one of somewhat romantic geographical conditions. Out of a bay on the old coast line, still strongly marked and easily recognisable for a coast line, the sea has gone back step by step, leaving behind it a great flat. This flat is the Romney Marsh. The chief note of the district is its amphibiousness; and this is capitally realised for us in the book. Traces of the retiring waters are nowhere wanting. You can recognise what was once an island by the constrained grouping together of trees and houses; and what was once an estuary or lagoon, by bridges and stepping-stones now left high and dry for ever. On the horizon, ships in full sail seem mixed together with stationary trees and haystacks.

"The more subtle effects," says Mr. Champneys, "are as those upon the sea. You see the storm gathering in the distance, and it sweeps over the equal ground self-contained, solid and detached, neither distorted nor delayed by any prominence; the wind blows steady and undiverted; and the countryman, who shows you a circuitous path to some distant object on the open plain, has some story to tell of former perils by sea. The farmers keep a few boats, and the retired sailors become farmers or farm labourers, and the old houses far inland are specially and elaborately planned for hiding smugglers and smuggled goods. Moreover, the sea, though from the dead level it is actually unseen, is constantly present to the imagination as a haunting influence, and to the senses as a bright horizon of reflected light; and the sea-shore is marked here and there by a few whitewashed cottages and a flagstaff."

This is very good, and there is more of a like quality. Altogether, what with Mr. Champneys's description and some of Mr. Dawson's illustrations,—that, for instance, opposite page 12, and that at the foot of page 61—Romney Marsh becomes very distinct and familiar to our minds before we have finished the little volume.

Of the various buildings that are brought out for us against this background, the various bits of architectural detail criticised—architectural detail of all sorts and descriptions, down to the carpentry of certain prison doors at Rye, and a glazed cupboard from the inn at New Romney—I

propose to say nothing. There is much to interest the reader: and here again some of Mr. Dawson's etchings are worthy of all praise. But one must avoid falling into the manner of those *critiques de critiques* that have stirred the scorn of Baudelaire, and many others who had a better right, perhaps, to be scornful in such a case. So, without entering into any of the more particular points here dealt with, it will be enough to say that all the criticism bears the stamp of strong personality. Mr. Champneys is no more open to all the pleasurable details of art than angry against those whom he considers as Art's banded enemies, and he is a very plain dealer when angry. Indeed, some of the most entertaining passages of the volume are those in which he has suffered his righteous indignation to carry him away, and refers, with truculent irony, to "the refined and interesting zeal of Protestantism," or regrets the rashness which led him to "anticipate that a Conservative Government would extend to our most valuable monuments some portion of that tenderness which it is supposed to show for abuses."

ROBERT LOUIS STEVENSON.

Revue de Droit International et de Législation Comparée: Organe de l'Institut de Droit International. (Londres: Williams et Norgate, 1869-74.)

THIS widely-circulated Review has nearly completed its sixth year, and it is not too much to say of it, that in each successive year of its publication it has established fresh claims to the gratitude of the jurist and to the thoughtful attention of statesmen. It was commenced in 1869 with the twofold object of encouraging, on the one hand, the study of comparative legislation as the best preparation for the study of international law, and of assisting, on the other hand, to form a sound public opinion on matters of international law by a calm and serious discussion of various topics within the province of that law, with a view to make known its anomalies and defects, and to bring about a *consensus gentium* as to the proper mode of remedying them:—

"By public opinion," we translate the words of M. G. Rolin-Jacquemyns, one of the founders of the Review, "we do not mean those undulating and ephemeral phases of thought, which express for the moment the passion, the interest, the prejudices of the day, coupled with an imperfect knowledge of facts; but a serious and calm tone of public thought, founded on the application of certain principles of universal justice to constant events. . . . Such a public opinion," he adds afterwards, "as becomes the judgment of history, and in matters of international law is the progressive expression of that natural right, which Grotius has so well described as 'the dictate of right reason, assigning to each act a character of moral necessity or moral turpitude, according as it is conformable or not to the reasonable nature of man, and consequently is enjoined or forbidden by the Author of Nature.'"

The founders of the Review were M. G. Rolin-Jacquemyns, of Ghent, whose name has been already mentioned; Professor T. M. C. Asser, of Amsterdam, and Mr. John Westlake, Q.C., of Lincoln's Inn, whose writings on private international law are well known to English lawyers. The oppor-

tunity of its appearance was confirmed by the fact that the third number of the Review presented a list of 120 jurists and publicists, among whom are to be found some of the most distinguished names in Europe and in America, who promised their co-operation in the enterprise, and whose promises have been well maintained. Each number of the Review contains from six to eight original treatises, which fulfil one or other of the objects specified in the introductory notice above alluded to. In addition to these original treatises there is to be found in each volume an Annual Chronicle of Comparative Legislation, in other words, an annual notice of the principal statutes and ordinances promulgated in each year in the various States of Europe and America which are of interest to other countries. This chronicle has been undertaken by Professor Asser, while M. G. Rolin-Jacquemyns supplies a corresponding Chronicle of International Law. Each number further contains a careful notice of the more important publications on legal subjects, which have appeared from time to time in Europe and in America; and although Asia has not as yet put forth any claim to be noticed under this list, it is a fact worthy of remark, and it has not escaped observation in the Review, that Wheaton's *Elements of International Law* have been translated into the Japanese and the Chinese languages, and that the Chinese Government has officially adopted the work of Mr. Wheaton as an authority on all doubtful cases of international law. Further, the Review in its first number for 1873 contains a communication from Dr. W. A. P. Martin, Professor at the Imperial College at Peking, from which it appears probable that the treatise of Dr. Woolsey, of Boston, U.S., on the Study of International Law, has been approved as a text-book by the University of Peking. There can be no doubt that European ideas on public law are rapidly gaining hold of the Asiatic mind, and that the European nations must be prepared soon to welcome the Asiatic nations to a place within the same international circle, into which the Ottoman Porte was formally admitted by the Treaty of Paris of 1856. Dr. Martin states that the chief statesmen in China are well aware of the fact, that it is to the principles of public law, which are recognised amongst the nations of Europe, that their country owes its comparative security from foreign aggression.

In addition to the above-mentioned subjects, the Review supplies an Annual Bulletin of the more important decisions of the Belgian and French Courts on questions of international law. These bulletins were commenced in 1872, and have been continued to the present time. Digests also of German, English, and Italian judgments on a like class of questions have been commenced; and it may be expected, when the circle of these bulletins and digests is complete, that they will materially help to stimulate the growth of a branch of legal science which is still in its infancy—that of Comparative Jurisprudence. Mr. Justice Story may justly be considered to have laid the foundation of such a science by his well-known work on the Conflict of Laws, but there is a large field of juridical conflict

in Europe, the true character of which can only be analysed by the light of judicial decisions, which require to be brought together under circumstances which make an accurate comparison of them possible—such a comparison, indeed, as will pave the way to the discovery of common principles which underlie those decisions, and upon which an harmonious system of law may be built up.

It has been observed that the promises of support to the Review on the part of a considerable number of the leading jurists of Europe and of America have been well maintained; and first of all as regards comparative legislation, there is hardly any country of Europe, in which any great improvement of its civil or criminal code has taken place, of which the Review does not supply a careful exposition. And if the student of jurisprudence is disposed to pass beyond the limits of Europe, he will find in the Review a synopsis of the new Civil Code of the Argentine Republic; a critical examination of the new Civil Code of Mexico; and an analysis of the scheme of judicial reform, which has been for some time contemplated by the Khedive of Egypt in consultation with the European Powers, and which has been recently carried into execution according to the information supplied by the public journals. The reform contemplated under this scheme may be regarded as an important step in the assimilation of the jurisprudence of the Eastern world to that of Europe, and in no country can such a reform be initiated with greater fitness and with greater chances of success than in Egypt, which marches in the van of Mohammedan civilisation, and which has by a bold innovation succeeded in constituting herself the highway of international commerce between Europe and the far East.

It was to be expected that the great changes which have been effected in the territorial distribution of Europe, by the erection of the kingdom of Italy in the first place, and subsequently by the establishment of the new German Empire, should have caused a great fermentation of ideas on subjects of International Law, and have created a desire among nations to live more under a common law than heretofore. In addition, the removal of ancient barriers against international commerce consequent on the application of steam-power to locomotion, and of electricity to the intercommunication of thought, has done much to realise the idea among nations that they are members of a common family, and the governments have wisely placed themselves at the head of the movement. Treaties of navigation and of commerce have been multiplied, conventions have been negotiated on the subjects of naturalisation and of extradition, international arrangements have been entered into respecting postal and telegraphic communication, common rules of navigation and common signals to be used at sea have been agreed upon, and international patent laws for the encouragement of mechanical science and of literary genius are under consideration. These are novel and brilliant trophies of peace, to which modern diplomacy may point with just pride, which, however, would not have been attainable if the pulse of in-

ternational sympathy had not beat strong in the hearts of the peoples. M. G. Rolin-Jaequemyns, in the third number of the Review for 1873, has called attention to these remarkable features of the times, and to the expediency of invoking the scientific co-operation of jurists in aid of diplomacy and in support of the efforts which have hitherto been made by isolated writers to regulate international relations by general rules, which should go beyond the political necessities of the moment:—

“In our opinion” (we translate the words of M. G. Rolin-Jaequemyns) “it is to the Science of Law that it appertains to determine, not at any one time, nor in a moment of enthusiasm, but slowly, by force of research and reflection, the course which the present movement should take. In other words, it is for the Science of Law to organise its own collective action. The spirit to which it must appeal is not that of the Abbé St. Pierre, but that of Grotius, whose solid good sense kept in view above all things the realisation of justice within the limits of possibility. Besides, serious science, which studies, compares, takes account of facts, of history, of the natural laws which preside over the existence and the development of peoples, is already a force eminently pacific. It has been observed by a distinguished French statesman that science unites mankind; passion and caprice divide them. In politics, science is able to diminish the disagreement, and to contribute to that concord of intelligent minds, which constitutes the domestic happiness of a people, and its external power. It suggests at the same time motives for transient and necessary submission, and reasons for future hopes. It teaches what is true, and thereby furnishes the measure of what is possible.”

“In conclusion,” adds M. G. Rolin-Jaequemyns, “in order to organise a collective scientific action on the subject of international law, the moment appears to have arrived for founding a permanent institution of a purely scientific character, which, without proposing the realisation of a distant Utopia or a sudden reform of an existing order of things, may nevertheless aspire to be the organ of the judicial conscience of the civilised world within the domain of international law.”

Such an institution has been in effect founded in the autumn of 1873 by a congress of European and American jurists, assembled at Ghent, of which the Review has been constituted the official organ, and which has adopted the title of “The Institute of International Law.” Its president is Professor Mancini, of the University of Rome, an eminent member of the Italian Parliament; and its vice-presidents are Dr. Bluntschli, Professor of Law in the University of Heidelberg, and the distinguished French statesman above alluded to, M. Esquirol de Parieu, Member of the Institute of France, and formerly President of the Council of State. Its secretary-general is M. G. Rolin-Jaequemyns, of Ghent, already mentioned as one of the founders of the Review, and whose exertions have materially contributed to the assembling of the Congress. The effective members of the Institute are limited in number to fifty, and the conditions of membership are set out in the fourth number of the Review for 1873. It has met once since its original organisation, and its sittings on that occasion were held at Geneva, in the same historical chamber of the Council of State of the Canton, in which the Arbitrators under the Treaty of Washington of 1871 held their deliberations; and by an

auspicious coincidence, a Code of Procedure for the Conduct of International Arbitrations, which has been prepared by Professor Goldschmidt, Councillor of the Supreme Commercial Court of the German Empire, was the first subject taken into consideration. The proposed code underwent a long and careful discussion, and the suggested amendments have not as yet been finally approved by the Institute. The original draft of it has been printed in the October number of the Review for the present year, and it well deserves the attention of statesmen, as it is a carefully prepared scheme for regulating the conduct of international arbitrations by a code of general rules, which has latterly become a *desideratum* in diplomacy, inasmuch as it is now the usual practice in treaties of commerce and navigation, and in other treaties intended to facilitate international intercourse, to insert a provision to the effect that all differences as to the proper interpretation of the treaties shall be settled by arbitration. That a code of general rules for the conduct of such arbitrations will be welcome to diplomatists may be inferred from what occurred in a preliminary stage of the late arbitration under the Treaty of Washington. The arbitrators found themselves embarked without a compass on an unknown sea, in which each had to guide his course by the polar star of his own conscience, and the first rock, upon which their mission might have suffered shipwreck, was the objection that they were not competent to decide upon their own competency. This question they indirectly determined in the affirmative, and with reason in our opinion, inasmuch as they were the representatives of independent states, and the circumstance of their acting collectively could not derogate from the full power, with which each member of the Congress was individually invested to do whatever was necessary for the complete execution of his mission. Dr. Goldschmidt has adopted a direct rule to the same effect in his proposed Code of Procedure, by the eighteenth article of which it is laid down that the Tribunal of Arbitration is judge of its own competency. We cannot afford space to examine Dr. Goldschmidt's proposed code in its details, and it would be premature so to do, as it has not as yet been finally approved by the Institute. A further memoir has also been printed in the same number of the Review, which was submitted to the Institute by M. Charles Calvo, formerly Minister Resident of the Argentine Republic in Paris, and the author of a well-known treatise on International Law. It is entitled “An Examination of the Three Rules of International Law propounded in the Treaty of Washington.” This memoir contains a very complete review of all the circumstances which led up to that Treaty, and of the proceedings under the Treaty, and of the discussions in the British Parliament subsequent to the award of the arbitrators. It further contains an historical summary of all the leading cases in which the conduct of neutral states has been impeached in recent times on the ground of their neglect to enforce their own laws for the maintenance of neutrality, with the opinions of various publicists of the present century, who have occupied

themselves with the same question. We commend this treatise to the attention of statesmen, with the observation that the Treaty of Washington of 1871 ought to serve as a beacon to governments, to warn them against attempting to introduce into international relations fixed principles hastily embodied in formal rules, which have been devised to meet the political necessities of the moment, but of which the uncertainty is disclosed on their first application to the settlement of an international dispute.

TRAVERS TWISS.

Under the Southern Cross; a Tale of the New World. By the Author of the "Spanish Brothers," &c. In One Volume. (Edinburgh and London: T. Nelson & Sons, 1874.)

The Last Inca; or, the Story of Tupac Amaru. In Three Volumes. (London: Tinsley Brothers, 1874.)

It is a very difficult literary feat to write an historical romance so as to secure the attention and interest of ordinary readers. The adoption of this form of composition seems justifiable when the object is to convey information respecting the history of remarkable events in distant countries, where names of places and people are unfamiliar. A useful end may thus be obtained by skilful treatment, if the author is intimately acquainted with his subject in all its bearings. But topographical and historical accuracy as regards all the main points is essential; and the interest must be kept up less by dialogues than by picturesque descriptions and incidents, and by the dramatic unity of the plot. For there can be no use in an historical romance unless to convey information in an agreeable and interesting form which might otherwise be wearisome and distasteful.

An excellent example of what an historical romance should be will be found in *Akbar*, a volume by Mr. van Limburg Brouwer, published at the Hague in 1872. The reader here obtains, in a pleasantly written narrative, all the information which he must otherwise seek for in the formidable pages of Ferishtah and the Ayin Akbari. The scepticism of the great emperor, the mystic notions of Feizi, the arguments of Aquaviva and other advocates of special forms of religious belief, come out in the course of a pleasant story in which customs, manners, and scenery are very correctly delineated.

The land of the Yncas has before now been selected as the scene for very absurd romances, both by English and French authors; and the two books now before us prove the interest which is still taken in Peruvian history. But they are of very unequal merit.

Under the Southern Cross is excellent of its kind. The authoress is not personally acquainted with the people and the country of which she writes; but she has succeeded, through her love for the subject and by diligent research, in securing to a very lively and pleasantly told story, full of incident and in which the interest is admirably sustained, an accuracy in all historical and topographical details which is really very remarkable. We have only detected two trifling mistakes in the whole volume.

Under the Southern Cross is a story such as young people delight in, belonging to a class of which *Westward Ho!* is the type. The interest is well sustained as the plot is developed; and, in seeking and finding amusement, the English reader will acquire much accurate historical information, and a generally correct notion of the physical aspect of a distant country. The time selected is that immediately after the Spanish conquest.

The Last Inca is very different. The author has written a dreary and uninteresting three-volume novel of the ordinary type, through which it is most weary labour to wade; while the historical events on which it is professedly based form but a small part of the prolix narrative, and are inaccurately told. The author is evidently a smatterer who wishes to be taken for a student, and it is provoking that he should have chosen to write upon a subject such as that of the insurrection of Tupac Amaru, which has not yet been fully investigated, and which is of such intense interest in itself. There is internal evidence that the writer has looked over some of the *Papeles Varios* in the library at Lima, and that he has read some of the ordinary books on Peru; but to the more important works, such as Garcilasso, he makes imaginary references, and he evidently has never even seen the documents which contain the history of Tupac Amaru. He tells us that he has travelled over the whole extent of Peru, but he must have given a very wide berth to the neighbourhood of Cuzco, the scene of Tupac Amaru's exploits, of which he knows nothing. Thus he thinks that Chayanta, which is hundreds of miles away in Bolivia, was in the province of Tinta, near Cuzco; he talks about the Cacique of Pumacagua, when Pumacagua was a chief's name; of Vilcañuta meaning "holy height," which is quite wrong, and of its being viewed by climbing up to the *Cusipata*, or "hill of joy;" the *Cusi-pata* being the name of the great square of Cuzco, from which the peak is not visible. Of Tungasuca and its neighbourhood, the home of Tupac Amaru, he has the most erroneous idea, and can never either have seen the place or have read a description of it; and he talks of forests and coca-plantations in Quispi-cancha, a district near Cuzco, far above the zone of either forests or coca. His idea of Paucartambo is equally erroneous. His bad spelling also betrays a want of acquaintance with the subject concerning which he writes. He has *Puno* for *Puna*, *Chincero* for *Chincheru*, *Surinani* for *Surimana*. He talks of Aymaraes, a district to the west of Cuzco, being 120 miles to the south-east; and of Lampa, which is 150 miles south of Cuzco, being only twenty miles from that city. These are only a few instances of blunders, which show that the author's journeys in Peru did not take him to the scenes of events concerning which he has chosen to write. The book is dull and inaccurate, two inexcusable faults in an historical romance.

We trust that the stories of Tupac Amaru, of Pumacagua, and of other patriots among the Ynca Indians, may some day find a better exponent; for they are full of incidents of romantic interest, the materials are abundant

and authentic, and their historical value, involving as they do the destinies of a once powerful and civilised race, is great and indubitable.

CLEMENTS R. MARKHAM.

CURRENT LITERATURE.

Tales in Political Economy. By Millicent Garrett Fawcett. (Macmillan.) Mrs. Fawcett apologises to Miss Martineau for plagiarism of her idea of "hiding the powder, Political Economy, in the raspberry jam of a story;" but these tales differ in one essential respect from their celebrated prototypes. Miss Martineau's object was edification; her tales were as one-sided as a tract, but had each a direct practical moral, and so everyone who admitted that her pictures of workhouse life and agricultural distress were drawn without exaggeration from real possibilities, was forced to concede that such things ought not to be even possible. Mrs. Fawcett, on the other hand, proposes simply to instruct: her tales are like those allegories in which articles of the true faith are somehow supposed to become more intelligible and attractive when a type of human appetite or error is substituted for the prosaic general name, and credited with such adventures as may befall a type. The first tale is not original, and rather dull; it tells how the inhabitants of an undiscovered island near Sumatra were governed by an hereditary aristocracy, owning all the trees producing palm-oil, which was the principal natural product of the country; to secure a market for their oil, all the subject population was forbidden the light of day within their huts. The arguments by which the discoverer of the island endeavours to convince them of the folly of this arrangement may be imagined: the only application suggested is to the protection of beet-root sugar in France, a subject which Miss Martineau would have treated in the concrete, showing us, with all the pathos of which the case admitted, how the children and innocent adults of a well-disposed French village suffer from being kept on short commons of sugar, with perhaps a digression to the untimely end of the conscript, who might never have taken to cigars and absinthe if his natural appetite for lollipops had not been tyrannously kept from indulgence. The other three tales are continuous, and relate the economical progress of a party of shipwrecked sailors, who begin with a chance distribution of property (salvage from the wreck) on the principle "finding's keeping," gradually settle into a division of labour which contents everybody except a Mr. Davies (like the nobleman in *Sandford and Merton*), who is imbued with the belief that unproductive consumption or expenditure is "good for trade." This episode suggests that satire is scarcely Mrs. Fawcett's forte, because it is an essential part of the economical heresy which she wishes to ridicule, to regard the providential utility of extravagance as one of the blessings developed by an advanced civilisation. Mr. Davies would not know exactly at which stage of national growth he supposes it to become visible, but he would certainly not expect to reap the benefit of it when cast back into natural barbarism on a desert island. The account of the beginnings of domestic trade, the introduction of money and the subsequent commercial intercourse with San Francisco, might perhaps serve its purpose of helping national or other school children to comprehend and remember portions of the author's *Catechism of Political Economy for Beginners*, but there is always the danger of leaving out some material consideration when problems are stated with artificial simplicity, and it should, perhaps, have been pointed out towards the end that, though the wealth of a whole nation, as compared with its neighbours, cannot be increased by trade in which coin alone is received in exchange for commodities, the followers of particular industries, by engaging in such trade, are as much enriched as

the first finders of the chest of gold and silver at Isle Pleasant.

THE title of the *Pepperrell Papers; with Sketches of Lieut.-Gen. the Hon. James St. Clair and Admiral Sir Charles Knowles, Bart.* (Boston), is deceptive. In a footnote the editor regrets that "the public and private correspondence and other papers of Sir William Pepperrell should ever have been scattered, or any portion of them destroyed. Their fate is another illustration of the insecurity that attends private collections, no matter how valuable, unless they are placed in the custody of some institution whose existence is not subject to the ordinary accidents of a single life, or the caprices of a single will. Is it too much to hope that before many years elapse all the *Pepperrell Papers* will come together? It will make but little difference what depository is selected, provided it be safe and accessible." This expression of regret may serve as a suggestion for the establishment of a United States Record Office, but it hardly justifies the collection of four letters of little or no historical interest, to be grandly styled the *Pepperrell Papers*. Sir William Pepperrell, an American merchant, who for thirty-two years was a member of the Council of Massachusetts, and in 1745 commanded the expedition against Louisbourg, played no unimportant part in the history of New England during the middle of the last century; and the student or general reader, in opening this brochure, may from its title expect to find the various letters written and received by Sir William during his long tenure of office. He will be disappointed. All that will meet his eye will be two letters of Christopher Kilby, the agent to Massachusetts, one of Sir William Pepperrell, and a copy of the instructions delivered by General Braddock to Colonel Shirley. Nor do we see much reason why this scanty instalment to our MS. literature should ever have reached the light. We are told that the Papers contain facts that have never before appeared in print; but the importance of a fact does not consist in its previous exclusion from print, but in the value it possesses in relation to other matters. Now, the "facts" contained in this attenuated edition of the *Pepperrell Papers* are of a very trifling nature, and historical information is not a whit increased by their publication. And yet the pamphlet is not without a certain value. The sketches of James St. Clair and of Admiral Sir Charles Knowles, written by the editor, are new and well done. Considering the career of these two distinguished commanders in the expedition to Canada of 1746, and their subsequent lives of active military service, it seems strange that biography should have omitted to remember their names. The selection of these *Pepperrell Papers* has but served the editor as a text whereon to hang a couple of biographical notices which are readable, and contain matter not to be found elsewhere. With his sketches of St. Clair and Knowles we have no fault; it is only the comprehensive title accorded to a scanty collection, and the weakness of the collection when made, that displeases us.

The Shakespeare Birthday Book. (Messrs. Hatchards). We have at last got the right sort of birthday book. It has been a trial of patience to be called upon to write our names opposite some inapplicable or even denunciatory text, or some feeble extract of verse; but Messrs. Hatchard have just brought out an attractive little volume interleaved, with one or more quotations from Shakespeare for every day in the year. The compiler has evidently chosen these quotations to suit his or her friends, but the good wishes and sound advice chosen for the few are for the most part applicable to the many. To those who care to collect their friends' autographs in this way, we can recommend this pretty little book.

The House on Wheels; or, Far From Home. From the French of Mme. de Stolz, by M. d'Anvers. (Sampson Low.) This is a graphic, sprightly, and interesting French tale, which reminds us of

the class of stories we used to ask for in our childhood, "all about running away, and gipsies, and getting lost, and that sort of thing." A little boy called Adalbert strays away from his father in the town of Prague, and is stolen by gipsies. His adventures in the travelling caravan, which is the "House on Wheels," his terrible misfortunes and the final escape, make up an exciting story, and will be listened to with intense interest round many a Christmas fire. The "twenty full-page illustrations" are startling in their character, and calculated to strike awe into a timid child, especially the one, to face p. 48, of the gaunt old gipsy with the shears in her hands.

Speaking Likenesses. By Christina Rossetti. With Pictures Thereof by Arthur Hughes. (Macmillan & Co.) This will probably be one of the most popular children's books this winter. We wish we could understand it. It is very pretty; the pictures are charming, especially the one on p. 19, where Flora's little hand is grasped by the knocker, and the one on p. 61, where Edith has taken the tea-kettle into the wood; but we have an uncomfortable feeling that a great deal more is meant than appears on the surface, and that every part of it ought to mean something if we only knew what it was. The good old fairy tales of our childhood had no moral, or if they had, it was put in a separate place at the end, with the word Moral printed over it very distinctly, and then we knew where we were; but the present-day fairy-tales fatigue us, because we feel we ought always to be watching for some hidden joke or deep meaning. The same remark applies to a book that is in many respects charming—the *Princess of Silverland and other Stories*, by Elsie Strivelyne. (Macmillan & Co.) The first two stories are very graceful: the Princess who goes up into the Snowland to look for her heart, and only discovers it by the love of the Prince, has some resemblance to Undine; but her story is beautifully told, and "Elsie's Rides" are original and thoroughly enjoyable. A passage quoted from her ride with Moonbeam will show how pleasantly the whole is written:—

"Elsie did not feel sorry, therefore, when Moonbeam hurried her away past the mouth of a shallow river, where she could hear the water-sprites laughing as they clattered over the stones on their way to an evening party on the lake. 'We are going to the place where the water comes from,' said Moonbeam, and the ponies tore along between the thick trees that dotted either bank of the hurrying stream.

"It was a hill that towered above them and the higher they rode the larer it grew. Elsie hardly knew which went quickest, the stream—a small one now—leaping with a shout down the rocks, or she leaping and bounding upwards. It was glorious, brushing over the dewy bloom of the heather, sweeping silvery drops off the tossing birches, laughing to the water that laughed back to her, and feeling the air become fresher and clearer as they rose. Soon, however, the stream grew quieter, and it seemed that Moonbeam too was stiller, so that Elsie herself ceased to laugh. They were close to the top of the hill now; a long stretch of grey waving grass, with here and there deep swamps and rushes. 'This is one of our wide places, Elsie,' said Moonbeam, softly; 'listen and you will hear the whisper of the waters gathering among the rushes to go out to the world below the hills.' Pausing to hearken, Elsie heard tender voices chanting the

SONG OF THE WATER DROPS.

'Drip, drip, we come and go
With patient footsteps soft and slow,
Where the wildest breezes blow,
Where the greenest rushes grow,
Where the asphodel's a-blow;
Gathering, whispering, to and fro,
Drip, drip, we come and go.'

It is a pity the whole book is not made up of stories about Elsie. The "Christmas Party" is rather dull, and in "Uncle Willie's Fairy Tale" we again get that uncomfortable sensation of listening to a

sermon, and not knowing what we have done to deserve it.

Moon Folk. By Jane G. Austin. (New York: Putnam & Sons.) This book comes to us from America and is beautifully got up. The misty moonlight pictures are very amusing, but the story is heavy and forced, and we do not quite fancy meeting the ghosts of the fairy-tales of long ago. The little heroine Rhoda is taken by the Chimney-Elf to the moon, and there she meets all the people in the nursery rhymes, and in all the fairy-tales from Cinderella to the Morte d'Arthur, and they say things with double meanings that we are quite sure they never would have said, and we begin to be nervous lest any of our old favourites should disgrace themselves, so that we are truly thankful when little Rhoda comes home again, and goes to bed quietly.

The Children's Band. By Hon. Isabel Plunket. (Warne & Co.) This is a religious story, based on one of the popular hymns of the day. The writing has a strength and graphic power about it which shows that the author is capable of more sustained work. The book will probably be very popular as a reward in Sunday Schools, being well printed and prettily illustrated.

Christabelle, a Tale of Christmas; and other Poems. By Aura. (Longmans & Co.) We are at a loss for the *raison d'être* of this book, unless it is an advertisement of the autotype process, of which it contains a beautiful specimen as frontispiece. EDITOR.

NOTES AND NEWS.

ARRANGEMENTS have been made by the India Office authorities for the publication of the journal kept by Mr. Robert Bogle (the only Englishman who was ever at Lhasa) during his stay in Tibet. Mr. Bogle was deputed, in 1774, by Warren Hastings on a mission to the Lama of Tibet, with instructions to endeavour to effect the very object after which the Indian Government are still striving—i. e., the opening, or rather resuscitation, of trade between Bengal and Tibet. Mr. Bogle made a great impression on the Lama, who arranged to meet him the following year in Peking, whither his Holiness intended to proceed. Unfortunately for the interests of British Indian commerce, both the Lama and Mr. Bogle died the same year. Mr. Bogle's journal, probably on account of the death of its owner, remained unpublished; and the only copy believed to be in existence has just been accidentally unearthed from among the Additional MSS. of the British Museum. It is to appear *in extenso*, with an introduction giving a review of European connexion with Tibet, and will be illustrated by a map showing the various trade routes leading into the country.

A TRANSLATION of Professor F. A. Lange's *Geschichte des Materialismus* is in preparation by Mr. Ernest C. Thomas, of Trinity College, Oxford, and the first volume may be expected some time in the coming year.

WE learn that the Duke of Northumberland has opened his large and important collection of family papers, preserved at Sion House, Isleworth, to the inspection of the Historical MSS. Commissioners.

M. CLERMONT-GANNEAU has terminated for the present his engagement with the Committee of the Palestine Exploration Fund, his year of leave from the French Foreign Office having expired. He brings home with him a large quantity of notes, sketches and inscriptions, which will be published in the paper of the Fund.

MESSRS. LONGMANS announce for publication in December: Earl Russell's *Recollections and Suggestions of Public Life*; the second volume of Messrs. Green and Grose's edition of *Hume's Essays*; the second volume of Mr. B. Jerrold's *Life of Napoleon III.*; and the third edition of Sir A. Grant's *Ethics of Aristotle*. They have also in the press: *Fragmentary Papers*, by the

late Sir H. Holland; *Studies from Genoese History*, by G. B. Malleson; *Spain: Art-Remains and Art-Realities; Painters, Priests and Princes*, by H. W. Baxley; *The Seventh Great Oriental Monarchy*, by Professor Rawlinson; *Isaac Casaubon*, by Mark Pattison; *Poems*, by W. B. Scott; and a *Primer of the English Constitution and Government*, by Professor Sheldon Amos.

DR. ROLLESTON has presented to the Bodleian Library an Atlas of England which bears on the first page the signature of Hen. Bradshaw Graienseis. T. D. W[hitaker] wrote on the second page:—

"This volume appears to have belonged to the infamous Regicide John Bradshaw. It was brought out of the library at Marple, and the name Henry Bradshaw on the opposite page is in the Hand Writing of his nephew, Henry Bradshaw, of Marple and of Gray's Inn, to whom his uncle, by will dated , bequeathed 'all his lawe bookes and such divinitie history and other bookes' as she (his wife and executrix) shall see fitt for him. The divinitie bookes of John Bradshawe!!!"

A VOLUME in aid of Christian apologetics, consisting of essays by the Rev. Drs. C. S. Henry, Hugh Miller Thompson, E. A. Washburn, Joseph H. Rylance (late Dean of Chicago), William R. Huntington, T. M. Clark (Bishop of Rhode Island), and John Cotton Smith, has just been issued in New York. It bears the title of *Christian Thought and Modern Opinion*, but the several papers which it embraces appear to have been written prior to the publication of Mr. John Stuart Mill's posthumous work on Religion, and hence only indirectly answer it as the questions to which Mr. Mill's speculations relate are incidentally traversed. The book has no London publisher.

MR. S. R. VAN CAMPEN, an American author of Dutch descent, who has been engaged for some years past upon the literature of Holland, at the British Museum, is now engaged on a new undertaking, in the form of an historical biography of the "Three Netherland Kings" of the Nassau-Orange line.

BEN JONSON'S works, as edited by Gifford in 1816, are to be reprinted in large type by Bickers and Son, of Leicester Square. Lieut.-Col. Cunningham's introduction and appendices—his old ones, we presume—will be added to the book, which will form nine volumes demy octavo, and will be published at five guineas. Fifty copies will be printed on superfine hand-made paper, at twelve guineas the set, half-bound in Roxburghe style.

MESSRS. EDMONSTON AND DOUGLAS will shortly publish a reproduction in facsimile of the rare series of forty plates, each 14 by 12, engraved by Nicolas Hogenberg, commemorating the procession of Pope Clement VII. and the Emperor Charles V. after the Coronation at Bologna, 24th February, 1530. Prefixed will be an historical introduction by Sir William Stirling-Maxwell, illustrated by various contemporary portraits of the Pope and the Emperor, ornamental designs from books of the sixteenth century, portions in facsimile, on a somewhat reduced scale, of the rare Venetian woodcut of the entry of Charles V. into Bologna on the 5th of November, 1529, and the whole of the procession after the coronation, as engraved by Comerio after Brusasorci's frieze in the Ridolfi Palace at Verona; and a facsimile of the principal group in the procession, as cut in wood by Robert Peril at Antwerp in 1530—a print so rare that only one impression, that in the Museum at Antwerp, is known.

THE completion of the sixth volume of that most energetic of local societies, the "Devonshire Association for the Advancement of Science, Literature, and Art," which has just been issued, contains reports of the papers which were read at the meeting at Teignmouth, in July of this year. Among them are accounts of "the Early Poetry of Devonshire," and of the "Devonshire Witches."

This county can boast that in the list of her poets occur such well-known names as Alexander Necham, Alexander Barclay, Sir Francis Drake, Sir Walter Raleigh, George Peele, Richard Carew, Robert Herrick, John Ford, William Brown, author of *Britannia's Pastorals*, Tom D'Urfey, Rowe, Aaron Hill, and Gay.

THE venerable Dr. Reuss, of Strassburg, has been known to have been at work for many years on a new translation of the Bible into French, with a popular commentary; but it was feared that, owing to the political difficulties of France, its publication would be indefinitely adjourned. It is the more gratifying to learn that the work is really at press, and will be brought out in parts in the course of three or four years. The subscription price, which may be paid to Messrs. Sandoz et Fischbacher, is 100 francs. The nature of the work is explained in full in the preface and general introduction which has just appeared. Dr. Reuss's *Histoire de la Théologie chrétienne* has lately received the honour of translation into English, with the sanction of a leading orthodox divine of the Congregationalist communion.

IN the last number of the *Bulletin de l'Ecole des Chartes* is published an autograph letter of La Bruyère, lately discovered among some documents relating to the navy, in the National Library. It is addressed to M. J. Phélypeaux, Comte de Pontchartrain, Minister of the Marine. The letter is the more valuable from there being only eighteen extant of La Bruyère—all, with one exception, in the possession of the Duc d'Aumale.

THE *Perseveranza* states that the Cavaliere Arnaboldi has purchased the house in which Manzoni lived, with a view to the rooms being preserved by the city in the state in which he left them at his death.

THE annual public sitting of the Academy of Inscriptions was held on Friday last. The medal for national antiquities was awarded to M. Revoil, architect of Marseilles Cathedral; the ordinary prize to M. Paul Meyer, for his treatise on the Dialects of the Langue d'Oc in the Middle Ages; the Gobert prize to M. de Boislisle, for his work on the *Chambre des Comptes de Paris*; and a second prize to M. Tiret, author of *Les Ecorcheurs sous Charles VII.* The Bordin and numismatic prizes were not awarded.

THE French Academy of Sciences has elected M. Joseph Bertrand perpetual secretary for the mathematical sciences in the place of the late M. Elie de Beaumont.

MR. AENEAS MACKAY, known to our readers as one of the contributors to the ACADEMY, has been elected to the Chair of Constitutional History and Law in the University of Edinburgh, in the place of the late Professor Cosmo Innes.

ON p. 501, col. 3, l. 22 from foot, of our last number (l. 5, par. 2, of Philological Society report), *eleventh* century was printed inadvertently for *fourth* century.

DR. DÉTHIER, director of the Art Museum at Constantinople, has recently delivered an interesting lecture on the inscription discovered by Mr. Calvert at Hissarlik after Professor Schliemann left the scene of his Trojan excavations. According to Dr. Déthier, this inscription contains five decrees, issued by the Synedrium of all the Trojan cities, from Lampascus to Gargara, the names of both of which are given. These decrees, which were to be inscribed in stone and placed in the temple of Athena-Ilias, commemorate the services to the cities of a certain Malousios of Gargara, and invest him with golden crowns for his merits in having lent to the cities money without taking interest for the loans, and for having made rich gifts for the maintenance of public games, competitions, and theatrical representations, and for the expense of sending embassies to the court of Antigonus, both before and after he became king. From this reference it is evident that these decretals refer to the period

immediately succeeding the death of Alexander the Great, or about from 310 to 301 B.C., and thus give evidence of the perfect development at that time of the Hellenic form of civic combination and corporate association in Asia Minor. The translation of the decrees is given in full in the *Levant Herald* of the 21st ult.

THE statue of Adonis discovered in America, and exhibited there as an ancient work of art, left by the earliest discoverers of America, the Phœnicians, still continues an apple of discord among American scholars. After the report of a meeting held by the American Oriental Society, in which Mr. J. Hammond Trumbull declared the Onondaga statue "to be a false antique which was completely exposed years ago, and of which the true character is known to all well-informed persons," everybody imagined that the matter was at an end. Would the American Oriental Society allow such a report to be published? would none of its members utter a warning, if the confession of the culprit admitted of any doubt? Here were the great scholars of America making merry of the scholars of Germany, and now we are told that, after all, the matter is by no means settled. Dr. White, Professor of Pathology and Microscopy in Yale College, pronounces all the stories of the recent manufacture of the statue of Adonis in plain Saxon as *lies*. That is the language which Professors of the same University use towards each other in America. Nothing would seem to be more natural than to wait till the matter has been fully investigated—a matter, too, which is of interest to lawyers rather than to scholars. There is a letter in the *New Haven Daily Palladium*, November 16, in which the writer, Mr. Alexander Mac Worter, writes as follows:—

"Are the gentlemen of the American Oriental Society prepared to set aside as worthless the testimony of Professor Moses C. White? Not so are the German professors. Thank God, there lives a nation that yet cares for truth and will pursue it though the heavens fall!"

"Meanwhile there would seem to remain yet to be performed by the American Oriental Society one closing act of justice—to make their friend (convicted by the United States court at Rochester for perjury and fraud) a member of their honourable fraternity. Who could deserve it more, according to their own showing. A man of such wonderful genius as to fashion an antique, not of your common Greek or Roman type, but conforming in every point to an older mythology and a special myth, providing it, too, with an inscription, or the semblance of an inscription, in harmony with the points of the statue, which characterises it as the Phœnician Adonis—so as to deceive, if it were possible, the very elect! We can suggest but one consideration which should deter them from such a course—the danger that the fraternity might some day be called upon to be present at an execution, which they might find it inconvenient to attend, as in the case of that lamented genius, whilom member of the American Philological Society, who was unfortunately *hung*."

When will American scholars learn to speak gently? We read in the same number of the *Palladium* of a "Lacerated Actress attempting to cowhide an Editor:" do the members of the American Oriental and Philological Societies behave much better?

Two matters connected with Charles I.'s treatment of the Roman Catholics are narrated by Angelo Correr, in his despatches from London to the Venetian Senate, whose ambassador he was, which do not appear to be recorded elsewhere. We take them from the transcripts of those despatches sent to this country by Mr. Rawdon Brown. Early in the year 1635, Correr announces the arrival at Whitehall *incognito* of a Roman Catholic priest direct from the Vatican, bearing credentials from the reigning Pope's nephew, Barberini, to Queen Henrietta Maria's confessor, the Papal Nuncio in Paris having also accredited him to her almoner M. du Plerron. The latter, however, hearing that King Charles was already aware of the priest's arrival, declined in any way to countenance his

presence; but the confessor showed greater boldness, and on January 2, introduced to her majesty at Whitehall Gregorio Panzani, the first agent openly accredited by the Court of Rome to a Queen of England, since the middle of the sixteenth century.

That the almoner was justified in doubting the King's approval of any proceeding likely to irritate the Puritans, then flocking to the "Plantations of New England," is shown by another circumstance detailed by Correr. The wife of the English Ambassador at Venice, Anne, Viscountess Feilding, died in the Giustinian Palace (now the "Europa" hotel) on March 20, 1635; her death, by a strange fatality, having preceded that in London of her father, the Earl of Portland, Lord Treasurer, by forty-eight hours. Lady Feilding was a Roman Catholic, and the Senate expressed to Lord Feilding its readiness to honour her remains with a public funeral. This mark of respect—the only one of the kind on record as paid by the Signory of Venice to an English gentlewoman—was declined by the Ambassador, until he could acquaint himself with the wishes of his Court on the subject. Secretary Coke was informed by Correr of the proposed state funeral, and on April 27 the Venetian Ambassador wrote to the Senate that the King had desired Lord Feilding to demand a special audience of the Doge for the purpose of returning thanks on behalf of His Majesty; but that as the ceremonies ordained were at variance with the usages of the Anglican Church, Lord Feilding would be ordered not to allow anything to take place with regard to the proposed obsequies.

HERR LUDWIG DAÆ, the principal librarian at the University of Christiania, has made a valuable contribution to the mediæval history of Scandinavia in a new work entitled *Fru Inger Ottesdatter og hendes Døttre* ("Madam Inger Ottesdatter and her Daughters"); this lady is chiefly known in history through her relations with Swedish politics in the time of Gustavus Vasa, but her whole life was mixed up with the most astonishing revolutions of that eventful period. She was born about 1470, and belonged to the highest rank of Norwegian aristocracy; it was her extraordinary fate to see that aristocracy—which at her birth held the sole power in the State—under Danish tyranny, losses in war, and childlessness, die out so completely, that she lived to find herself almost its sole survivor. Occasionally, as when she resisted the violent effort made by the Archbishop to bring her over to the policy of Christian II., her conduct was of national importance; at all times she is interesting to us as a stirring and prominent figure in a stormy time. Herr Daæ, at the end of his painstaking study, is of opinion that her importance in the political history of the time has been overstated. The volume is dedicated to Henrik Ibsen, one of whose earliest dramas, *Fru Inger til Østeraad*, deals with certain passages in the lady's life. She died in 1555.

NOTES OF TRAVEL.

A TELEGRAM was sent by the Admiralty to Hong-kong last Tuesday, offering the command of the new Arctic Expedition to Captain Nares, of H.M.S. *Challenger*. He has now telegraphed his acceptance, and will return to England by the first mail. It is expected that Captain Nares will be able to return to the *Challenger* after completing the expedition to the North Pole.

THE most recent news which the Imperial Russian Geographical Society have received of the indefatigable explorer M. Miklucha-Maklay, is to the effect that having now completed his researches on the ethnology of the Papuans in New Guinea, and having apparently proved incontestably the existence of the race in the Philippine Isles, he is preparing to visit the Malay peninsula. He will accordingly start from Batavia some time during the present month, land at one of the ports in the

south, and from thence penetrate into the interior range of mountains, where he expects to find a tribe called Semang, which he, in common with other authorities, considers will prove to be of Papuan descent.

A PARTY of the United States Coast Survey service, under Dr. Dall, has just returned to San Francisco, after a cruise along the Alaska coast in the schooner *Yukon*. The lines of the coast were taken from Lituyer Bay in lat. $58^{\circ} 30'$, opposite the peaks of Mount Crillon and Mount Fairweather, which mark the southern end of a high mountain-range as far as its termination at Mount St. Elias, about 160 miles to the north, in lat. $60^{\circ} 30'$. The observations made showed that existing maps were erroneous, the land not being marked sufficiently far to the west. The supposed stream called the Alsac river on the maps, and represented as reaching the sea through a delta a little to the north of Cape Fairweather, was found to be a lagoon receiving the waters melting from glaciers. The mountain range runs at a distance of from eight to ten miles from the coast, a grassy plateau, having an elevation of about 100 feet, lying between the mountains and the sea. Within the distance of 160 miles surveyed, twenty-four living glaciers, many of large dimensions, were discovered and noted down. The Grand Plateau of La Pérouse was determined to be a glacier, the largest known outside the Arctic circle. Mount St. Elias rises about twenty miles from the coast, beyond a barren plateau. The supposition that the mountain was a volcano is believed to be unfounded in fact. No traces of volcanic action could be discovered about the base. The lofty mountain range terminating here is continued to the northward at a lower elevation. The *Yukon* next sailed to Admiralty Bay, and determined the position of the numerous small islands with which the south side of the inlet is studded. The streams here, as at all points along the coast, seemed to swarm with salmon, and the brooks and creeks were filled with trout, most of which resembled the speckled trout of the Eastern States. A search was made for the Pomplona Bank, which was marked in the Spanish map of 1760 as a shoal about sixty miles off the coast in lat. 59° , but no soundings could be obtained anywhere in the locality with ordinary apparatus. The bearings of Port Etches and the position and contour of Middleton Island and the eight Semidi Islands were corrected, and the survey of Shumagin Island completed.

At the last meeting of the California Academy of Sciences, Dr. Harkness read a paper on some recent explorations of his in Plumas and Lassen counties, in the north-east of California. These counties lie respectively south-west and north-east of the Sierra Nevada mountains, which here make a bend in a north-westerly direction. The region explored is estimated to be 8,000 square miles in extent, and within this district Dr. Harkness found about a hundred extinct volcanoes. One large crater on the boundary line between the counties had evidently been recently burst during an eruption of lava. The eruption had occurred at one end of a lake which now covers an area of about three square miles. The waters had been raised and the outlet changed. The volcano rises in a conical shape to about the same height above the sea level as Vesuvius. Pumice and recently formed volcanic ash lay on the sides of the steep cone. In the lake were the stumps of trees, some of which rose to a height of forty feet above the water. The trunks of trees standing in the lava field were found to be only partially burned through. In some places the lava beds were pitted with cavities, varying from two to four feet and more in diameter. On sounding these holes the trunks of trees were found at the bottom. In other places on high ground the sides of the trees nearest the volcano were scorched or partially burned. Occasionally trees were found that had continued to grow after being

charred, and the outgrowth showed twenty-five annular marks. The lava overflow covers about one hundred square miles. An old resident of Red Bluff, who was living near this volcanic region in 1853, informed Dr. Harkness that bright sheets of flame were in that year seen day and night rising steadily from the mountains. An ancient of the Mill Creek tribe of Indians named "Shaved Head," stated that during the boyhood of his father all the mountains of this district were active volcanoes. A lake exceeding Donner Lake in extent was found a few miles from the volcanic region. This large body of water was found by barometrical measurement to be 7,330 feet above the level of the sea—the greatest altitude of any known lake in the United States. In honour of the great African explorer, Dr. Harkness named this sheet of water Lake Livingstone.

M. VENIUKOF, late secretary of the Imperial Russian Geographical Society, is engaged in the preparation of an important map of Asia, which shall embody the routes of all Russian travellers during the last thirty years. The map is intended for the approaching Geographical Congress at Paris, and with the view of its being compiled with extreme care, M. Veniukof has requested all contributors to furnish him with the most complete and exact details respecting their routes. The year 1843 has been selected as having been signalised by two important geographical events—the publication of Humboldt's *Central Asia*, and the setting out of M. Middendorf for his remarkable journey in Northern Siberia.

THE Société d'Acclimatation in Paris has received some ova of the *Salmo fontinalis*, or brook trout, from Mr. Seth Green, inspector of fisheries to New York State. It is confidently anticipated that the acclimatisation of this species will be a decided success, as it is extremely hardy, and better adapted than any other sort for artificial rearing.

THE Port Saïd correspondent of the *Levant Herald* for November 7 gives us the following details with regard to the Suez Canal:—

"The Canal Company are now busily engaged in lengthening the western mole, and clearing away the deposit which, on that side of the entrance, was fast encroaching upon the already somewhat narrow channel leading into the port. It is intended, I believe, to carry the breakwater on that side out into six fathoms of water, when its total length will be something like 3,100 metres. Sixty metres were completed last year, but the whole will not be finished for another three years at least. The breakwaters, as barriers to the sea, are everything that could be desired, but, unfortunately, below water there are numerous open spaces through which the sand and soil brought down by the Nile current finds its way, and thus banks are formed under the inner side. The company have had a powerful dredger at work since July last clearing these banks away. So great, however, is the amount of this stuff which is carried along the coast eastward from the mouths of the Nile, that the deposit on the outside of the western breakwater at Port Saïd is causing the shore line to advance seaward at the rate of about thirty metres annually. The breakwater beacons are now no longer upon the extremities of the moles, but, whilst the works are in progress, the company have stationed two large lighters between which is the entrance to the channel."

THE Imperial Library at St. Petersburg has received an interesting present from General Kaufmann, in the form of an album containing 1,200 photographic views of the scenery in the newly-acquired Russian territories of Asia Minor. It includes, moreover, numerous portraits taken on the spot, which give vivid representations of the many varied ethnological groups of the mixed population of Kirghis, Kalmuks, Mongols, Afghans, Tcherkesses, &c., who occupy these districts. This interesting series of pictures exhibits the national dress, special callings, social habits, religious ceremonies, popular amusements, architectural and other features which characterise the people and the country.

THE ascent of Mount Popocatepetl has been attempted, and successfully accomplished, by a party of American tourists, among whom were three ladies. This difficult enterprise took three days in accomplishing. For three nights they were encamped upon the mountain. The summit, which was reached on the second day, is nearly 18,000 feet above the level of the sea.

JOHN DOUGLAS, BISHOP OF SALISBURY, AND HIS CORRESPONDENTS.

ANOTHER contribution, hitherto unknown, to the abundant store of memoirs, diaries, and letters illustrating the eventful latter half of the eighteenth century, has lately found its proper home in the Manuscript department of the British Museum. It consists of a short autobiography of John Douglas, Bishop of Salisbury, and several volumes of letters addressed to him by more or less distinguished contemporaries. The political history of that period has been too well worked for us to expect anything fresh or novel regarding it to be gathered from such a collection; but the bishop's own relation to his times, especially in his literary and social character (the clerical element in it being almost indiscoverable), seems well worthy of exposition; and, thanks to his care in preserving such documentary evidence, we hope to attach some slight degree of interest to this summary of his life and correspondence.

The volume purporting to contain the bishop's autobiography gives us little more information regarding him than was furnished by his son on his death in 1807, which may be read in the *Annual Register* for that year. We need, therefore, dwell but a short time upon this portion of the manuscripts. John Douglas was the son of a merchant at Pittenweem, in Fifeshire, and was born at that place in July, 1721. Of his education he himself writes:—

" . . . I was at Dunbar school some years where I learnt Latin & Greek under a Mr Gilloch, who was certainly a good schoolmaster, & I was pretty forward in my learning, for I was sent for, with my brother, to London in summer 1735; and after that I scarcely learnt anything more of the learned languages at school, tho' I was at Clare's Academy in Soho Square & Stotherd's in Charles Street till I went to Oxford. At Clare's I learnt French most correctly, and at Stotherd's I found I knew more Latin & Greek than the rest of the scholars, & learnt little in advance."

In 1741, after leaving Oxford, he returned to Scotland, and was at Edinburgh "at a busy time when the Parliament was choosing, which next winter turned against Sir R. Walpole." He went abroad the following year and settled for a while at Montreuil in Picardy, "where live many of the noblesse, who are very poor and very polite." On his return to England he resumed his studies at Oxford. The Greek historians, he writes, the early Fathers, and English divinity were now his favourite and constant studies; modern history was always his amusement. In 1744 Douglas was ordained deacon, and was appointed chaplain to the third regiment of Foot Guards in Flanders. He joined his regiment in July. After an inactive campaign, during which they were encamped on the plains of Lisle with a superior army, they went into winter quarters about the middle of October, and Douglas passed the winter at Ghent, where the Foot Guards quartered:—

"Here I learnt Italian & also to play on the violin. The winter went off very agreeably as we had very good society amongst ourselves, and the enemy did not disturb us. We marched from Ghent on the 14th April 1745, the army having all assembled under Brussels, we marched to raise the siege of Tournay, and were defeated on Tuesday April 30th at Fontenoy. I was not an inactive spectator of that battle, for I was employed in carrying orders from General Campbell after his leg was cut off, to the English who guarded the village, where he and the rest of our generals were quartered. . . . Our Regiment with nine others received orders to march for England, on account of the Rebellion. We em-

barked at Willemstadt, & arrived at Gravesend, on Sunday (I think) the 20th of September. On arriving in London on Monday 21st, we heard of the battle of Preston Pans."

Douglas's connexion with the army now ceased, and in November he went down to Oxford, where the master and fellows of Balliol elected him to a Snell Exhibition, worth 40*l.* per annum. The following year was passed principally in college. In 1747 we read that he was curate to a Mr. Walker at Tilehurst, near Reading, for nine months, and had afterwards a permanent curacy at Dunstew, in Oxfordshire. In the summer of 1748 he was engaged by Lord Bath at a salary of 200*l.* per annum, "to attend his son on his travels abroad as his governor." In his employer we recognise the once famous opponent of Walpole, and (according to Macaulay) the greatest leader of opposition the House of Commons had ever seen.

The residence of Lord Pulteney and his tutor abroad is chiefly of interest to us by reason of a correspondence kept up by Douglas with a friend in London, which has been preserved. Two or three of the London letters are very valuable for their allusions to passing events chiefly in the literary and theatrical world. The writer is John Blair, probably the person of that name who had left Edinburgh for London about this time, and afterwards gained considerable reputation as a writer on chronology and divinity.

The letter from which we give the first extract is endorsed as having been received in September 1748.

"I won't pretend to write you much news as this season of the year can help me to very little. Poor Thomson *y^e* Poet died of a Fever about three weeks ago, so that you may believe the Muses are in mourning. Mr Hunter *y^e* anatomist is just come from Paris where he passed a month & tells me that he left a new Play of Voltaire's in the run of Acting, he calls it *Semiramis*. Voltaire in imitation of Shakspear has introduced a Ghost in it, but Hunter tells me it is not at all lik'd, perhaps *y^e* more so as it is shokingly acted. I have sent you enclosed a copy of a Turnbridge Satyr, which is *y^e* best of *y^e* kind *y^e* I have seen for some time. The Duke before he went for Flanders tother day committed sev^l comical Frolics in *y^e* dark walks of Mary Bone Gardens even to some Ladies of virtue. The reason of his coming over was to have *y^e* Power of Disbanding what Regiments he pleas'd, but *y^e* was a Privilege which *y^e* Lords of *y^e* Regency absolutely refus'd giving up. We have been amus'd within *y^e* two days w^t *y^e* Rumour of a Renewal of *y^e* War, as all the officers *y^e* are here are order'd over instantly. My lord Crawford is not even excus'd, tho' he has been much indispos'd of late. Coll. Fitzroy who has lately married the quondam Dutchesse of Beaufort has thrown up his Commission, upon the Duke's refusing him leave to continue longer in England. There goes a foolish Jacobite story here of a vision of a Battle wⁱⁿ two miles of Aberdeen betw^t 2 armies in Tartan and in Red upon *y^e* 5th of Aug^t in which you may believe *y^e* latter appear'd to be cutt in pieces; they pretend it was seen by upwards of 30 country people who are ready to give oath upon it & *y^e* it was attended w^t an appearance of two suns and so forth. Smollet has finish'd a new Comedy, in which he says he has introduced a new original Character of an absent man, which he expects to get on the stage this winter. Thomson has left nothing behind him but his *Coriolanus*, which by accident is in *y^e* custody of Mr Mallet; he left no will." . . .

In a postscript, Blair gives his address at the British Coffee House, or at the Academy, Poland Street, Soho.

In a second letter, dated "London, Jan^y 19th, O. S. 1748," Blair writes:—

"An Adress from the University of Oxford was designed to have been presented tother day by Dr Lee, of Balliol & some others, but the King sent them word that he was not at leisure. The adress has been published, however, in all the Papers & many People have pretended to find in it many ambiguous Reflexions, and cool Ironical Compliments, & faint Epithets applied to the late affair, which they say has occasion'd its being refus'd. We have a pamphlet of Lord Percival, now Earl of Egmont, ag^t *y^e* two P^l-hams *y^e* makes a noise here & is extremely well wrote;

it was at first given by some to my lord Bath. Our Friend Tom Melvill is just now preparing a furious Pamphlet ag^t the African Company under the direction of *y^e* Earl of Halifax & L^d Dupplin who are Lords of Trade & Plantation it is intended to be publish'd before *y^e* affair of *y^e* African Company comes on before the House of Commons when it is said *y^e* company will be dissolved & Tom expects to go out Chief Governor. Middleton's Book ag^t *y^e* Fathers & *y^e* Miracles of *y^e* 3 first centurys has been publish'd now this month; it seems to be wrote not only w^t s^p but back'd w^t good shrewd stubborn authoritys, *y^e* I only mention from *y^e* Passages which regard Justin Martyr & Irenaeus *y^e* being the only ones I have look'd into, I fancy however it promises to kindle up a pretty hot Controversy even all over Europe as it is a Branch of Divinity of very universal Consequences. Thomson's Play of *Coriolanus* has had a Run now of six nights; it begins, however, to flag a little, as Quin is *y^e* only Actor in it, & his Part is indeed *y^e* only character. It is in his old way of composition, little character, many cool moral sentences & tedious speeches w^t little or no Business. Mr Littleton shows his friendship in promoting *y^e* Play & crowding w^t all his Friends *y^e* third nights which are for the Benefit of the Author's Sisters. Garrick has been acting a Piece of his own of three Acts called *Lethe*, being a grave kind of a satire much like the *Toy Shop*, one of his Brothers comes on the stage some of these days by way of a new Actor. His first appearance I think they say is to be in Johnson's new Play of *Mahomet & Irene*. Johnson in order to make *y^e* world a little acquainted with his name beforehand has publish'd a Satire in imitation of the tenth of Juvenals in which there is both good Poetry & Judgement. We have been highly diverted within these few days w^t an affair which ended in *y^e* destruction of the little Play House in the Haymarket, which was this—we were amused about a week ago by an advertisement of a Person *y^t* was to perform there certain wonderful Feats such as playing upon a cane *y^e* same tunes & in the same manner as others do upon all kinds of instruments, bringing out a quart bottle and then without any sort of equivocation thrusting himself into it & from thence singing all sorts of tunes—nay, he was to raise any Dead Person they chose to see & to allow *y^m* to converse w^t him some minutes if they pleas'd. The prices were 7*sh.* 6*d.* for the Boxes & a Crown for the Pit & so in proportion. The advertisements were repeated, the Bait took & in short the House was crowded by Noblemen, Gentlemen & evⁿ Ladies; the Duke was there too among the Rest, when six o'clock came there was neither Music nor Performer, a Fellow at length step'd out & told *y^m* *y^t* if the Performer did not appear in a Quarter of an hour *y^e* money w^d be return'd, upon which your Friend Guthrie who was present says, one got up & by way of Joke told *y^m* *y^t* if they w^d double *y^e* money *y^e* Performer w^d get into a Pint Bottle; which immediately began *y^e* Riot upon which one Remarkable Fellow sprung upon *y^e* stage from *y^e* Pitt, catch'd hold of the scenery & lining of *y^e* House and like a destroying Angel tore it up by sheets, many pluck'd up the Benches and began to play *y^m* ag^t *y^e* Pillars *y^t* supported the Gallery like so many battering Rams. Then some of *y^e* sober part of *y^m* began to think of *y^e* money, got to the Box, broke it open, where they found only about fifteen or twenty pounds. A Body of Pick Pockets by this time had made their way into *y^e* House & made a most excellent Booty; The Duke of Cumberland lost a fine gold hilted sword. After *y^e* Gentlemen were got out the Mob soon dismantled the House brought out everything that was moveable into *y^e* middle of *y^e* Haymarket & there set it on fire, having erected a Pole upon which they hung *y^e* Curtain by way of standard. So ended *y^e* notable affair which after all comes out to be a joke of the Duke of Montagu, who wanted to know how far *y^e* credulity of *y^e* Town might be imposed upon, & so went there himself to see the Sport; this piece of Merriment will however cost him about two or three hundred Pounds at least. I am pleas'd to see by what you write me *y^t* the English language makes such progress in Germany; it is quite the case I'm informed in France, where Voltaire & some others promote *y^e* Learning of it mightily & made *y^m* throw away *y^e* Italian and Spanish Books to make way for it. . . .

"Robbing in *y^e* streets is got to a great height here insomuch that they knock down People before it is dark & rob in Gangs; sev^l Parishes are having sol-

diers to patrol y^e streets in small Bolds, finding the Watchmen of no service."

The next letter is dated March 30, 1749, and begins:—

"I received your agreeable favours of Feb^r 21st with your diverting account of the German stage in which I think you honour it too much in conceiving it to be y^e same wth ours about a century and a half ago, for I am afraid we have got nothing now-a-days among ourselves to compare wth y^e Productions of y^e time. Both Thomson's & Johnson's Plays are poor enough, y^e last has got a warm Fancy but little or nothing of y^e Pathetic, for his Piece is more over-run with metaphor than even Row himself would have done if possible, so y^e Talent does not seem to fit him for the Stage. He published by way of ushering in his Play a very good Imitation of Juvenal's tenth Satire which gave a very favourable expectation of his Play, but y^e was a dreadful falling off. But if we seem to sink in our Genius for Play writing, y^e scale certainly rises in other things. The three last volumes of *Clarissa* are inimitably well, & Fielding's new Piece of Tom Jones reads not badly—it is rather inferior to Joseph Andrews & has no character half so diverting as Abraham Adams; however it is in higher Life, & contains many good scenes & quaint witticisms which do well enough now & then. There is a droll contrast betw^x y^e last Piece of his and Joseph Andrews. For as he had been condemn'd by many Criticks even of y^e Fair Sex for y^e immaculate Chastity of Joseph, he has now given his hero Tom Jones a violent & constant Passion for a young Lady, & without lessening y^e makes him at y^e same time lye wth every woman y^e comes in his way. It has so great a Run y^t I believe five or six thousand copys of it are already sold. I wrote you ab^t Middleton's Book before, which I have read since, & think it not a bit inferior to any thing he has ever done before; it seems he once intended it sh^d have been a posthumous work, but *Tacitus* Gordon [a political writer, and favourite of Sir Robert Walpole] prevail'd upon him to publish it now y^t he might do Justice to his own work ag^t y^e many Antagonists it must raise him. I understand two young Fellows at Oxford intend to flesh themselves upon him by way of their first essay in Controversy, which they design to undertake in company. Their names are Merrick & Forster; Merrick I think published some time ago a Translation of Triphiodorus, & Forster some Dialogues of Plato. . . .

"The opposition betw^x y^e Court & y^e Prince's Party runs so high y^t tho' Mr Littleton was designed to succeed Mr Dodington as Treasurer of y^e Navy, he dare not accept of it, as his cousin Tho^s Pitt is of the Prince's Party & Member along with him at Okhampton having y^e Principal Interest y^e declares, y^t if he does accept he shall not be rechosen. There is a Bill soon to be brought in for purchasing proper spots of ground in y^e Highlands of Scotland on which to build proper Towns wth great Privileges & Immunities to encourage manufactures & to civilize them a little. . . .

"There was a great Likelihood of a famous Lawsuit betw^x y^e AB^s of Canterbury & y^e Bishop of London ab^t y^e Right of presenting to the Rectory of St George's Hanover Square when Dr Trebeck shall die, as the AB^s has the Right of chusing a Living in y^e gift of y^e B^p of London on every new Translation, however, it has been amicably made up by y^e AB^s making choice of another, as y^e B^p intends y^t for one Mr Aubery, a nephew of his own, the son of a coach harness maker at Charing Cross who married his sister.

"Lady Betty Hastings was appointed t^other day one of y^e Ladys of the Bedchamber to y^e Princesses in y^e Room of Lady Ann Montague who is lately married, but upon Lady Betty's coming to Court, she found one of y^e Dutys of her office was to play at cards on Sundays wth y^e Princess Amelia upon which by reason of a scruple of conscience she resigned."

Turning aside from this entertaining correspondence, we come across one or two letters from Lord Bath, relating to his son's education and expenses. Mr. Forster in his essay on Churchill speaks of the "money-loving old Lord Bath," whose desire to read one of the satirist's latest hits is tempered by the thought of the heavy charge for postage which will be incurred in having it sent to him abroad; and these letters will not give a different aspect to his lordship's character. In one of them, written from Bath, November 23, 1748, he acknowledges the particulars sent to him

of his son's last quarterly disbursements, and complaints of the "vast price" paid for some matters, such as thirteen dollars a month for a French master, "which is more than two guineas the highest price ever paid in London." In the latter part of the letter, however, Lord Bath comes to the conclusion that this particular charge may not be so very exorbitant after all, if the master attend every day. Thus, there is a limit to his parsimony; eighteen pence a lesson is not too much to be paid for the instruction of his noble son in the most polite language of the day. Douglas is considerably informed that these observations are made, not "by way of finding fault, but only to have explanations." One other extract we give without comment.

"As for my Lord's new wigs & new cloaths & new Shirts &c. I own they surprise me. My lord carried, besides old ones, a new wig with him, he made one in Holland, I have sent him another from hence, & he has made one at Leipsick, so that he has had four in four months' time, & as for new cloaths, shirts &c. I know my Lord's foible is to have new every week, if you think fit to indulge him in it—but this first you know, you must live within compass, that you may afterwards travell at a little more expense, & let my Lord know that he will find it very troublesome to carry a great deal of baggage, consisting of old cloaths, &c. wherefore I would advise him to wear out his old ones before he makes new, for great changes of raiment is extremely inconvenient in travells."

Lord Bath shows his acknowledgment of Douglas's services to his son in the most substantial manner by presenting him in 1749, on his return to England, to the rectory of Eaton Constatine and the Donative of Uppington, livings which had become vacant during his absence abroad.

J. J. CARTWRIGHT.

(To be continued.)

PARIS LETTER.

Paris: Nov. 30, 1874.

One of the books which I announced as on the point of publication in my last letter has since then appeared—the first volume of the *History of the Hungarians*, by M. Sayous (Ernest Leroux). He has as yet given us only an introduction treating of the "Origin of the Pagan Epoch," in which, thanks to his knowledge of the Hungarian language and of the works of Magyar scholars, he sets before us with clearness and precision the latest researches on the early institutions and religion of the Hungarians, as well as on their incursions into the West, up to the battle of Augsburg, which forced them to remain stationary on the bank of the Danube (955). Another member of the University, M. Petit de Julleville, has just published a *History of Greece under the Roman Domination* (Thorin), a work of solid value in an elegant literary form; and M. Feugère, Professor at the Collège Stanislas, has shown talent enough, in an Essay on Bourdaloue, to justify M. de Loménie's choice of him as his substitute in the Chair of French Literature at the Collège de France. M. Feugère has brought to this study of an apparently dry and threadbare subject a zeal which amounts to a passion. He has added many new details to our knowledge of the struggle between the famous Jesuit preacher and the Jansenists. It is only to be regretted that he has so completely shared the sentiments of the author he was studying, as to treat Pascal and the *Lettres provinciales* with unjust severity. Bourdaloue, the Jesuits, and M. Feugère himself may do what they will, but the judgment pronounced by the *Provinciales* is without appeal, even though some of the premisses may be erroneous.

The publication of several other books of history is announced. M. Perrens has read, before the Academy of Moral Sciences, several chapters of a *History of Florence*, the first volume of which is completed; and which, if we may judge from

the size of the first instalment, will be a considerable work. M. Thiers was formerly engaged on a history of Florence. He had collected numerous materials, and had had copies of many documents taken; but he has now given up history for the natural sciences regarded from the philosophic point of view. This is not very greatly to be regretted. M. Thiers would have related with marvellous charm and animation the rule of the Medicis; but to penetrate the secret of the formation of the Florentine institutions in the Middle Ages would have required a patient scholar. M. Perrens appears to have approached his task with conscientious care, and from the chapters which he has made public we may expect him to give us a solid and useful book. The only detailed history of Florence which we possess, that of Ad. Trollope, is altogether inadequate.

Some statesmen whom the Assembly will but too soon plunge once more into struggles as obstinate as they are barren, seek rest and consolation amid the fatigues and vexations of parliamentary life in works of history and philosophy. M. de Pressensé is busy finishing his *History of the Three First Ages of the Christian Church*. He is writing the sixth volume, devoted to ecclesiastical organisation. M. Edgar Quinet has just published, under the title of *The New World* (Dentu), a somewhat confused medley of thoughts of all kinds—historical, scientific, religious, moral. Unfortunately, the book shows but too unmistakeably the effects of advancing years. M. Quinet desires to give his own creed and that of the age; but his voice is scarcely listened to, and, absorbed in his pontifical gravity, he does not perceive that he is preaching in an empty fane. Like an almost extinct volcano, he still sends out occasional flashes from the midst of volumes of smoke.

A work destined to make more noise in the world than M. Quinet's, is the *Unpublished Correspondence of Proudhon*. The first volume has just appeared, and is to be followed by seven others, not to mention divers posthumous works (*Struggle of Caesarism and Christianity, History of Poland, &c.*). This first volume of correspondence, comprising the letters from 1832 to 1841, is of the highest interest. Ste. Beuve in his study on Proudhon quoted numerous extracts. The whole volume has an equal claim to be read and admired. It shows everywhere the same wealth of ideas, the same spirited style, that logic à outrance which starts from common sense to arrive at paradox, that warmth of heart and that frankness, uprightness, and courage which win our affection for the man, whatever opinion we may have of his systems. In this volume we see Proudhon first as a compositor, then as an inmate of the Academy of Besançon, as fervent in his beliefs as he afterwards became in his negations, and engaged on a great work of philology and philosophy, in which he aims at proving religious truths by the analysis of language. Despite the strangeness of this enterprise, his words had a touch of genius when he said—it is the leading idea of Professor Max Müller in his mythological researches—"Since words are the signs of ideas, the history of language must be the history of all philosophy." The volume ends immediately after the publication of his memoir entitled *What is Property? It is Robbery*. He had then entered upon the full possession of his talent, but he had also taken up that militant and aggressive attitude which suited his critical talent and combative temperament.

However, it is not the appearance of this new volume of Proudhon which has been the great literary event of the month, but the publication of the complete works of André Chénier by his nephew M. Gabriel de Chénier (Lemerre). It was known that the edition given in 1834 by Latouche, and revised with greater care by M. Becq de Fouquières, was incomplete and inaccurate; but no one suspected the importance of the revelations to be made by M. G. de Chénier. The order of the poems is turned upside down; a multitude of notes in prose, which accompanied the verses, are

published for the first time; to crown all, we find several hundreds of new verses, unknown, admirable, like all that this marvellous poet has written, "this belated Greek of the end of the eighteenth century," who combined depth of thought with an inexhaustible imagination, the only French poet whose verses give the feeling of perfection. We are sure now that we have him complete in these three charming volumes, and that we have lost nothing of these treasures.

After Chénier it is hard to come to contemporary poets. But there is one who is worthy to be named after him, in whom there lives again something of his soul and of his style, who knows like him:—

"Sur des penses nouveaux faire des vers antiques."

I allude to Sully Prud'homme, who is about to publish a new volume, in which are some of the most beautiful verses he has written. It will probably be entitled *Les Tendresses*.

One cannot speak in like terms of praise of M. F. Coppée's new volume, *Le Cahier Rouge* (Lemerre), which is simply a collapse on the part of its author. In seeking to find poetry in simple things, he has fallen into triviality and platitude. Luckily he perceives his error himself, and he is now engaged on works of a higher inspiration and greater length, which will restore his somewhat tottering reputation.

Two other young poets have just made their first essay in the dramatic line, with both talent and success: M. Marc Bayeux in *Nos Aïeux* (Laplace), a very incorrect, but withal vigorous composition, in which under the names of the ancient Gauls he has sung our late disasters; and M. Gustave Vinot in his *Nouveaux du Pape*, where we meet again, but in a riper state, the same high poetic qualities, the same breath of passion, which were so greatly admired in his *Prometheus*.

Fiction is at the present moment more poorly represented than poetry. The only work worthy of mention which has appeared very lately is a volume by Alphonse Daudet, *Fromont jeune et Risler aîné*, an exquisite painting of the manners of the shopkeepers of the Quartier du Marais in Paris, in which the most delicate sensibility is intermingled with a startling realism.

Literary criticism is no richer than romance. The reprint of old articles by Théophile Gautier, Mérimée, and Sainte-Beuve has brought to light nothing very remarkable. The only interesting work which has appeared recently is a study on Leopardi by M. Bouché Leclerc (Didier). An earnest and searching appreciation of the great Italian poet's work is combined with a very complete biography. Excellent translations of Leopardi's finest poems accompany and justify the author's criticisms.

The complaint is sometimes made that the French book-trade is hampered by the mass of light literature. It seems rather at the present moment as if the supply were insufficient. What fill all the booksellers' windows are the scientific and philosophical books of Germer-Baillière, Hachette's school books—among these Brachet's *French Grammar* has just appeared, in which for the first time the principles of philology and the history of the language are introduced into the teaching of French—and lastly, the editions of our great classical writers published by Lemerre, Jouast, or Firmin Didot. As yet only one Christmas book has appeared, and that is a book for scholars, the *History of Costume*, by M. J. Quicherat (Hachette). It is a work of the highest value, such as was to be expected from the Professor who gives such brilliant lectures on archaeology at the École des Chartes. It will be, we hope, only the first of a series of works on the various branches of French archaeology which M. Quicherat alone is in a position to give us, and for which he has long been collecting materials.

GABRIEL MONOD.

NEW YORK LETTER.

New York: Nov. 9, 1874.

A volume entitled *Democracy and Monarchy in France*, by Professor C. K. Adams, has just been issued from the press of Henry Holt and Co., of this city. Professor Adams, in ten chapters of remarkably lucid writing, carries his readers through the weary years of trouble which have been the inheritance of France from the great Revolution to the present day. Long years of rest she certainly has had, but these have been as disastrous morally as the bitter years of warfare have been physically ruinous. The author arrives at the conclusion that the French possess a revolutionary spirit that is permanently content with nothing, and that if they cannot march slowly to reform they must have a strong controlling power to curb that spirit. He evidently has no faith in the present state of the country. Such conclusions are all the more remarkable as coming from a citizen of the American Republic, and a Professor at a Western university. It does seem anomalous that an American should admire the German Empire more than the French or Spanish Republic, but to the deeper enquirer it is clearly the legitimate outcome of the facts. In the German Government, with all its despotic possibilities, the student sees a guarantee for advance in self-government; in irritable, revolutionary France, however, he can find little hope of political education for the people. Professor Adams writes strongly, but apparently without animus. The motives and reasons for the many weaknesses of Napoleon—whom the English were so fond of calling the Sphinx—are stated with great clearness and without undue emphasis.

Edward King's papers on "The Great South," which appeared in *Scribner's Monthly* will be issued in book form, simultaneously with their appearance in England and Scotland, by the American Publishing Company of Hartford, and sold by subscription only. The book is profusely illustrated with designs by Thomas Moran, the landscape painter, which are beautiful specimens of the wood engraver's art.

The name of Dr. J. G. Holland's forthcoming serial has been changed from *The Wheel of Fortune to The Story of Seven Oaks*. D. Appleton and Co. announce for early publication a *History of the Conflict between Religion and Science*, by Dr. John W. Draper, and a volume of *Picturesque Europe*, uniform with *Picturesque America*.

Mr. William Cullen Bryant, the veteran poet, and editor of the *Evening Post* newspaper of this city, celebrated his eightieth birthday on the third of this month. During the early part of the day he was engaged at his desk in the *Post* office, and did not retire to his house until the afternoon. There he was received by a number of friends bearing a congratulatory address signed by several hundreds of his friends and admirers. The address stated that the signers proposed having a memorial vase made in his honour, which would be placed, when completed, in the Metropolitan Museum of Art. Mr. Bryant expressed his thanks in a few appropriate words. Would it not have been more to the point if the vase had accompanied the address, and been presented to the poet himself, rather than the promise of it for a city institution? Notwithstanding his eighty years, Mr. Bryant is as active and energetic as some men of forty. He is at his office every day, and some of the most vigorous editorials that appear in the *Post* are from his pen. Beside this, he is engaged, with the assistance of Mr. Sidney Howard Gay, in preparing a history of the United States for Scribner, Armstrong and Co. The work is to begin with the earliest history of the Western Continent, and end with the first century of American independence.

Harper and Bros. will publish early in December, simultaneously with its publication by Mr. Murray in England, a volume on the Communistic Societies of America by Charles Nordhoff. Mr. Nordhoff spent three years among the singular

people who form the subject of his book. He introduces communities whose existence is scarcely known, and tells of the inner life of many, the leading features of whose customs have been made familiar through books of travel. Mr. Nordhoff is a graphic writer, and is particularly clever in dealing with subjects like the foregoing.

The Italian Opera season did not open in earnest until Mdle. Albani arrived in this city. Her American *début* may be pronounced an unequivocal success. The audiences at the Academy of Music have increased in numbers on every night of her appearance. The higher notes of Mdle. Albani's voice are its greatest charm. In concerted music she cannot hold her own, and she fails as an actress. Her stage manner is, however, agreeable and quite ladylike.

Theodore Thomas's orchestra began its series of symphony concerts and rehearsals last week. The most important number on the programme of the first concert was Berlioz's *Harold in Italy*, which has been played but twice before in New York. Although this work has been written for forty years, it is only now receiving proper appreciation. While there are parts of this symphony which are only comprehensible to the few, there are others again whose beauties are readily perceived by the many. It is impossible to imagine anything finer than the performance of this symphony by Thomas's orchestra. At the second concert of this series a Suite of Bach's in B minor will be played for the first time, as will also Schumann's First Symphony, in B major, and Liszt's Symphonic Poem, *Die Ideale*, together with Beethoven's trio, *Tremate, empi, tremate*, for voices and orchestra. It speaks well for the growth of musical taste in this country that these concerts are liberally patronised.

CORRESPONDENCE.

THE BHARHUT SCULPTURES.

38 Clarendon Gardens, W.: Dec. 1, 1874.

Through the kindness of Dr. Max Müller, I have now seen a photograph of the Jetavana bas-relief, and a rubbing of the inscription. I admit at once that the emendation I proposed last week of *pi* for *pe* in the name Anāthapindikā cannot be sustained. The letter is as clear as possible, and is *pe* and nothing else.* My other emendations, however, are fully justified, the *d* of *-pedikā* is, as it should be, the lingual *d*, and the word read by General Cunningham *dati* is almost certainly *deti*. The letters are about an inch in height, and the inscription, which is wonderfully preserved, reads:

Jetavana Anāthapindikā deti kofisanthātana ketā.

There are no traces of an anusvāra at the end of *Jetavana*, but it has probably become effaced. I now pass to the bas-relief itself. My anticipation that the purchase of the garden and the gift of the monastery were both represented proves to be perfectly correct, the picture forming a medallion into which the two scenes are crowded (somewhat to the detriment of perspective) in a way not uncommon in Hindu art. On the right two men are literally paving the garden with little square blocks, up to the roots of the sandal trees which Hardy expressly states were left standing when the common trees had been cleared away (see *Manual of Buddhism*, p. 218). At the bottom of the picture is a bullock cart piled high with the same blocks, which a man is unloading, apparently tilting up the cart for the purpose. The two bullocks are unyoked, and are lying down by the side of the cart. On the left is the monastery, with a crowd of monks standing near it, while conspicuous in the centre of the medallion stands Anāthapindikā, holding the water of donation (*dakṣhinodaka*) in a vessel of the exact shape of the "cruche," which all who have visited the south of France are familiar with. In front of him is a figure which I believe to be intended for Gautama Buddha, his right hand extended to receive the water of donation. Lastly, in the background, we have a representation of Buddha's house at Jetavana, with its name, Gandhakutī, "chamber of perfumes," inscribed above it.

I had long been anxious to find the Pali version of the story of Anāthapindikā in order to ascertain whether its language bears out that of the Bharhut inscription. It occurred to me this morning that the story might be found in Buddhaghosa's Introduction (*Nidāna*) to the Buddhist Jātaka. I at once examined that work,† and found, to my great delight, not only the story of Anāthapindikā, but the very expression "a layer of *koṭis*," which is a crucial one in the inscription. The passage is as follows:—

Tasmim samaye ANATHAPINDIKO gahapati. . . . JETAVANAM KOṬISANTHARENA atthārasāhiraṇṇakofihī KINTVA navakammam patthapesi. So majjhe Dasabalassa GANDHAKUTIM kuresi.

* I take this opportunity of correcting an inadvertence in my last letter: the form *vandate* is correct Sanskrit, though in Pali we only have *vandati*. The dialect of these inscriptions is certainly not pure Pali, though at first sight it appears to be so.
 † Sent to me some time ago by Mr. Fausbøll.

Which means, "At that time the householder Anāthapindikā, having purchased the garden of Jeta for a layer of *koṭis*, for eighteen *koṭis* of gold, began to build (*lit.* set on foot the new works). In the midst he built Buddha's pavilion." I have placed in capitals the words which this passage has in common with the inscription, and it will be seen that every word of the inscription is found in the passage except *deti*, which, however, occurs further on. The words *santhātana* and *santhārena* are exact synonyms, and *kinivā*, "having purchased," corresponds to *ketā*, "purchaser." The text distinctly states that Buddha's house was on the Jetavana grounds, and sure enough there it is in the bas-relief.

After a brief enumeration of the monastic buildings erected by Anāthapindikā at Jetavana, the narrative proceeds to describe the triumphal progress of Gautama from Rājagaha to Sāvattihī, and the pomp with which the wealthy *setthi* went forth to meet him. Then we read:—

Bhagavā imam upāsakapariṇāma purato katvā mahābhikkhusanghaparivuto . . . Jetavanavihāram pavasi. Atha nam Anāthapindikā puechi, kathāham bhante imasmim vihāre patipajjāmiti? Tena hi gahapati imam vihāram āgātānāgataṃ bhikkhusanghassa dehi. Sādhū bhante ti mahāsetthi suvanna-bhikkhūkaṃ ādāya Dasabalassa hatthe udakam patetvā, imam Jetavanavihāram āgātānāgataṃ cātuddisassa, Buddhapamukhassa sanghassa dammiti adāsi.

"The Blessed One, preceded by this procession of devout laymen, and followed by a great company of monks, entered the monastery of Jetavana. Then Anāthapindikā asked him, Lord, how am I to proceed in the matter of this monastery? Since you ask me, householder, bestow this monastery upon the Buddhist clergy, present and to come. And the great *setthi*, replying, It is well, lord, took a golden ewer, and pouring water upon the Buddha's hand, made the donation with these words, This monastery of Jetavana I give to the clergy present and to come, in all parts of the world, with the Buddha at their head."

Here we have the only remaining word unaccounted for in the inscription, for *adasi* in the text answers to *deti*. And we have no difficulty in identifying the "golden ewer" with the vessel which Anāthapindikā in the picture is holding in his hands.

I think I have now written enough to show not only that the element of uncertainty may be eliminated from this question, but that we owe to General Cunningham one of the most imposing archaeological discoveries of the present century.

R. C. CHILDERS.

10, Princess Square, Plymouth: Nov. 30, 1874.

There is one inscription on the Bharhut sculptures which has not been noticed either by Professor Max Müller or Professor Childers, which deserves attention.

I allude to one which I read on a photograph before me: "— Janaka Rāja Sitalidevi." This inscription is placed over a curious group, which may be detected at once as the "Janaka Jātaka." This Jātaka has been translated by Bigandet from the Burmese. We have in the group: (1) Janaka, (2) Sitali (*Thivalee* in the Burmese), and (3) the arrow-maker. The scene agrees admirably with Bigandet's account (p. 420, *Legend of the Burmese Buddha*, 2nd ed.), and the singular gesture of Janaka as he holds up two fingers of one hand, and one finger of the other, as though in doubt whether to leave his wife or retain her, is very interesting as showing the way in which these early sculptures were made to convey their meaning. The next group on the same frieze appears to be a continuation of the subject, but the inscription is unfortunately worn away. Above the group in which Anāthapindikā is represented spreading his money on the site of the Jetavana, I read an inscription, "Chitīyā dasi la." Whether this could be rendered "the gift of the site," Mr. Childers will be able to determine better than I can.

The group in which Elapatra Nāga is worshipping Buddha, which is also before me, but without any inscription, agrees with the translation of this

event which I have made from the Abhinishkramana Sūtra, and which will, I hope, shortly be published. I should not presume to question Mr. Childers' textual correction, but I hope he will pardon me for differing from him as to the worship which he supposes is being paid to the Tree. Not only does the narrative of this event distinctly refer the worship to Buddha (Bhagavat), but I think if he examines the Sanchi sculptures he will find that they include many instances of undoubted worship paid to Buddha while the worshippers are prostrate before the (so-called) altar and tree. I am sorry to differ from such an authority as Mr. Fergusson on this point, but the more I study these groups the more I am convinced that the altar, so called, represents the seat or throne (it is developed into a throne at Amravati) on which Buddha was seated under the Bo tree when he arrived at complete enlightenment, and that the people engaged in worship are in fact worshipping Buddha, although not represented by any figure; for we know no figure was made of him for some centuries after the rise of his religion. This also bears out the theory of the antiquity of the Bharhut and Sanchi sculptures, compared with those at Amravati. It also proves (and this is much more valuable in my opinion) that the original worship of the Buddhists was a spiritual worship.

SAMUEL BEAL.

MARLOWE AND SHAKESPEARE.

Nov. 30, 1874.

Years ago, when I was a school-boy, I made a small Shakespearian discovery connected with Marlowe's "Hero and Leander," which delighted me much at the time. One is so apt to find out that the "discoveries" of one's school-days have been generally known since the year 1, that I have always set this also aside as probably too hackneyed to be worth mentioning. It was not till Mr. Minto's admirable *Characteristics of English Poets from Chaucer to Shirley* came into my hands, that, surprised at his not mentioning it in his analysis of Marlowe's adorable poem, I began to suspect it might be unnoticed. And as far as I can learn by enquiry, such is the case.

In Hero's first speech to Leander, where she is letting him know how he can find her tower, she describes it as standing

"where all is *whist* and still,
 Save that the sea, playing on *yellow sand*,
 Sends forth a rattling murmur to the land."

Compare this with Ariel's song in the first act of the *Tempest*:—

"Come unto these *yellow sands*
 And then take hands;
 Curtsied when you have and kiss'd—
 The wild waves *whist*."

It appears to me beyond all question (and I may be allowed to add that Mr. Swinburne, who of all men living ought to understand best the relations between Marlowe and Shakespeare, entirely concurs with me), that an echo of the dead shepherd's words, written when Shakespeare himself, though so nearly of the same age as Marlowe, was still quite incapable of framing lines of such magical music, was ringing in the ears of the younger poet when he wrote the song in the *Tempest*, and if so it is not wholly unimportant as giving another minute clue to the feeling the greatest of writers had for the wonderful creature, who, had he lived, might have grown into a greater poet still than Shakespeare. EDMUND W. GOSSE.

The Editor will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Dec. 5. 3 p.m. Physical.
 " Crystal Palace Saturday Concert (Mozart Concert).
 " Saturday Popular Concert (St. James's Hall).

SATURDAY Dec. 5,	8 p.m.	Royal Albert Hall — Popular Night.
MONDAY, Dec. 7,	10 a.m.	Institute of Painters in Water-Colours opens.
	2 p.m.	Royal Institution: General Monthly Meeting.
	3 p.m.	Asiatic.
	4.30 p.m.	Musical Association (Beethoven Rooms, Harley Street).
	7 p.m.	Entomological.
	8 p.m.	Society of Arts (Cantor Lecture).
		Medical.
		Monday Popular Concert, St. James's Hall (Hallé, Néruda, Patti).
		Royal Albert Hall—Ballad Night.
TUESDAY, Dec. 8,	8 p.m.	Civil Engineers. Photographic. Anthropological Institute.
		Royal Albert Hall — English Night (Prout's Organ Concerto, &c.).
	8.30 p.m.	Medical and Chirurgical.
WEDNESDAY, Dec. 9,	3 p.m.	Royal Literary Fnd.
	4.15 p.m.	Royal Society of Literature.
	8 p.m.	Society of Arts. Graphic. Archaeological Association.
		Royal Albert Hall: Classical Night (Beethoven's Triple Concerto, &c.).
THURSDAY, Dec. 10,	6.30 p.m.	Royal Society Club.
	8 p.m.	Society of Arts. Mathematical. Royal Albert Hall (Bach's <i>Passion</i> according to St. Matthew).
	8.30 p.m.	Royal.
FRIDAY, Dec. 11,	7 p.m.	Literary and Artistic: Anniversary.
	7.30 p.m.	Anthropological.
	8 p.m.	Astronomical. Quckett Club.
		Society of Arts: Conference to discuss "The Steps to be taken to ensure prompt and efficient Measures for preventing the Pollution of Rivers."
		Royal Albert Hall—Wagner Night (Liszt's Concerto in A — Mr. Walter Bache; Rheinberger's <i>Wallenstein's Camp</i>).
	8.30 p.m.	Clinical.

SCIENCE.

Corpus Inscriptionum Atticarum, consilio et auctoritate Academiae Litterarum Regiae Borussiae editum. Volumen Primum: Inscriptiones Euclidis anno Vetustiores. (Berlin: Reimer, 1873.)

THERE is a peculiar charm in the study of ancient Greek inscriptions, even apart from the importance of their contents. What would we not give to handle the autograph MS. of Aeschylus? Scarcely less is the pleasure of poring over a marble inscribed with a *ψήφισμα* of the Periclean age, and tracing in the forms of each letter—so simple as compared with the floridness of the Roman period, so free and graceful as compared with the angular stiffness of archaic writing, so clear and bold as compared with the minute, scratchy characters of the Macedonian age—the essential features of Athenian art and life in its noblest hour. The Inscription stands midway between archaeology and literature, combining the interest of both. It is a literary document, affording direct historical data: it is an archaeological monument, evidencing—in the forms of the letters and the ornamentation of the marble—the artistic character of its age. There are not wanting signs that the interest of scholars is being transferred from the purely literary study of antiquity to a more comprehensive field of research. There is little left for criticism to do for ancient literature: all the existing MSS. will soon have been thoroughly edited, and textual criticism will have done its work. But, on the other hand, inexhaustible stores of inscriptions lie buried beneath the soil of every part of Greece, only awaiting the curiosity and energy of scholars.

Böckh was the founder of Greek epi-

graphy. Inscriptions had been studied for centuries before, but he first raised the study to the level of a science. He reaped the first harvest of results; he edited the first *Corpus Inscriptionum Græcarum*. Since the publication of that great work, excavations and researches have been carried on in many parts of Greece, with abundant results to Epigraphy. But nowhere has research been more zealous or more amply rewarded than in Athens and Attica itself. The Greek Government has encouraged the work, and the Athenian antiquaries deserve the warmest thanks of all scholars. The Athenian inscriptions which have come to light during the last twenty years are to be counted by thousands, and illustrate Athenian history from Solonian down to Christian times. These have been published chiefly in the Athenian journals, *Φιλίστωρ* and *Ἐφημερίς Ἀρχαιολογική*, and in M. Rangabé's *Antiquités Helléniques*.

Böckh himself was keenly interested in this rapid accession of new materials, and fully felt the necessity of re-editing the *Corpus Inscriptionum*, or at least the Attic portion, by the light of the newest results. But his long life ended before opportunity was ripe for the undertaking. Accordingly, Professor Kirchhoff was invited by the Berlin Academy to edit a *Corpus Inscriptionum Atticarum*, which should contain all Attic inscriptions as yet discovered. The work will be in three volumes: the first comprises all documents prior to the archonship of Euclid; in the second volume Professor Köhler will bring the collection down to the reign of Augustus; the third volume will be edited by Professor Dittenberger, and will comprise inscriptions of the Imperial period.

The first volume—perhaps the most important of the three—is now before us, edited by the worthy successor of Böckh. It is a work of the highest value to every writer or lecturer on Athenian history. Not that it contains much material that was unknown before. Most of these inscriptions have been repeatedly published; but many were inaccurately copied till now, and many were scattered up and down in the numberless learned magazines of Europe. For the first time the student may see at a glance what inscriptions exist for the illustration of his subject.

The work is faultless in arrangement, in type, and in scholarly care. In one respect only are we disappointed, viz., in the extreme brevity of the commentary. The notes are almost wholly textual. And though the documents are so skilfully classified that they almost tell their own tale, yet he who would use this work aright should possess some previous knowledge of Greek Epigraphy. To supply this want will be a chief object in the work shortly to be issued by the authorities of the British Museum, on which the present writer is engaged. This will contain a revised text of all the Attic inscriptions in the Museum, with a full commentary and all information that an English scholar would require. Kirchhoff's *Corpus* is a classified collection of inscriptions, not a thesaurus of the latest results of epigraphic research. For these the reader is referred to other works. Yet some of the documents have never been satisfactorily dealt with. No. 322 is the well-known report of a commission appointed

B.C. 409 to survey the still unfinished temple of Athena Polias (usually known as the Erechtheum), and report on the condition of the works. Many difficulties and architectural ἀπαιτ. λεγόμενα occur in it, which quite baffle the reader; but their explanation does not fall within the scope of Professor Kirchhoff's *Corpus*. And also among the less difficult documents, the treasure-lists of the Parthenon and other temples (pp. 48–93) may be studied to greater advantage in Professor Michaelis' delightful monograph *Der Parthenon*, where every possible document relating to that temple is brought into one focus, and illustrated with no less eloquence than learning.

Those who, fresh from their Thucydides and Xenophon, approach for the first time a collection of Attic inscriptions, will probably be surprised both by what they find there and by what they fail to find. If they expect direct illustration of Greek literature they will be disappointed. It is remarkable how rarely the lines of Greek literature and Greek Epigraphy completely blend into one. Partly this is because out of the vast number of inscriptions many have been destroyed and many remain still undiscovered. There is no reason why we should not some day discover a tombstone inscribed with the name Σωφράνης Σωφρονίσκου Ἀλωπεκῆθεν, or the decree in which the Peloponnesian war was finally declared. Yet the fact remains that inscriptions do more than illustrate Greek literature—they supplement it. Unhappily the earliest Decrees are much mutilated, and yield but scanty results. No. 59, however, is the identical psephism cited by Lysias (*adv. Agoratum*, 71–72), in which Thrasybulus of Calydon and Apollodorus of Megara were rewarded for the assassination of Phrynichus by the gift of Athenian citizenship (B.C. 411). No. 37 is a mutilated decree respecting the readjustment of the tribute of the allies: and No. 33 is a fragment of a decree (B.C. 433) renewing the old standing alliance between Athens and Rhegium, which is referred to by Thucydides (iii. 86).

Far more perfect is the elaborate series of inventories of the treasures, national and sacred, which were stored in the Parthenon and other temples on the Acropolis. These furnish a wonderful illustration of Pericles' statement of the resources of Athens as given by Thucydides (ii. 13). No. 179 is part of an account of the expenses of the two first expeditions to Corcyra in the year 433 B.C. (Comp. Thucyd. i. 45 and 51). These documents show the minute care with which the Athenian democracy kept their accounts. Perhaps the most interesting of all Attic inscriptions are those known as *tribute-lists*, which give an account of the sixtieths of the φόρος dedicated yearly to Athena. Over 100 fragments, discovered at different times on the Acropolis, have been successfully pieced together by the ingenuity of Professor Köhler, and present us with the accounts from B.C. 454 to 428. Here we have authentic lists of the subject states, and of the amount of their payments. It is not too much to say that the first authentic history of the Athenian confederation was given in Köhler's *Urkunden und Untersuchungen zur Gesch. d. delisch-attischen Bundes* (Berlin,

1870). It is curious that the doubling of the tribute in B.C. 425 by Alcibiades—which Grote set aside as resting only on late authority, and contradicted by the silence of Thucydides—is now confirmed beyond question by the simple testimony of the lists themselves.

For the most part it will be found to be the value of Attic inscriptions that they yield just the information we should not have expected, while what we might have looked for they omit. Greek literature is an inadequate representation of Greek life; its complement is to be found in archaeology. Literature has its home within doors, but Greek life was an out-door existence, in the gymnasium, the temple, the agora; and the records of these scenes were inscribed on marble with marvellous care. Herein lies the value of Epigraphy. Our meaning can best be expressed by a comparison of Grote and Curtius as historians of Greece. Both have achieved a vivid portraiture of Athenian life, but they worked by different methods. Both were equally versed in Greek literature; but for its illustration Grote, for whom archaeology had no charm, relied on a keen judgment trained in the practical school of English politics. Curtius began as an editor of Greek inscriptions and writer on Greek topography; and to an imagination so schooled we owe a history which startles the reader by its bold reconstructions of ancient life.

EDWARD LEE HICKS.

Physiology for Practical Use. By Various Writers. Edited by James Hinton. In Two Volumes. (London: Henry S. King & Co., 1874.)

THIS is a popular exposition of some of the principal facts of physiology, though it touches so many points of medicine and general hygiene, that the heading might almost be exchanged for "Popular Medicine." Mr. Hinton states in the Preface, that although his name appears on the title-page, his part in the volume has been small, being limited apparently to the revision of the several papers. Pursuing a somewhat different plan from that usually followed in physiological treatises, Mr. Hinton plunges at once into the nervous system and the organs of senses, the anatomy of which is given in quite sufficient detail for such a work, whilst generally useful knowledge in regard to long and short sight, cataract, &c., is conveyed in a very intelligible manner.

As an example of the mode in which physiology is made practically useful in Mr. Hinton's work, we shall transcribe a section on his own subject, which contains an important lesson. Speaking of the cleansing of the ear, he remarks that the passage of the ear does not require cleaning by us. Nature undertakes that task, and in the healthy state fulfils it perfectly.

"Her means for cleansing the ear is the wax, which dries up into thin scales, which peel off and fall away imperceptibly. In health the passage of the ear is never dirty, but an attempt to clean it will infallibly make it so. Washing the ear out with soap and water is bad; it keeps the wax moist when it ought to become dry and scaly, and makes it absorb dust. But the most hurtful thing is the introduction of the corner of a towel screwed up, and twisting it round. This proceeding irri-

tates the passage, and presses down the wax and flakes of skin upon the membrane of the tympanum, producing pain, inflammation, and deafness. Washing should only extend to the outer surface, as far as the finger can reach."

In addition to such sensible writing as this there is at the same time in some parts an admixture of curious mystical writing that to us at least seems out of place. Thus, speaking of the sense of smell, the writer observes that "through all antiquity not a temple was erected to any god that did not smoke with continual offerings of frankincense and all sweet perfumes:" but were not such perfumes employed as a means of concealing and overpowering the vile odour of burning flesh, commonly offered up in such temples? A good deal follows of a religious cast, of which we fail to see the practical application. Nor can we admit that pleasure in sweet odours is fainter now than in past times, nor, supposing that this were allowed, that it is due to the development of music.

We notice here and there some inaccuracies. Thus (p. 2, vol. ii.), in speaking of the sudoriparous glands, it is stated that "every square inch of skin is perforated by several thousand openings, which are the apertures of corresponding glands." Now this is true only of the skin of the palm of the hand and sole of the foot, in each of which there are about 2,700 openings to the square inch; but elsewhere the number is much smaller, not amounting to more than 500 or 600 per square inch on the neck, back and thighs. Again, in the section on alcohol (p. 134), it is stated that alcohol, if not consumed, "is converted into fat, and thus appropriated to the uses of the economy." Surely this is erroneous. By undergoing combustion, alcohol may cause the fat of the food and the hydrocarbonaceous materials of the albuminous compounds to be spared, and thus lead to the deposition or storing up of fat in the body; but we cannot admit that alcohol can be "converted" into fat. The editor, however, takes a generally correct view of the uses and actions of alcohol, classing it very properly with the foods.

Taking it altogether, the book will perform its intended duty if it leads the popular mind to take some interest in the truths of physiology, and aids in spreading useful knowledge among the unlearned.

HENRY POWER.

NOTES AND NEWS.

WE understand that an elaborate memoir on the Geology of the Weald, by Mr. W. Topley, will shortly be issued by the Geological Survey, as one of the volumes of its *Memoirs*.

WE hear that Dr. Dohrn intends to make arrangements for a systematic observation of the habits of the lower marine animals kept in the Aquarium of the Zoological Station at Naples. As the collection now exhibited there is by far the largest ever made, many times as great as those of the Crystal Palace and of Brighton, which afford such inexhaustible amusement to their daily crowds of visitors, interesting and important results may be expected. Particular attention will be given to the numerous species never before kept in tanks (such as several species of Mediterranean cuttle-fish, shell fish, corals, sea-stars, electric fishes, and all those transparent animals which inhabit the surface of the sea), and

therefore never seen by any naturalist under circumstances at all approaching their natural conditions.

NEAR the village of La Celle, not far from Moret, in the valley of the Seine, there occurs a fossiliferous deposit of tufa, which has been recently visited, and its fossils described, by MM. de Saporta, Tournouër, and de Mortillet. According to the description communicated by these observers to the Geological Society of France, the tufa is a yellow concretionary limestone traversed, as is so often the case with such rocks, by innumerable winding tubes of insect-larvæ, of the genera *Rhyacophila* and *Hydropsychis*. It is believed that the deposit is of Quaternary or Pleistocene age, and according to M. de Mortillet it is pre-glacial. Among the vegetable remains, which have been diligently collected by M. Chouquet, the most notable are the leaves and fruit of the fig-tree (*Ficus carica*). From the small size of the fruit, M. de Saporta concludes that the fig had not been modified by cultivation. The associated shells are referred by M. Tournouër to thirty-four species, and with a single exception are land-shells. Most of the species are now living in the district; some, though not occurring at present in this area, are still found elsewhere in France; others again are not known in France, but are yet living in other parts of Europe; while a few of the species or varieties appear to be altogether extinct. The molluscan fauna concurs with the flora in pointing to a warmer and more southern climate in Central Europe. The deposit has yielded to the acute observation of M. de Mortillet several worked flints, including one of the Mouster type.

OUR English Chalk has recently been attracting attention on the opposite side of the Channel, two papers on this formation having been read before the French Geological Society, and published in the November number of the Society's *Bulletin*. Professor Hébert, in continuation of researches which he presented to the British Association at the Brighton meeting, has sought to correlate the subdivisions of the English chalk with his classification of the chalk of the Paris basin—a classification which is at once stratigraphical and palaeontological, and which admits, according to the author, of wide application. In the same number of the *Bulletin* M. Charles Barrois has a note on the Chalk of the Isle of Wight, which he asserts has not received from English geologists the same attention that has been bestowed upon other formations in the island. Mr. Whitaker's writings on the Chalk of our southern counties are largely quoted by both authors.

It has been determined by the authorities of the Geological Survey of Victoria that a "Prodromus" shall be published, for the preliminary description of remarkable Victorian fossils brought to light during the progress of the Survey. The work will be issued in "Decades," or numbers of ten plates each, with corresponding letter-press. We have recently received the first of these decades, which has been prepared by Professor McCoy, the Palaeontologist to the Survey. It opens with two plates of Graptolites from the slaty rocks through which the gold-reefs course; these fossils are of interest as being those that first enabled the palaeontologist to refer the gold-bearing slates of Victoria to the Lower Silurian period. In the three succeeding plates we find illustrations of fossil wombats from the gold drifts, and upon the evidence of these extinct marsupials it has been inferred that the auriferous drifts of Victoria, instead of being alluvial, are at least as old as our Crag. Following these wombats are two plates of curious Volutes, which appear to place the deposits in which they occur on that debateable horizon between the Upper Eocene and Lower Miocene, which the German geologists term the Oligocene period. Turning to plants, one plate is devoted to Mesozoic and one to Palaeozoic coal-plants; we may remark, that all the true coal of Victoria

appears to be of Oolitic and not of Carboniferous age: the *Lepidodendron* here figured having been found in sandstones unaccompanied by coal. The last plate is occupied by figures of two new species of fossil star-fish from Upper Silurian beds.

WHILE almost every important branch of science has its periodical reports of progress, it is curious that English geologists should hitherto have been without any systematic work of this kind. The want, however, is about to be supplied by the annual publication of a *Record of Geological Literature*, which will be edited by Mr. W. Whitaker, of the Geological Survey. The first volume will contain short abstracts of all papers, both British and foreign, published during the year 1874. We understand that the *Record* will probably embrace the following range of subjects:—stratigraphical geology, arranged topographically; geology as applied to mining; physical geology; mineralogy and petrology; and palaeontology.

THE last number of the *Zeitschrift d. Deutsch. Geolog. Gesellsch.* opens with an elaborate paper by Dr. H. Loretz, of Munich, in which he describes in great detail the geological structure of the country around Ampezzo, lying partly in Tyrol, and partly in Venetia. The observations on which the paper is based were made in the summers of 1872 and 1873; and the memoir has been anticipated by preliminary essays contributed by the author to the *Neues Jahrbuch*. The memoir which has just appeared is accompanied by a map of the district, coloured geologically, and by two plates of sections.

At a recent sitting of the German Geological Society, Herr Weiss exhibited a specimen of silicified wood from the Permian rocks of Mansfeld, in Prussian Saxony. Unlike most silicified wood, the present specimen presents on its surface well-preserved sculpturing, thus affording ground for the formation of a new species. It is described as *Tylodendron Saxonicum*.

ACCORDING to Herr F. Römer, of Breslau, the skull of the musk-sheep (*Ovibos moschatus*), the most Arctic herbivorous mammal, has been detected among fossils from the Pleistocene loams of Silesia. The discovery is of some interest, in consequence of the limited occurrence of this species in Germany, three localities only having hitherto yielded its remains.

It seems to be proved beyond doubt that a true *Lepidosteus* lived in the waters of the Paris basin during the early Tertiary period. M. Paul Gervais has recently announced that the ganoid fish from the Paris beds, described by Agassiz as *Lepidotus Maximiliani* should be referred to *Lepidosteus Suevionensis*. This correction is based upon the recent discovery of abundant fish-remains, including vertebrae, at Neaufles, near Gisors. It is well known that the genus *Lepidosteus* stands unique among fishes in having the bodies of its vertebrae not biconcave, but slightly concave behind and convex in front. The fossil vertebrae from the Paris basin possess precisely similar opisthocœlus characters.

In the last number of the Geological Society's *Journal*, Mr. L. C. Miall, of Leeds, describes some remains of *Labyrinthodonta* from the Keuper Sandstone of Warwick. The Warwick Museum possesses nearly all the fragments of Triassic *Labyrinthodonta* hitherto discovered in England; and Mr. Miall, having carefully studied this collection, is able to offer a critical examination of the fossils, and a revision of many of Professor Owen's former determinations. In connexion with this subject we may call attention to the admirable report on the structure of the *Labyrinthodonta*, drawn up by Mr. Miall, and recently printed by the British Association in the Report of the Bradford meeting.

On Tuesday, November 24, the Geological Society of Manchester held the first meeting of the present session, when Mr. W. Boyd Dawkins,

the newly-elected president, delivered the opening address. In this address he gave a brief analysis of some of the most recent additions to our knowledge of geology in its relation to mining, engineering, and terrestrial physics.

THE botanical results of the exploring expedition in North-Western Wyoming, under Captain W. A. Jones, have recently been published by Dr. Parry in the *American Naturalist*. Not many new species were discovered, but a great number of interesting plants collected by Nuttall, and only represented in herbaria by unique specimens, were re-found. The tract explored comprises the Green River basin, the southern spurs of the Wind River range, and the Big Horn and Yellowstone River basin, including the National Park. Only fourteen new Phanerogamia are described, and six new or rare Cryptogamia. No absolutely new types were discovered.

THE Royal Society of Arts and Sciences of Mauritius, which has been in existence for forty-two years, have sent over the seventh of the new series of their Transactions, which contains an account of the work done up to May, 1873. The contents are chiefly zoological and botanical. One of the papers is on the *Vacoas* growing in the island of Rodrigues, a place to which special attention has lately been directed, on account of the station there of the Transit of Venus observers.

Der Naturforscher gives an account of observations on the tone of waterfalls made by Herren A. and E. Heim, and communicated to the Natural History Society of Schaffhausen. They say a mass of falling water gives the chord of C sharp (C, E, D) and below these notes the non-accordant F. When C and D sound louder than the middle note, F is heard very fully. It smoothes the pure chord of C sharp, so that it is no longer heard as a concord but as a clear rushing noise. The F is a deep dull humming far-resounding tone, strong in proportion to the mass of the falling water. It can be heard round rocky corners or through thick woods, and at a distance at which the other notes are imperceptible. Besides F, C and G are heard. E is always weak, and the ear scarcely recognises it in small falls. The notes C, E, G, F, belong to all rushing water, and in great falls often in different octaves. Small falls often give the same tones one, two, or three octaves higher. No other tones can be found. In strong falls F is the easiest to hear; in all weak ones C. On first attempts to distinguish the notes, C is usually the most readily recognised, and as each note is accompanied by its octave, it is often difficult to decide which C, G, or F is heard. Persons with musical ears attempting to sing near a rushing water spontaneously use the key of C sharp, or of F sharp if near a heavy thundering fall. Other keys give an ugly discord. Experiments with other fluids are suggested to see if they give notes differing from those of water.

ACCORDING to *Der Naturforscher*, Herr W. Hoffmeister has investigated the movements of the threads of *Spirogyra princeps* (Vauch), one of the fresh-water Algae. Placing a thick bundle of the *Spirogyra* in a glass vessel, he noticed that after being quiet for a minute or so, single threads crept out on all sides bending themselves in all sorts of ways. In from one to two hours all separated and spread themselves pretty uniformly through the water. In three hours some of the threads began to climb up the side of the vessel. They kept both ends in the water and curved the middle part so as to project above the surface. Thread joined to thread in this position, forming groups all round the glass, the projecting parts being 25–33 mm. above the surface of the water. Light was not found to affect this movement, which could be carried on in complete darkness. Single threads placed in a porcelain dish with a flat bottom showed the movements to consist in bendings and straightenings in one plane without any axial rotation. The movements are not constant. For a quarter or half an hour the threads may remain in one place, or move so little that

it can only be detected by using a micrometer, and then suddenly spring into activity. The movements occur through changes in the dimensions of the cell membrane, and as that possesses a double refractive power, Herr Hoffmeister examined it with a polarising apparatus and found its growth lengthwise to occur "in a very broad zone of the side surface except in a narrow ring-shaped region bordering on the partition walls." The motion is thus produced by unequal longitudinal growth of the sides of the threads.

In a letter to Mr. Langley, published in *Comptes Rendus*, October 12, M. Faye returns to his question of the resemblance between sun spots, whirlwinds, and cyclones. He attributes the unwillingness of astronomers to accept his views to want of sufficient knowledge of the terrestrial phenomena, which he says have not, on account of their complication, been sufficiently studied mathematically, and which he considers have been regarded far too superficially. Since Carrington's discovery of unequal velocities in contiguous zones of the sun's photosphere, gyrotory currents would be expected in the sun by any one familiar with hydraulics. He points to an essential distinction between gyrations with horizontal axes, or axes variously inclined, and whirling movements with vertical axes. The first, he says, are unstable and tend to form spiroidal layers in fluid masses, which are soon decomposed and destroyed, while the second can take a regular geometrical figure and are astonishingly stable. He does not wish to exclude the former movements, which are commonly recognised as tumultuous, from consideration, and he recalls an experiment he formerly exhibited to M. Plateau showing that movements of that kind combined with the properties of liquid films give rise to emulsions of fatty bodies in serous fluids, which may be decomposed by other modes of agitation. He considers that a new chapter of mechanism should be written devoted to gyrations with vertical axes, whirlpools, waterspouts, typhoons and cyclones, and lastly sun spots. This paper must be taken in conjunction with the explanations in *Comptes Rendus* for August 3, in which M. Faye gave elaborate explanations of a series of drawings which he now states will be published. It would exceed the space we can give to the subject to attempt a *résumé* of the two papers, but the following passage from the last one will explain the main facts on which he relies. He says:—

"If a powder is thrown into a natural or artificial whirlpool, its form becomes visible, and it is seen to be that of a reversed cone elongated downwards like a funnel. It will be noticed to produce a circular and conical depression on the surface of the liquid, which changes to a jet (*saillie*), quickly effaced when the whirling ceases, and the surrounding fluid flows towards the axis to re-establish the equilibrium. The observer will be able to verify the angular acceleration of particles as they approach the axis, and also that the motion is propagated from above downwards, and the force stored up in the vortex is finally transported to the base and exhausts itself in a raking movement. Not only are the dust particles carried downwards, but, as General Morin has shown, swimmers and even vessels, or, according to M. Belgrand, ice-flakes, are violently drawn into this sort of gulf, which only permits their re-ascent after having swallowed them up. A still more perfect representation may be obtained by De Maistro's plan of throwing oil upon the water, when it will be carried downwards and re-mount in bubbles round the whirlpool."

THE *Journal of the German Oriental Society* (xxviii. 1) contains a number of interesting papers. Bacher contributes some critical enquiries into the Targum of the Prophets, from which he concludes that the variants in the Codex Reuchlini belong to the older translations before the present text had been stereotyped, adding that the same holds good for the Targum on the Pentateuch of the fragments of the Jerusalem Targum. Blau gives a Palmyrene inscription and bas-relief commemorating two children, Hübschmann some

contributions to the explanation of the Avesta, and Prätorius discusses the meaning of four Assyrian words. Noldeke determines the position of the Babylonian town Vologresias and other points of Oriental geography. Aufrecht examines the commentaries on the Amarakosha, and Schrader criticises the translation of Assyrian passages given by Prätorius in the preceding number of the *Journal*. Stickel describes six gold coins of the Il-khane, and Wright sends a note on the Phœnician inscription Melitensis Quinta, together with a copy of it. Notes and correspondence fill the rest of the *Journal*, among which may be mentioned an attempt on Schlottmann's part to uphold the genuineness of the "Moabite" pottery.

DR. DONNER'S "Comparative Dictionary of the Finnic-Ugric Languages" (*Vergleichendes Wörterbuch der Finnisch-Ugrischen Sprachen*) Part I. which has lately been published, will need no recommendation to Turanian scholars; but the general philologist, who is less likely to be acquainted with it, will find in it much that is interesting and valuable. The author hopes to bring out the Second Part of the work before the end of the present year, and will follow it up by a review of the Finnic suffixes with all their phonetic changes. It is a fortunate omen for philology that attention is being at last turned to the Turanian languages, since it is in them that many of the secrets of speech are locked up. Scientific works like the one before us are doing the work that Diez has done for modern Romanic, and Curtius for ancient Aryan, and are laying a sound basis for the prosecution of researches which the discovery of Accadian has opened up. One of the facts brought out in this Comparative Dictionary is that the Ugrian roots are not the crystallised entities they have been supposed to be, but that they display a weakening and strengthening of the vowel of the root similar to the weakening and *guna* of Indo-European grammar. Dr. Donner not unfrequently quotes roots and words from Samoyed, Turkish, and Mongolian, which may be compared with those of the Ugrian dialects. His arrangement is excellent; in fact, nothing can be clearer than the system he has adopted.

MEETINGS OF SOCIETIES.

SOCIETY OF BIBLICAL ARCHAEOLOGY (Tuesday, December 1, 1874).

S. BIRCH, LL.D., F.S.A., President, in the Chair. The following papers were then read:—1. "On a Mythological Inscription on the Tomb of Seti I. at Thebes." Par Edouard Naville, Genève.—In this paper the author begins by referring to the primitive deification of physical causes, and their gods then influencing human affairs, whereby (with the aid of the poets) mythology became so interesting to its believers. He obtained squeezes from the original inscriptions at Thebes, formerly known to be perfect, but now mutilated by the Arabs, who nocturnally abstract pieces for sale to tourists, in spite of the Khedive's orders to the contrary. This inscription, which belongs to the *archaic* period, represents Ra, as the creator of mankind, being so disgusted with their insolence, that he resolved to exterminate them: but previously convokes an assembly of the other gods to take their advice; his father Nun in this council on their behalf urges him to this step, and the goddess Tefnut descends as Hathor for that purpose. The massacre makes human blood flow to Heliopolis. Ra afterwards repents, and orders certain deities to drink up the inundated country; to gather at Elephantine a quantity of fruits, which, mixed with the said human blood, fills 7,000 vases, the sight of which number rejoices Ra, and the human race reappears. Ra swears with uplifted hand not to kill mankind again. These offer their warrior aid to Ra against his foes, the barbarians of the date-fields at Anu: who are subdued. Ra soon tires of human society, re-ascends fatigued into heaven on the back of the Cow-transformed goddess Nut:

previously granting to his favourite Thoth a field with Aalu flowers; the ibis and cranes; the solar and lunar orbs and stars, &c., which appear immediately at his wish. He also gives commands to Seb with regard to the serpents he carries about him. M. Naville points to the separation of the human race, who drank from the Nile-water, from others who drank from well-water, as indicative of the outside Libyans and Arabians from the true Egyptians. He suggests that the latter, as Typhonian men, were not extinguished, and thinks human victims were originally sacrificed as Typhonian foes, and pleasing to the great god Ra. The inscription concludes with precepts for the purification of the intending reader of this most sacred record. He quotes Plutarch, Porphyry, and Seleucus as authorities for human immolations at Heliopolis, which this record, he supposes, was to abolish. The resemblance to Jupiter commanding Saturn, and scriptural analogies, is very striking.

2. "On a Monument of Haremhebi." By S. Birch, LL.D.—The paper contained an account of an inscription relating to the coronation of the monarch Haremhebi, or Horus. The principal points of interest are the mention of the ceremonies in honour of the king, and his restoration of the worship of the god Ammon, which had been overthrown by the heretical worshippers of the sun's disk. The endowments of the temple of Ammon at Thebes, Heliopolis, and Memphis are also alluded to in the inscription.

GEOLOGICAL SOCIETY (Wednesday, Dec. 2).

J. EVANS, Esq., F.R.S., President, in the Chair. A femur of a new Dinosaur, found in the Oxford Clay of Great Gransden, Cambridgeshire, was described by Mr. H. G. Seeley. The bone is in the Woodwardian Museum at Cambridge, and is the only known specimen. Mr. Seeley has given to this undescribed Dinosaur the name of *Cryptosaurus eumerus*. Dr. H. Hicks, having continued his researches on the old rocks of Pembrokeshire, read a paper "On the Succession of the Ancient Rocks in the Vicinity of St. David's." A ridge of metamorphic rocks, perhaps of Laurentian age, with a north-east and south-west trend, forms an antichlinal axis; and on the slope of this ridge there lies unconformably a vast series of rocks extending from the Longmynd to the Llandeilo groups, without any well-defined interruptions. The Longmynd group is succeeded by the Menevian, which has been so well worked out by Dr. Hicks, and these two groups may be taken to form the Lower Cambrian series. The Menevian rocks are followed by the Lingula flags, and these by the Tremadoc group. Above the Tremadoc come two great series, which, not having been previously studied in detail, were specially described in the present paper. The lower group, for which the author used Professor Sedgwick's term—the Arenig—consists mainly of black slates, capable of division, on palaeontological evidence, into three sections—an upper, a middle, and a lower Arenig group. Lying upon these slates are the Llandeilo rocks, also capable of arrangement in three stages. The lowest group consists of black slates, interstratified with volcanic ash; the middle group of calcareous shales and flags, associated with compact limestones; and the upper group, like the lower, of slates and eruptive rocks. A large number of fossils have been obtained from these ancient deposits, showing a richer fauna than had been previously known on these horizons. They are chiefly graptolites, trilobites, and brachiopods, and include many new species. The paper naturally reopened the old controversy as to where the line should be drawn separating the Cambrian from the Silurian system. In spite of slight palaeontological breaks, at the top of the Menevian and top of the Tremadoc groups, it was maintained that the whole series formed one grand natural system of rocks.

FINE ART.

THE SOCIETY OF BRITISH ARTISTS.

It would be difficult to imagine a more vacuous and purposeless exhibition than the one which opened in Suffolk Street on November 30—purposeless save that bad painters, after producing their objectionable works, feel a natural desire to sell them, and somehow, we suppose, they find, to some considerable extent, a market in this Gallery; though who the purchasers can be is a question to puzzle one before the solution comes, and to make one low-spirited afterwards. The number of exhibited works, in oil and water-colour, is no less than 907.

The best of the figure-pictures in oil is, no doubt, the *Ecclesiastics* of Mr. Calthrop, representing the friars of a Franciscan convent accompanying a church dignitary, who has come to conduct the service, and to make a visit of inspection. The brush-work of this picture is equally easy and efficient, the groined stone-surface solid and in good tone, and the figures well characterised both singly and as a group. Mr. Calthrop has a safe future before him, if only he will avoid repeating one class of subject till it becomes threadbare and mechanical. After this it is not easy to find anything else to mention with decided encomium; certainly not the large figure of a woman, or "nymph," robed in white, painted by Mr. J. H. Walker, and named *Preparing for a Festival*. Mr. W. A. Walker sends another of the less insignificant figure-pictures, *Nel dolce tempo della prima etade*; a sort of classical idyl, in which a nude youth of some fourteen years of age has been blowing bubbles, accompanied by an almost equally nude girl of like age. In such a collection as the present, this work deserves mention, but cannot secure commendation. Mr. H. Alabaster sends a composition of Iphigenia proceeding to the place of sacrifice. This appears to be the work of a beginner, and is in some degree promising. The grouping is better than merely commonplace, and the intention is serious, aiming both at simple nature and at grace. The handling is flat; the colour, if neutral, not unpleasing. Another smaller picture by this gentleman, *Ruth*, has no importance. *Summer Eve in the Garden of a London Hospital*, by Mr. Bauerle, is not wanting in appropriate sentiment, and is otherwise agreeable—least so in colour. *The Fisherman's Maid* is an odd performance by Mr. A. Thompson—not a good one. We see here a Japanese or Chinese damsel, far from correct in ethnical type, standing to angle on a stone in the shallows of a measureless river; on another contiguous stone, a white stork poses upon one leg. Mr. Morgan, as usual, contributes works of a humorous or matter-of-fact character. The best of these is named *The Times*: it portrays the interior of a country-town hotel, overlooked by the town-hall: a farmer is expressing to a clergyman his views of public affairs, consequent upon the reading of the morning's newspaper. This picture is cleverly lighted, and is in other respects a sober, accurate, and successful piece of work. Another painting of very considerable excellence in point of literal and facile truth of expression is *An Incident during the Shah's Visit*, showing a number of more or less ragged boys who have climbed a tree, and are bawling out their uncouth salutations to the (here unseen) potentate. The composition of this picture, necessarily peculiar, is quite good enough to match with its expression: but the whole thing is made repulsively ugly, the colour being more particularly at fault.

In this gallery there is a very large proportion of female exhibitors, and they, on the whole, compare well with the males. We can cite Miss M. Backhouse, *Girl with Strawberries*, a rather large picture, not unskilful; Miss E. Mitchell, *The Departure*, showing a lady who is about to descend the moveable platform which leads down to the deck of a steamer at Boulogne, or some such French sea-town; Miss B. Meyer, *The*

Duchess of Gloucester doing Penance, in which, though the executive power is of the most rudimentary kind, the incident is well conveyed in some of its details; Miss A. Smith, *Give us this Day our daily Bread*, a picture carefully painted, and not so absolutely squalid as to cease to be pathetic, representing two miserable children, a brother and sister, who pray in their garret before going out on their quest after pence, the boy as a crossing-sweeper, and the girl as a flower or watercress seller; Miss M. Godsall, *Fioretta*, a large head of a warm-complexioned girl about sixteen years of age, in which the look of fresh-natured *naïveté* is pleasantly conveyed; Miss M. Thomas, *The Fisherman's Daughter*, well modelled, and in other respects careful. When we proceed to the water-colour section of the figure-subjects, we still find the ladies active; see the female head by Miss F. Sothorn (No. 672); *The Spanish Fruit-seller* of Miss E. Alldridge, an audacious sort of large glowing sketch, not free from slovenliness, yet showing perception and talent; and the *Juliet* of Miss M. James, which we may observe cannot surely be meant for Shakespeare's Juliet. Still among the water-colours, we come upon one of the best things in the exhibition, Mr. Donaldson's *Love-Song, Time of the Thirty Years' War*: picturesque in its treatment of the ancient German town, and the serenading party, and flushed, as usual in Mr. Donaldson's work, with the richest hues of the palette—not, however, on the whole, among his happiest performances. *The Politician*, by Mr. Ker—an old man with his newspaper—is creditably done.

Two of the principal landscapes (oil-colour) are by Mr. G. Harvey and Mr. C. L. Jones. *A Riverside, Morning*, by the former, shows the matin mist and coolness of a summer day which will be hot ere noon, and a woman raking hay; the impression of the scene is true, but the execution is not carried far. Mr. Jones's *Scene on the Stour, Winborne*, far the better of the two, is wrought with a strong, precise hand, and a good faculty of realisation; we see the narrow river crossed by a contrary tangle of weeds, its flat and curving banks, and the distant church. The following also deserve inspection:—Penstone, *Devy Eve*, farm-buildings and calves, small and well handled; W. L. Wyllie, *Le Palais du Franc, Bruges*, and *View of Ghent*; C. W. Wyllie, *The Summer of St. Martin*, and *Ambleuse Harbour* (these four small works look exceptionally artistic amid their surroundings here); Peel, *The Mawddach Valley, North Wales*; Garraway, *A Breton Religious Procession, Pont Aven, Finistère*—a landscape with figures arranged with a right sense of the picturesque; Aumonier, *Departing Day*; Britten, *The Hidden Path*, in which we see a lady in a litter, with two horsemen, winding up a secluded road which slopes upwards from near the sea-shore—a well-designed and interesting little picture; E. Ellis, *Autumn Fields*, grey and harmonious in its unobtrusive colour, the handling rather too hurried; A. H. Moore, *The Entrance to Loch Rian*, the work apparently of a young executant, good in diffused but subdued light; Langdale, *Sunset on the Heath*; J. W. B. Knight, *A Welsh Farm among the Hills*, with numerous pigeons, and a true air of rural remoteness; *Twilight at Crickieth*, simple and dignified in tone and handling; T. J. Ellis, *Birnam Hill, Perthshire*; Hayes, *O'er Moss and Fell*; Yglesias, *Evening of Life, Norwich*, good in tone and keeping. Four of the more interesting water-colour landscapes are the *View of Ludlow from the Old Bridge*, and *Street in Ludlow*, by Mr. Donaldson; *On the Coast at Tovey, North Wales*, by Mr. Rudge; and *Scene of the late Explosion in Regent's Park*, by Miss Turck.

Mdme. Arendrup exhibits *Sheep in the Desert, Sunset*, which, without special merit, has an uncommon aspect, suitable to its subject. *She had so many Children she didn't know what to do* is a somewhat quaintly amusing picture of a duck and her brood on the water, by Mr. Dollman; and

Caught in the Act, by Mr. Charlton, treats forcibly the wrangle of two dogs over a bone. *A Mouse-trap*, by Mr. Childs, is a well-painted presentment, in water-colour, of a barn-owl watching a mouse, its purposed prey. *The Study of Honeyuckles and Roses*, by Mrs. Stillman, shows the superiority, especially as regards colour, with which floral material can be treated by a lady whose gifts in figure-subjects of an elevated class have often been evinced. W. M. ROSSETTI.

THE MEDAL FOR M. COROT.

Paris: November 23, 1874.

I have once already spoken of our great and beloved landscape-painter Corot, *à propos* of the medals awarded by the jury at the last Salon. Public opinion was unanimous in selecting for the gold medal an artist in his eightieth year, who exhibited two landscapes which may be reckoned among the freshest and noblest of his works, and the whole of whose life has been spent in the pursuit of art, unsullied by intrigue or unworthy concession.

The jury is elected by a special electoral body, composed of members of the Institute and of their pupils, of artists who have received decorations or medals—in fact, of a body of men which, feeling itself superior to the public and even to the administration, and voting by ballot, can commit any excess of power with impunity. Its presidents, with two members chosen by lot from each section, awarded this gold medal to M. Gérôme.

I have no leisure at the present moment to pause to discuss M. Gérôme's work. The opportunity will come some day. I shall criticise it the more severely in proportion to the commanding and profitable position which M. Gérôme has secured at the Institute and the picture shops. Suffice it now to say that M. Gérôme had so little reckoned on such an excess of honour that his first wish was to decline it. He has been overwhelmed with medals at every exhibition. These pictures were, both in size and subject, very second-rate specimens of his work. He was fully aware that such a distinction would centre upon him the impartial eyes of criticism, and that he would be stripped of some of his plumes thereby. He accepted, according to rumour, to gratify his father-in-law, the head of the house of Goupil, the wealthy picture-dealers. But I am inclined to believe that he wished to avoid exposing too openly the fault just committed by his *confrères* through excess of zeal. Had he done so, he would have given the final blow to the present constitution of the jury, already seriously menaced, and would have got into trouble with the administration, which had been very deservedly galled by the refusal of an independent jury to award him the "prix du salon" newly established by M. de Chennevières.

Our press rang with the scandal, for a scandal it was. The medal of honour is, according to the terms of its institution, to be awarded to the author of "the most eminent work of the Salon." The Director of Fine Arts undertakes to have it engraved. There was clearly shown the great danger to the State of yearly interference with artists and their affairs. The multitude cannot but understand that the State delegates its rights to a jury, and endorses all that jury's verdicts. What were the feelings of the public which pressed round M. Gérôme's three pictures, all three commended by a large placard to its very best attention? Why, said they, they are constantly talking to us in official documents, in books patronised by the ministry, in semi-official papers, of "high art," i.e., of an art which seeks only for heroic subjects, and represents them on large surfaces, and here is the State rewarding by the vote of its special jury mere anecdote painting—a *Frederic the Great* with mud on his boots, a hump-backed *Molière*, and a *Father Joseph* coming down a staircase in a boulevard melodrama. Why, added the public, does not independent criticism

declare again and again that the greatest artist is he who joins most heart to most science, who is ever saturating himself with the study of Nature, who creates a tradition instead of being in craven subjection thereto; who sees in his palette a means of expression whose material conditions are closely allied to the moral beauty of the work? and have not the artists who form the electoral body crowned works the meaning of which can only be guessed at with the help of a printed explanation—works which do not even make historical characters their central point, and bring them before us in a burlesque form; works which are less like painting than the toys that convicts carve in cocoa-nut during their leisure hours, and the colouring of which violates every law of the grammar of art?

So said the public. Immediately the admirers of Corot and the landscape-painters, who had felt the cruel blow which the Institute or its clients intended to strike at landscape-painting by its rejection in the person of one of its most illustrious living representatives, the admirers of Corot and artists of character opened a subscription for the purpose of presenting the master with a medal. Under the Empire the subscription would have been a failure. This time—we mention it as a little indication that the French character is growing loftier and more robust—it has produced more than 4,000 francs. We have already received remittances from England, with letters that increased their value twofold. Your countrymen have recognised the fact that genius is an international inheritance. I hope that fresh subscribers will yet add their names to this list, which will be copied on parchment and presented to the aged master to be preserved by him and bequeathed to his family as a patent of nobility. Subscriptions will be received in London by M. Durand-Ruel, or by any French artist, who will send us the amount before December 15.

During the last few days the Committee has assembled to arrange the final details. Its composition was as follows. The president was M. Marcotte, an amateur and old friend of Corot; its members, Jules Dupré, the stirring landscape painter, who gives his works the stamp of such deep emotion; Charles Daubigny, who has often gone to paint the Thames below London; H. Daumier, the great caricaturist, who has lately all but lost his sight, and who, not satisfied with his powerful lithographs, also paints in water-colours and oil; Arthur Stevens, lover of the elegances of modern life; Roybet, whose genius as a colourist is ridding itself by degrees of too strong contrasts; Edouard Frère, whose sentimental scenes are known to you; and lastly, the writer of these lines. An old friend of Corot, a sculptor, M. Geoffroy-Dechaume, brought to the meeting the model of a small medallion after the taste and tradition of the scarce and beautiful medals of the end of the French Middle Ages; that is, in high relief delicately modelled, and more simple in style than the always pouting medallions of the Pisans and the Paduans. On the reverse is a palette with a crown and a branch of laurel, and an inscription. On the obverse is the profile, energetic, expressive, and gentle, of Corot; his ear pointed like that of a faun; his projecting forehead the seat of absolute conviction; his eyes bent into a glance now frank as that of a child, now resolute as that of a good workman; his lips half-open; his powerful jaw and his colourless and silky hair, which softens what we might term the too-pronounced expression of the face, were it not for the plays of feature which modify it from moment to moment, like clouds passing between the sun and a landscape.

Corot is candour and firmness itself. No man is so easily moved; but nothing in the world has availed to induce him to paint otherwise than he paints; neither penury, nor rejection at the hands of the juries, nor the denial of his talent and his method for forty years, nor the insulting counsels of pedantic criticism, which was per-

petually dinning in his ears that he was wanting in finish, nor the league of great dealers to prevent his works from finding their way into the great collections. His rehabilitation, which only dates from ten years back, has neither infatuated nor astonished him. His only mistake is in putting forth too many sketches, which are full, indeed, of exquisite suggestions, but would have required a few hours more to pass into the stage of complete pictures. Now, when they are placed in his hands, he acknowledges as much, and touches them up with a delicacy incredible in one who bears the burden of eighty years.

His conversation is typical. One day I was praising the lightness of his foliage. "Yes, yes," said he; "the birds must be able to fly through the branches." Another day I saw at his house a young merchant from Bordeaux, who—partly, no doubt, on the faith of some critic—had asked him for a picture to be placed among his bride's wedding presents. Corot, after keeping him waiting for two years, at last gave him the picture. "You see, sir," said Corot, skipping about in the studio, dressed in a long grey blouse, with a little striped cotton cap on the top of his head, and a pipe in his mouth, "you see, sir, it is Nature celebrating her bridal." In fact, it is *Spring—Floral*, as the republican Calendar had it—dawn still enfolding the distant hills with the mists of morning, the water rippling beneath the warm breeze, the woods awaking to the song of birds. Nothing could express more powerfully the promise of a happy day. For two years had he been seeking for this motive, so tenderly allegorical.

His language is wonderfully full of imagery. He exaggerates like a woman bent upon lying. He told me one day that noises in the country are much louder than all the noises of the town. True; but this is how he proved it: "I was seated under some willows on the bank of a stream; I was quietly painting; when suddenly I heard a thunder-clap! It was a swarm of bees that had just settled on the willow branches above my head." Corot's whole self may be perceived in the quality of these sensations and recollections.

He is returning from the country to settle at Paris. He has brought back studies as fresh and as firm as those of his prime. But he is visibly depressed. The death of a deeply-loved sister has been a great blow. Once so active, smiling and chatty, he remains in his chair with his arms hanging down, speaking of the sad things that await the aged. When M. Marcotte told him that we wished to present him with this medal at a banquet, and when it was proposed also to organise a regular exhibition of his works, he withdrew from these proofs of cordiality and esteem on the pretext of weariness. But we must hope that his astonishing vigour of frame and constitution will enable him to triumph over this momentary crisis.

Though he declares himself the pupil of Bertin, one of the most utter nullities among the classical landscape-painters of the Restoration, though he went to Italy in 1826, and spent long years in the country, and though he brought back with him a certain portion of that academic bad taste which infected the Flemings in the seventeenth century, and almost all our own artists, like a malaria, Corot's genius is essentially the child of the races of the North. He has our inquisitive passion for mists pierced by the sun. His imagination delights to follow men and things beyond the limits of vision, into those distances or beneath those shadows which magnify them or swallow them up. He has the notion of those four seasons, unknown to the men of the South, especially the notion of Spring, the most heart-stirring of all, the most fruitful in intellectual activity, the secret of the infinite charm of the great romantic writers in France and England. He adores light, but light diffused, and without sharpness or brilliancy. He sees beauty in mass rather than in detail. His work shows in many points an astonishing affinity with the musical work of Weber.

What he brought back from Italy, although executed at the time of life when a man's powers are in full activity, is less great, less complete, than what he has painted in France, especially in the suburbs of Paris, whose lilac sky streaked with white clouds he has caught so well. Still I have seen the Mediterranean as I see it at the present moment in a little study made at early morning, in 1834, on the shores of the Gulf of Genoa: the strand and the water are light and creamy, like iced *café au lait* in a crystal cup. But I prefer him in this scholarly, supple, firm, and subtle study of the Pont de Gretz, a village near Fontainebleau. This painting seems to follow as if by magic the course of Apollo's car. The heaven is soft as a plate of silver-gilt slightly worn. In hours of melancholy, when the brain and hand are weary, when one is lost in building castles in the air, and in bitter memories, this landscape continues to live. Wonderful phenomenon! this heaven throbs and vibrates like my floating thought, while the real sky, of which I catch glimpses above the roofs between the chimneys, shows nothing but dead tints floating on a pale background.

I have seen in England, at the Royal Academy Exhibitions, and in his own studio, to which Frederick Leighton had taken me, a landscape painter who recalled Corot. It was Mason. But the figures which he introduced into his effects of sky and wide landscape, though otherwise nobly poetical, tended too much to distract the attention to their own profit.

I will not exhaust to-day all that might be said of this master, whose position is henceforward marked in the history of our school. His work is like those exquisite liqueurs which are only to be quaffed in small draughts.

As I have a blank page, and as there is no other important news in art, I will take the liberty of mentioning an event of some literary interest.

M. Auguste Vacquerie, the witty and courageous editor of the *Rappel*, has just published, in an octavo volume, a piece which in 1848 obtained the honours of a great failure. It is this *Tragaldabas*, "a facetious drama" in its first ultra-romantic text, now a fanciful comedy, highly amusing, highly original, and vastly superior in form to all those *bourgeois* comedies which for twenty years have occupied the stage at the Théâtre Français. M. Vacquerie, after an interval of six-and-twenty years, has now thoroughly recast it, without, however, modifying the original conception.

Tragaldabas is a being full of vices, sensual, a wine-bibber, gluttonous, a babbler, a little of a thief, and a great deal of a coward. He is, to outward appearances, the husband of Dona Caprina, who is not really and truly his wife, but his cousin, a young girl of Cadiz in fabulous times, who, in order to select a husband at her leisure, has assumed this character of a married woman. Her supposed condition attracts all the gallants to her side, and allows them to speak without disguise. A young lord, sceptical and handsome, Don Eliseo, hovers round the beauty like a moth round a candle. Far from wishing to see her become a widow, he takes the utmost care of Tragaldabas, and even fights duels for him, for the more sense of protection the fool feels, the more recklessly he embarks upon improbable and dangerous enterprises. It is in the development of this character and situation that the whole point of the comedy consists. In the end love triumphs, as it ought, over all their tricks. Dona Caprina is smitten with a serious passion for Eliseo, who no longer shuns marriage with her. Tragaldabas is allowed to plunge into a frightful affair with a Matamore, Don Minotoro, whose mistress he is courting, and who satisfies himself for the first time with chopping off one of his ears. To get rid of the puppy, some money is thrust into his pocket, and he is sewn up in the skin of an ass—a witty ass, which would make the fortune of any company of mountebanks.

In 1848, Frederick Lemaître exaggerated the burlesque side of his part. He went so far as to come on the stage after a real and prolonged *tête-à-tête* with several bottles of wine. The public flew into a passion with author and actor at once. The uproar was indescribable. In vain M. Vacquerie had in the theatre Victor Hugo, Théophile Gautier, Balzac, Champfleury, Théodore de Banville, M^{me}. George Sand to back him; the piece was performed once only. It was afterwards assailed with the grossest insults. One must read it to judge how artistic and original it is.

Last year M. Vacquerie published a volume of highly original poems entitled *Mes premières années de Paris*. He is a man of very agreeable manners. He has always loyally obeyed his convictions. When Eugène Delacroix was the victim of the most triumphant calumnies of the Academicians, his pictures found a purchaser in M. Vacquerie. Justice has come. He now possesses a collection of masterpieces, which are worth a thousand times the price he paid for them. He will not part with them. PH. BURRY.

ART SALES.

ONE of the most important sales of prints that have occurred for a considerable time was that held by Messrs. Sotheby, Wilkinson and Hodge, on Friday and Saturday of last week. It consisted of the second portion of the collection formed by Hugh Howard at the beginning of the last century, and included no less than two hundred and twenty examples of the etchings of Rembrandt. A few drawings by Old Masters were also included in the sale. One, which was ascribed to Rembrandt, and which agreed in subject with the right-hand portion of one of his most famous prints—*The Large Landscape, with Cottage and Dutch Barn*—fetched 17 gs. A sheet of studies by Albert Dürer for a well-known engraving—that described by Bartsch as *La Sainte Famille au Papillon*—was knocked down at 31l. A drawing of Claude's—a study for one of Sir William Miles's pictures at Leigh Court—was knocked down at 22l. But the interest centred in the etchings of Rembrandt. Twenty of his own portraits were offered for competition. Of these the finest seemed that portrait known as *Rembrandt Leaning on a Stone Sill*. It is one of not many portraits of himself in which he has mixed grace with vigour and thoughtfulness. The impression sold was in the second state, and was knocked down to Colnaghi for 43l. The collection, though pretty strong in Rembrandt's portraits of himself, was comparatively deficient in fine examples of his portraits of other men. There was no *Uytendogaert, the Goldweaver*, nor was there an *Ephraim Bonus*, nor a *John Lutma, the Goldsmith*—this last being among the very finest of Rembrandt's works. But in sacred subjects the collection was rich. The highest price attained at all during the sale was that given for a magnificent first state of *Christ before Pilate*. The print in the first state is of the greatest rarity, and this was a most brilliant impression on Japanese paper. It was knocked down to Holloway and Son for 251l. There were two remarkable impressions of one of Rembrandt's greatest works, *The Crucifixion* (No. 81 in Wilson's Catalogue of his prints). The first, a first state on vellum, sold to Colnaghi for 211l.; the second sold for 71l. to Mrs. Nosedá. Danlos, the Parisian print-seller, bought an impression of *The Hundred Guilder Print*, in fine condition, for 106l. This is the famous work of which a first state has been sold for about 1,100l. A most noteworthy copy of it, by Leopold Flameng, is probably by this time known to many readers. Among the Pious Subjects, a *Saint Jerome, seated, reading* was acquired by Colnaghi for 43l. The Beggar Subjects and Miscellaneous Subjects did not realise such high prices, but 24l. 10s. was obtained for *The Onion Woman*, probably because De Clausius,

the early French catalogue-maker, could describe it as "presque unique." Wilson, the best-known English authority, does not attribute it to Rembrandt. *Sir's Bridge*, the first landscape sold, has the sort of interest attached to it which will always make it valued by lovers of curiosities. It was etched, as the often-told story says, while Rembrandt was one day waiting for his dinner, at the house of his friend and patron, the Burgomaster Six. If it is not a finished picture, it is valuable as showing how instantly Rembrandt could seize on the guiding lines, the leading lines, of a landscape, and with these suggest the whole. The impression sold to Mrs. Noseda for 10*l.* 15*s.* Colnaghi bought a fine second state of *The Sportsman*, landscape, for 30*l.*; and a very good impression of a late state—the fourth—of a *Village near the High-Road*, for 20*l.* A fair impression of *Rembrandt's Mill* sold for 19*l.*; a fine *Goldweaver's Field*, for 36*l.* The former is one of Rembrandt's most delicately finished compositions; the latter looks at first merely a sheet of jottings of many objects in a wide and varied landscape. It has yet qualities of abstraction and selection, which come to be valued chiefly when it is well known. The *Canal Landscape of an Irregular Form* (Wilson, 218) is rarely offered for sale. Mrs. Noseda acquired this one for 27*l.*, and for 82*l.* the same buyer acquired a splendid impression of the great landscape known as *The Three Trees*—one of the most passionate and powerful of all the works of the master—certainly his greatest achievement in the field of landscape.

THE sale of the art collection and paintings of M. Gustave Fould took place on the 23rd and 24th ult., at the Salle Drouot, and realised 55,000 fr. (2,200*l.*):—Lot 1. A pair of seaux of Sèvres porcelain, soft paste, Louis XV. period, 2,900 fr.; (2.) Solitaire of Sèvres, also soft paste, and same period, 810 fr.; (27.) Bronze group, *Nessus and Deianira*, Louis XIV. period, 2,060 fr.; (28.) Time-piece, the Three Graces supporting the movement, Louis XIV. period, 1,800 fr.; (58.) Incense burner of Chinese cloisonné enamel, 1,000 fr.; and (59.) A circular bowl of the same ware, 930 fr.; (64.) Commode of Boulle, Louis XIV. period, 1,550 fr.; (65.) Bureau of wood marquetry, Louis XV. period, 1,360 fr.; (73.) Large copper bowl, Italian, Louis XIII. period, 1,120 fr.; (75 and 76.) Two tapestries, hunting subjects, Henry IV. period, 2,300 fr.; (77.) Tapestry with silver thread, Louis XIV. on horseback, 961 fr. The paintings sold as follows:—(8.) Jan Ten, *Port of Amsterdam*, 1,105 fr.; (10.) Gonzales Coques, *A Musical Party*, 1,080 fr.; (12.) Demarne, *Return from Fishing*, 915 fr.; (13.) Desportes, *Dog watching Game*, 890 fr.; (14.) Diepenbeeke, *Holy Family*, 1,020 fr.; (17.) Van Goyen, *Entrance of Wood*, 1,500 fr.; (20.) Hubert Robert, *Interior of an Italian Dwelling*, 1,105 fr.; (29.) Mallet, *Evening at Mdme. Tallien's*, 785 fr.; (43.) Van der Velde, Sea-piece, 1,200 fr.

In one of the sales of last week two fine mahogany armchairs, with ormoulu mountings, period Louis XVI., sold for 6,900 fr., and four Flemish tapestries for 4,850 fr.

THE Belgian pictures and other works of art were sold by auction in the Gallery of the International Exhibition on the 24th, 26th, and 28th ultimo. The pictures sold well, many at higher prices than those at which they were fixed. The sale realised 13,125*l.* 4*s.* 6*d.*

NOTES AND NEWS.

MR. ARMSTRONG is at this moment engaged in completing an important series of decorative paintings on which he has been for some time at work. They are executed for a dining-room built by the architect, Mr. Nesfield, at Bank Hall, Chapel-en-le-Frith. The room is about eighteen feet square, and is lighted by a large bay win-

dow, on either side of which are blank wall spaces; one side of the room next to it is entirely free, the other side has in its centre the fireplace, at the opposite end are two doors. The fittings are fashioned throughout in unstained, unpolished oak, and in this material the frames ultimately destined to receive the panels painted by Mr. Armstrong are executed. These panels are ten in number. The principal composition occupies the unbroken wall space opposite to the fireplace: it consists of three portions—a centre group on a panel about seven feet long, supported right and left by subordinate figures. The panels either side of the window contain groups of birds; those which fill the spaces on either side of the fireplace (at present only sketched in) will contain figures; and in the smaller panels above the two doors birds again furnish the subject. Mr. Armstrong has very skilfully contrived to give an air of continuity to the various groups of figures and birds which succeed each other in the panels on the same level, by employing a background which admitted of something like repetition without the risk of sameness. A marble wall with alabaster panels runs through all. In the three principal compartments we see the fruit and foliage of an orange grove rising above its edge, the centre of the middle one is occupied by a fountain, a girl kneels beside its basin, she dips her hand in the water, at her side is placed a bowl of gold fish, another girl stands and bares her arms, leisurely preparing to follow the action of her kneeling companion. They are transferring the gold fish from the bowl in which they are confined to the fresher waters of the fountain. The marble wall rises directly behind. On the edge a boy stretches himself, and watches their proceedings. In the right-hand compartment sits a girl embroidering, and above the wall we see the line of a second wall where the orange grove breaks, and then a fine outline of distant mountains against the sky. The leaves of the trees are brushed by the wings of two pigeons rising in hasty flight. A large red tiger-lily grows in front of the figure, and these flowers reappear in the left-hand compartment, which is filled with a girl feeding pigeons—one of the happiest of Mr. Armstrong's creations. The pose is expressive of an ease, simplicity, and grace which give the figure great charm. To this succeeds the panel on the right of the window. Here an oleander branches out of a red terracotta pot against the marble wall, over which comes a broad sweep of clear sky. To the left of the pot stands a stately stork, whose attention is challenged by a magpie, who makes a lively dart from the opposite side. The panel on the left of the window contains a group of swans pluming themselves on steps crowned by a border of brilliant marigolds, out of which the marble wall again appears; whilst over head, trained against the upper wall, blossoms a white magnolia. The ground everywhere, except in this picture, is green; not very green, for that would disturb the warm harmony of colour required by the tone of light oak in which the room is fitted, so the grass is covered with daisies. No positive blue occurs anywhere; the sky is delicately pale, with streaks only of grey blue in a warm air, and for the rest shades of yellow, of warm brown, of orange, or dark red. A group of wild ducks falling through the sky in rapidly descending flight fill one of the spaces above the doors; the other is occupied by a majestic peacock seated in the branches of a cedar tree. These birds—the stork and magpie, the swans, the swarm of feeding pigeons—have all been painted by Mr. Randolph Caldecott, on the spaces and lines indicated in Mr. Armstrong's design. Their execution is in every respect admirable; in flight or in motion they are equally full of grace and life. A word should be said as to the method of technical procedure, which promises special advantages of steady durability. All the work has been done on canvasses prepared in the ordinary manner,

and over that two coats of flake white, to which plenty of time for hard drying has been allowed. No flake white (white lead) however has been employed in the painting, which has been carried through in zinc white only, which will (as far as present experience shows) remain light without the protection of varnish, or much oil. The linseed oil in which the permanent pigments used with this white are ground, is the sole medium employed. The surface thus obtained is very dead, and greatly resembles the appearance of fresco. It will not require varnish, and can actually be washed without taking any harm. These paintings are now to be sent down to Bank Hall, and will be fixed in the places which they are destined finally to occupy. Mr. Armstrong will then complete them on the spot. It is hoped that some arrangement may be contrived which will admit of the pictures being put up temporarily, so that after their final completion they may be removed for exhibition in town next spring. In this case we shall hope to return to the subject, and to devote a special notice to this important series of compositions—important not only on account of the pure decorative sentiment which inspires them throughout, but on account of the delicately conscientious zeal which it is evident that the artist has unselfishly brought to the service of his motive.

AMONG much official work at present to be seen in Mr. Armistead's studio, there is one bas-relief, the subject of which is independent, and which deserves special attention. The dead body of a man of middle age stretches right across the slab; the head is supported by an angel, at the feet springs an eagle. The theme is most poetically suggestive, and the treatment has the freshness, delicacy, and *naïveté* of genuine work.

AT a meeting of the Executive Committee of the St. Paul's Completion Fund, held yesterday week at the Chapter House, the following resolution was carried by a majority of nine to four:—

"The Committee agree to comply with the recommendation of the Dean and Chapter of St. Paul's, that steps should be taken for rescinding the agreement with Messrs. Burges and Penrose, which has been found to be highly inconvenient in its working."

THE entire absence of critical work would render the recently issued Catalogue of Mr. Whistler's Etchings of no interest to any but the possessors of the etchings, even if the price at which alone the book is to be obtained did not place it beyond the reach of the greater part of such public as cares for art in England; but the catalogue, giving little but the names and the briefest possible description of the etchings, will yet be of some use to those who are collectors of Mr. Whistler's prints. The publication of so bare though painstaking a record does not afford a very fitting opportunity to say much about the prints themselves, and it would be difficult to say much about the catalogue. Mr. Ralph Thomas, the compiler, has recognised eighty-six different etchings. Of some of these only one or two impressions are believed to exist. Not half of the whole have at any time been regularly published. One small set was published in France, and another, later on, in London. The rest have filtered from time to time into different private collections.

A PAPER just published by Marquis Campori in the *Nuova Antologia* at Florence, gives new and valuable information as to the relations of Titian with the Dukes of Ferrara. The Marquis is known as the author of several interesting contributions to the literature of art; and he has more than once succeeded in finding among the records of the house of Este documents of the utmost importance. In the present instance he gives us two original letters of Titian, and a *précis* of correspondence between Alphonzo I. and his agents at Venice and Bologna—in which the name of Titian frequently occurs. From these we gather that an intimate connexion existed between Titian and the Ferrarese court from 1516 to 1534, and that though Alphonzo was not as urbane or friendly

with the great painter as the Marquis of Mantua, he gave him valuable commissions. It is apparent, indeed, that Titian painted more pictures for Alphonzo than for any of the Italian princes; and his services at Ferrara are only surpassed by those he did to Charles V. and Philip II. Once, and once only, Alphonzo tried to attach Titian to his person by offering to take him to Rome at the accession of Adrian VI. in 1522. But Titian neglected the offer. At a later period the enmity between Clement VII. and Ferrara made the Marquis of Mantua a more useful friend to the painter than one who could not favour Titian's applications for church preferment for his son.

In 1514 Giovanni Bellini had left a Bacchanal unfinished at Ferrara which was composed for a drawing-room in the Duke's palace. It was his custom to complete pictures of this kind up to a certain point only, leaving the finishing touches to be given on the spot, and when he returned to Venice from Ferrara at the close of 1514, it was probably his intention to return to give the finishing strokes to the Bacchanal. In this, however, he was prevented by age, and it became necessary for the Duke to look out for another master who should not only complete what Bellini had left undone, but add two or three more compositions to those which already adorned the drawing-room. Marquis Campori, in one of his earlier contributions to periodical literature, has told us how Alphonzo employed Pellegrino da Udine and negotiated (ineffectually) with Raphael. Titian was more pliant than the latter, and more able than the former; and in the course of seven years (1516-23) he completed the series of four Bacchanals, of which the first, now at Alnwick, was nearly finished by Bellini.

Titian pursued the same system as Bellini: he took his pictures to Ferrara to give them the final touches, and in this way his visits to the "castello" of the Duke were very numerous. We ascertain that he worked (probably at Bellini's Bacchanal) in February and March, 1516; that he delivered the Dance of Cupids round a Statue of Venus (Madrid) after that date, the Bacchanal (Madrid) in 1519, and the Bacchus and Ariadne of the National Gallery at the end of 1522. The subsequent dispersal of these treasures, and the loss to Ferrara of all Titian's works, is too well known to need further illustration here.

WE are sorry to have to record the death, at Munich, at the age of seventy-five, of the well-known Bavarian genre and animal painter, Karl Hess. His pictures were especially remarkable for the fidelity with which he reproduced the characteristic features of alpine and forest scenery, and the special individualities of animal life.

RECENT reports from Madrid announce that the severed parts of Murillo's painting of St. Anthony of Padua have been discovered, but unfortunately in an injured condition, the head of the Saint having been detached from the remainder of the body, and the picture having been thus even more seriously damaged than was expected. Till this discovery was made, a hope was entertained that the known value of this beautiful work would have secured it from such desecration at the hands of those who were presumed to have perpetrated the theft from a thorough appreciation of the intrinsic value of the painting itself. The latest reports announce that two Englishmen have been denounced by their Spanish confederates as the instigators of the act.

THE Cercle de l'Union Artistique has just opened, in its rooms in the Place Vendôme, an exhibition of the works of M. Carolus Duran, the rising portrait painter: a brother-in-law of Mlle. Croizette, of the Théâtre Français, whose portrait he has exhibited at the Salon. Carolus Duran's works include both portraits and landscape studies, finished pictures and sketches. Those now exhibited to the members of the Club and their friends number forty in all, of which one only has

been shown before—the little girl's portrait which was in the Salon last season.

THE *Chronique* published last week an interesting contribution to the history of costume, in the form of a catalogue of a sale by auction of a nobleman's personal effects that took place in the year 1572. It affords a curious illustration of the manners of that period to find that such illustrious personages as the Queen-mother of France, the King's brother, afterwards Henri III., the Cardinal de Bourbon, the Scotch Ambassador, the Duc d'Aumale, the Duchesse de Lorraine, and many others of high rank, disputed with one another, and also with a less aristocratic company of citizens, for the possession of what Hebrew salesmen would term "old clo'." Such a sale would at the present day be chiefly attended by that fraternity, but in the sixteenth century, when dress had a deeper significance than the mutability of fashion now permits, it was not evidently considered beneath the dignity of the greatest nobles in the kingdom to add to their wardrobe from the left-off apparel of a deceased member of their order. Thus we find the President d'Orsay, a great dignitary of the law, buying "a pair of breeches of black silk, enriched with embroidery in silver, and lined with white linen;" "two pair of slippers, one pair of red-brown velvet, and the other pair of morocco; and two pair of boots, one pair of black velvet, and the other of white morocco; a mantle, and several other articles." The Duc d'Aumale purchased a magnificent mantle, which is described as being of "cloth of silver with bands round it, and enriched with great cords, the order of St. Michael in gold, and with crescents throwing forth flames of fire, lined with white satin," &c. This grand mantle had been kept by its owner in a "box of fir wood with two locks, and both box and mantle were delivered to the Duke for the sum of 700 livres." The Queen-mother, Catherine de Medici, chiefly purchased linen, and in the inventory of her effects, recently published by M. E. Bonaffé, some of the tablecloths, serviettes, &c., that she bought, turn up again. Tablecloths had then only recently been introduced in France, and were only used by the nobility.

THE Exhibition of the "Cercle Artistique et Littéraire," of Brussels, is now open, and contains, we hear, some excellent works. The Society of the "Amis des Arts de Lyon" will open its annual exhibition on January 8, 1875; and the "Amis des Arts de Pau" on January 12.

UNDER the title of "La Peinture à Genève" the *Journal Officiel* publishes an interesting article by Emile Bergerat on modern Swiss painters, many of whom have lately figured in the Salon. A young artist named Simon Durand, who chooses his subjects chiefly from Swiss life and history, is favourably spoken of. His style is said to be "a compromise or neutrality between the German and the French schools." Hitherto Calame has been the only Swiss painter who has achieved anything like a wide celebrity.

THE city of Lyon has lately been enriched by the generosity of a M. Jacques Bernard, formerly mayor of Guillotière, who has presented to it his important collection of pictures. The collection is so large, consisting of 400 paintings, that the municipal council have devoted to its reception the sculpture gallery of the Palais Saint-Pierre, and have decided that the casts now exhibited in that gallery shall be removed to the Salle de Bourse in the old Abbey.

THE well-known Dr. Wilhelm Schmidt, one of the editors of the *Allgemeine Künstlerlexicon*, and a constant writer upon Art, has been appointed Conservator of the Royal collection of prints and drawings at Munich.

DR. MAX JORDAN has entered upon his duties as Director of the National Gallery at Berlin.

THE *Débats* states that M. le Baron Ch. Davillier, who will write a biography of the late M. Fortuny, has in his possession a large collection of letters of the deceased painter, which are all full of pen-and-ink sketches, and also of his engravings and lithographs. M. Berger, who contributes an appreciative notice of the great Spanish artist, expresses disapproval of the proposition already mooted to hold an exhibition of M. Fortuny's works in London.

THE ninth volume of M. Alfred Michiel's *History of Flemish Painting*, so long delayed by the war and its consequences, has just been published by Messrs. Lacroix. The work is to be completed in ten volumes.

THE Städel Institute at Frankfort-on-the-Maine has acquired during the past year several valuable paintings by old masters. One of these is attributed by Dr. W. Schmidt, who has written an article on the subject in the *Augsburger Allgemeine Zeitung*, to no less a master than Jan Van Eyck. It is certainly signed "Memling," but its free mode of handling does not belong to that painter, who is distinguished for his miniature-like style. The picture represents St. Jerome with his lion, in a landscape, kneeling before a crucifix. It is spoken of as being a real jewel. If not by Van Eyck, it is considered to be probably by Petrus Cristus or Christophsen, but if so it exceeds in its life-like modelling, clearness of tone and wonderful knowledge of perspective, every work previously known by that master. We must remember, however, that Wornum's dictum is, that unless a work be perfect in all respects it is not by Jan Van Eyck. This is a severe test perhaps, but not altogether a misleading one. Besides this reputed Van Eyck, the Städel Institute has gained an excellent example of Aert van der Neer, being one of that painter's rare daylight scenes; an historical painting in Rembrandt's style, which is claimed by W. Schmidt for Jan Steen; and an early Flemish Annunciation, which resembles the works attributed to Gerard David.

AMONG additions to the Museum of the Scottish Society of Antiquaries at Edinburgh, the *Scotsman* mentions a portion of an ancient canoe, discovered last summer in a small loch in Kirkcudbrightshire:—

"Hollowed out of a single oak trunk, the ancient vessel presented the unusual length of 45 feet. It was 5 feet wide at the stern, which was formed, as in old Scotch canoes generally, of a cross piece of wood let into a groove; and tapering away gradually towards the prow, terminated in a figure-head consisting of the rudely-carved head of a horse. From the character of its workmanship, the canoe is supposed to have belonged to a period in which metal tools were available. The presence of a figure-head is a specially noteworthy feature. Indeed this is said to be the only canoe with such an ornament yet discovered in Scotland. Other characteristics are two clean-cut holes in the bottom of the vessel, apparently for the escape of bilge water, and seven holes along each side near the gunwale, evidently intended to serve as rowlocks. The canoe may possibly have been used by the inhabitants of a crannog, which is clearly traceable in the loch where it was found.

"Another interesting addition just made to the museum is a piece of antique stone carving, evidently the arched head of a gateway, and which is supposed to have formed part of the entrance to the palace of the Pictish kings at Forteviot. This curious piece of sculpture was found some thirty years ago in the river May, which is believed to have encroached upon the ground occupied by the ancient palace, and if the theory of its origin is correct, must date from the tenth or eleventh century. In the centre of the arch is the figure of a cross, and this is flanked on either side by figures in bas relief, including one with a sword resting on the knees, which may possibly represent a royal personage."

A NEW museum is in contemplation at Rouen to replace the old galleries in the Hôtel de Ville, which are now insufficient to hold the collections.

THE STAGE.

THE production of another opera of Lecocq's was the theatrical event of last Saturday. It is the *Prés Saint Gervais*; it was played at the Criterion Theatre; and in the present temper of the public, its success is hardly a thing which we need trouble ourselves to chronicle at length. Popular success was assured for it. It had been secured a fortnight before, in Paris—not indeed such a popular success as maintains *Madame Angot* always before the town, for *Madame Angot* has been to Lecocq what *Guy Livingstone* has been for Mr. Lawrance, and the *Death of Chatterton* to Mr. Wallis. This is not the kind of success to be easily repeated; but a fair enough success the *Prés Saint Gervais* did obtain. Its story—told already in the daily papers—is not one of those that are worth repeating. M. Sardou in stretching the tale beyond its original bounds, has not improved it. He has given the composer additional opportunities, however, and M. Lecocq has known how to use them. The *Prés Saint Gervais*, if it is to be criticised minutely, must be criticised as music: not as play. For here Lecocq is further than ever from Offenbach: nearer than ever to Auber. The engagement of Miss Pauline Rita, to sing some of the best of the music, was therefore a wise one. As a singer she accomplishes much: as an actress she promises something. Miss Florence Hunter, Miss L. Adair, Miss C. Lewis, Miss Emily Thorne, Mr. Brenner, Mr. Perrini, and others, were included in a cast which on the whole must be pronounced competent, though not brilliant. Mr. Stanislaus conducted, and deserves praise for his work, and the resulting smoothness of the interpretation. The first performance took place on the evening of the day on which a great power in London had attacked the institution of opéra-bouffe; but to be at pains to chronicle that there was nothing in this particular performance at the Criterion which could be open to the just strictures of the *Times*, is to mention a fact which, as things now go, is not likely to add to the popularity of the entertainment.

THE above-mentioned attack on opéra-bouffe appeared in the form of an article headed "License of the Modern Stage," and there were two counts to the indictment—the first charging opéra-bouffe with triviality, the second with licence. The triviality, which is undeniable, would be all very well in its time and place, but its time should be after a comedy—say from ten to eleven—and its place, two or three theatres, and not a dozen. The licence is a matter which we think is more open to question, for, cancan apart (and Mr. Pigott is looking after that)—cancan apart, we say, nothing vulgar can be done in opéra-bouffe which could not also be done in comedy or farce. We have lately seen comedy acted farcically, and farce acted vulgarly. Even farce is conceivable in which the women may be clothed in sea-weed and a shell. The one advantage which opéra-bouffe offers to planned and deliberate vulgarity consists in its emptiness. In comedy, there is the story and the wit of the dialogue: in farce, as it now is, the conventional but still accepted humour and practical jokes of the situation. These give their *raison d'être* to comedy and farce; and of course the devotees of opéra-bouffe tell us that it too has a *raison d'être*—music. But you have music at the Monday Popular or at Covent Garden: unadulterated music at both: music of the highest schools at the one and sometimes of the brightest at the other: at one, the music of culture and science; at the other, the music for pure recreation. It is not really the music that has made opéra-bouffe so popular an entertainment, while even light opera has no acknowledged home. It is the faces, the figures, the raiment, and the absence of raiment. It is the habit of dining very late and very well. It is more than all, we venture to say, the national indifference to art for the sake of art, and this last has allowed opéra-bouffe to conquer easily a place in

England which it has not even attempted to assail in France. The best theatres of Paris are entirely safe from the chance of its invasion—in Paris, mark it, not only those that are subsidised—but there is hardly a theatre in London at which the announcement of its advent would nowadays be a surprise. The *Times*, then, is amply justified in its complaint; its article no doubt expresses—as it claims to express—the feeling of the best class of the playgoing public; but it offers no remedy, and suggests no solution. Nor, perhaps, is it possible to offer a solution at the moment. The puritanical feeling which refuses to recognise the art of the theatre as a legitimate art, of immense possibilities, is still widely diffused, though daily becoming less so. It must further subside before any proposal to place, through State aid and recognition, the best theatres beyond the chance of deterioration, can be deemed a practical one. But that is the proposal which will some day have to come.

WE were in error in a Stage Note last week. It is Mr. Leonard Boyne, and not Mr. Odell, who now has nightly the task of imitating Mr. Irving as Hamlet, in Poole's travesty, at the Globe. Mr. Belmore enjoys a like exercise, at the Princess's, every evening before the serious play of Mr. Watts Phillips.

MISS HELEN FAUCIT will be fairly supported next Saturday, in her performance of Beatrice. The cast is not before us, but Mr. Creswick is included in it, and Mr. Righton is to play Verges, and Miss Walton—the young American actress who is already liked at the Haymarket—is to play Hero.

CHILDREN, great and small, will like to know what pantomimes are preparing for them. At Drury Lane there will be *Aladdin*; at the Princess's, *Beauty and the Beast*; at Covent Garden, *The Babes in the Wood*; at the Surrey, *The Forty Thieves*; and at the Standard, *Robinson Crusoe*.

Two well-known comedians return immediately to London—Miss Amy Fawcitt and Miss Ada Cavendish. The latter appears at Christmas at the little Charing Cross Theatre, in her favourite character in *The New Magdalen*. The former has not been seen in London since her withdrawal from the Vaudeville, in the early summer.

MONSIEUR JULES BONNASSIES—known for his learned little works on the past of the French stage—is to be the editor of the high-class fortnightly magazine, *Le Théâtre*, which, according to the prospectus, will include among its contributors, Messrs. Théodore de Banville, François Coppée, Eugène Despois, Paul Ferrier, Ernest Legouvé, Frederick Lock, Professor Molbeck, Charles Monselet, Léon Riquier, Sapin, Francisque Sarcey, Louis Ulbach, Frederick Wedmore, and Venceslas Szymanowski.

MEILHAC and Halévy have had an incontestable success, at the Palais Royal, with their *Boule*. The piece is founded on an incident of domestic life which is trivial, if not vulgar: a quarrel between a man and his wife about nothing of any importance. But it goes on painting what is the funny side to the spectator, and all the irritation to the actor, in these *petites misères*. What Balzac first observed in the relations of his Caroline and her husband (*Etudes Analytiques*), Meilhac and Halévy have here narrated or exhibited with a gaiety to which the novelist was a stranger. The two at last desire to separate, and each consults a lawyer. "What are your grievances?" asks the lawyer. "There are a thousand," says each party to the quarrel. But the lawyers must have facts, not words: give them facts and the separation can be obtained. Meanwhile each must behave to the other with supreme calmness and courtesy, so that it shall be "the other" who in the presence of a third person shall commit the insult or offence. The third person is a man who comes on

a mission which must needs be secret: it is therefore easy to imagine his horror when he is bidden to retain the words he has heard—for they do squabble after all—and to repeat them in a court of justice. So the fun goes, passing from well observed comedy of manners to farce as it proceeds, but never pretentious, never conventional—always true, personal, and individual. The little piece, though belonging to the class of literature that is designated as "light"—chiefly by those whose own literary work is necessarily heavy—is written with the utmost pains. The effect of each sharp thing is carefully calculated, and Meilhac and Halévy are supported by actors who have spared no trouble at rehearsals. Gil-Peres gives complete individuality to the unfortunate "third person" who is a witness against his will; Geoffroy is the husband; Mlle. Valérie, the wife; while Lassouche and Lheritier as a judge and a valet do not lag behind the rest in throwing conventionality aside, and in presenting the spectator with laughable studies of character, temperament, and manners, such as they are to be met with in the life of the hour, and not in traditional representations.

COQUELIN, one of the wittiest comedians at the Théâtre Français, has been performing with great success, at Bordeaux, his famous character in Scribe's *Une Chaine*.

Le Tour du Monde—the instructive spectacle, based on a travel-book of Jules Verne—is about to be given at Brussels. At the Porte Saint Martin it still draws crowded houses.

THERE was great disappointment in the theatrical world in Paris at the beginning of this week, owing to the postponement of M. Sardou's *La Haine* which was announced for performance at Offenbach's theatre—the Gaité—on Monday. The excellent actor Lafontaine, who has given up his rôle of Mazarin in *La Jeunesse de Louis-Quatorze* at the Odéon, to play in Sardou's new piece, was prevented by temporary illness from appearing.

At the Odéon, in spite of Lafontaine's absence, *La Jeunesse de Louis-Quatorze* continues to attract, but in the attractiveness of the performance the famous hounds count for almost as much as the actors. Gil-Naza now plays Mazarin, with something less than Lafontaine's art.

MUSIC.

CRYSTAL PALACE.—HANDEL'S "L'ALLEGRO."

WHETHER the idea of composing a large cantata on the text of Milton's two poems *L'Allegro* and *Il Penseroso* originated with Handel himself or with his friend and patron Charles Jennens, it is difficult to say. It is at all events known that it was the latter who compiled the libretto, and who had the audacity to add a third part, *Il Moderato*, of his own to the text of Milton. This third part may be briefly dismissed with the remark that it is of exceedingly "moderate" excellence—smooth verse containing little but platitudes, and to which not even Handel, little fastidious as he was in his selection of words, could write his best music. The composer himself seems soon to have become aware of this, as during his lifetime he frequently altogether suppressed the third part at performance—a precedent which was followed last Saturday with great advantage at Sydenham. With respect to the other two poems, passages from each are judiciously alternated, so as to give the necessary variety to the music. It is obvious that had the whole first part been devoted to *L'Allegro*, and the second to *Il Penseroso*, too great monotony, especially in the latter case, would have resulted. As it is, we find a kind of animated discussion as to the relative advantages and pleasures of mirth and melancholy.

Though so infrequently performed as to be almost unknown to the majority of our audiences, the score of *L'Allegro* contains some of Handel's

finest music. Curiously enough, the best known piece is one of the weakest numbers. This is the air with flute obbligato, "Sweet Bird," excellent as a mere show-piece both for singer and player, but (with all respect for Handel be it said!) the veriest trash from a purely musical point of view, and not to be compared with many of the other portions of the work. Some of the songs of *Il Penseroso* are among the old master's finest inspirations. Among these may be especially mentioned "Come, but keep thy wonted state," in which the "even step and musing gait," of the text are so admirably depicted by the stately progression of the bass in quavers. Even more charming is the song, "Hide me from day's garish eye," in the greater part of which Handel, anticipating a device of modern instrumentation, has suppressed the basses, and given the lowest part of the harmony to the violas alone. Both these airs, however, are of too refined a nature to gain a wide popularity. The cheerful songs of *L'Allegro*—such as "Come, thou goddess fair and free," "Mirth admit me of thy crew," or "Let the merry bells ring round"—are much more adapted to catch the general ear. Of choral writing the work contains comparatively little, though what there is is quite up to Handel's standard. The laughing chorus, "Haste thee, Nymph," is well-known and popular; but some of the other numbers, such as the finale of the first part, "And young and old come forth to play," or the choruses in the second part, "Populous cities please us then" and "These pleasures melancholy give," are, musically, perhaps even superior.

The performance last Saturday was, on the whole, a very good one. The solo parts were in the hands of Mme. Lemmens-Sherrington, Miss Emily Spiller, Mr. Edward Lloyd, and Mr. Whitney. It would be a breach of duty towards our readers not to protest strongly against Miss Spiller's singing of "Let me wander not unseen." In the first place, she had no business to sing it at all. The song was originally written for a tenor voice, and is almost always sung as a tenor song. We understand that Miss Spiller persuaded Mr. Lloyd to give it up to her, which that gentleman very politely did, but this proceeding was none the less objectionable on the part of Miss Spiller, as showing a want of respect for the composer's intentions. But this is not our only complaint. Having secured the song, the least the lady could have done would have been to give an artistic rendering of it, as Mr. Lloyd would undoubtedly have done. Instead of this, she entirely spoilt the close by a most arbitrary and tasteless alteration of the text. It is not at all pleasant to have to make such comments as these; but it would be failing in our duty toward art to suppress them and allow so gross an instance of "meddling and muddling" to go unnoticed. The other vocalists were excellent, and the chorus, with the exception of a slight slip in "There let the pealing organ blow," was admirable.

An important feature in the performance was the introduction of Robert Franz's additional accompaniments. No living musician has made such a specialty of additional accompaniments as Franz, and certainly no one has more thoroughly entered into the spirit of the old masters. Several volumes of his arrangements are published, among these being Bach's *Matthäus Passion*, *Magnificat*, and several Church Cantatas, as well as Handel's *L'Allegro* and *Jubilate*. No greater proof could be given of the fine feeling and tact with which Franz has approached his task than is shown by the difference of his additional accompaniments to Bach and Handel. Whereas the former are, in accordance with the character of the music, almost entirely polyphonic, those to Handel's works consist mostly of plain chords or sustained harmonies. The effect is invariably admirable, always clear, never overdone or obtrusive, but supplying exactly the amount of filling up required by Handel's sketchy and sometimes almost skeleton scores. It need scarcely be added that under

Mr. Manns's careful direction they were played to a wish.

To-day being the anniversary of Mozart's death, the programme will be chiefly selected from his works, and will include among other things a violin concerto to be played (for the first time in this country) by M. Sainton.

EBENEZER PROUT.

It is gratifying to find that the spirit and enterprise with which the Monday Popular Concerts are being conducted during the present season shows no falling off as compared with previous years. Of this no better proof could be afforded than was furnished by the programme of last Monday, when, in addition to Beethoven's Quartett, Op. 74, and Bach's "Chromatic Fantasia," two specimens of the "Modern German School" were presented—the one being Raff's Sonata in D, Op. 128, for piano and violin, and the other Rheinberger's Piano Quartett in E flat, Op. 38. As the latter work has been already noticed in detail in these columns (see ACADEMY for Aug. 8), it will be sufficient now to say a few words about the former. Joachim Raff (whose "Lenore" symphony, it will be remembered, was recently produced with such success at the Crystal Palace) is a composer, the great effect of whose music is largely to be attributed to its masterly workmanship. In what is termed "thematic development" he has few equals. The first movement of the sonata under notice is an example of this. Constructed on a not very striking subject, consisting merely of the notes of the common chord, it yet becomes exceedingly interesting from the skill with which the theme is treated. The second movement is less striking, at least on a first hearing; but the Andante is full of charm, and the Finale most bright and inspiring. The work was admirably played by Dr. Bülow and Herr Straus; the former, who made his last appearance at these concerts for the present, was in his best vein, and gave so fine a reading of Bach's Fantasia that a most vehement though fruitless effort was made by the audience to obtain an encore. The other performers were Messrs. Ries, Zerbini, and Piatti; the vocalist was Mdlle. Nita Gaetano, who replaced Mme. Otto-Alvsleben; the latter lady, who had been announced, being unfortunately too unwell to appear.

THE concerts at the Royal Albert Hall during the past week have been equal in interest to their predecessors. The most important novelty of the "English" night was a piano concerto by Mr. J. F. Barnett, played by his sister, Miss Emma Barnett, one of the most promising young pianists now before the public. Wednesday night was a "Beethoven" night, the music being selected from his second period, and comprising the C minor symphony, the overtures to *Egmont* and *Fidelio*, and the concerto in E flat, played by Dr. Bülow. The oratorio on Thursday was *Elijah*, and the usual "Wagner Night" was advertised for last evening.

At the second of Mr. Henry Holmes's "Musical Evenings" last Wednesday, which our reporter was unable to attend, the works announced for performance were Beethoven's quartett No. 10, Schumann's sonata in A minor for piano and violin, and Haydn's quartett, Op. 50, No. 3.

THE second meeting of the new "Musical Association" is to take place on Monday next, when Mr. Sedley Taylor will read a paper on "A Suggested Simplification of the Established Pitch-Notation."

HERR JOACHIM is announced as conductor of the next Lower Rhenish Music Festival, which is to take place at Düsseldorf next Whitsuntide.

ANTON RUBINSTEIN has completed a new symphony (No. 4) in D minor, a new piano concerto (No. 5) in E flat, and a new violoncello concerto (No. 2) in D minor, all of which works are shortly to be published by Bartholf Senff, of Leipzig.

POSTSCRIPT.

A PAMPHLET on Mr. Henry Irving's performance of Hamlet at the Lyceum Theatre is about to be published by Messrs. Henry S. King & Co. The author is Mr. Edward R. Russell, now editor of the *Liverpool Daily Post*, and formerly dramatic critic of the *Morning Star*.

THE third part of the Palaeographical Society's publications, now being distributed to subscribers, comprises thirteen facsimiles, among which are specimens selected from the Paris MSS. of Prudentius and Livy of the sixth century, from the "Augustine Gospels," with contemporary illustrative drawings, in the Library of Corpus Christi College, Cambridge, of the seventh century; from the illustrated Terence of the Bibliothèque Nationale, of the tenth century, as well as a second plate from the Latin papyrus of Ravenna, A.D. 572; and facsimiles of two dated Greek MSS. of the tenth century. The Committee of Management proposes to extend the action of the Society to Oriental Palaeography, a branch which has hitherto been excluded; but in order to prevent interruption of the progress of the work already in hand, a separate subscription list will be opened. The editing of this extra series of Oriental Palaeography will be undertaken by Dr. W. Wright, Professor of Arabic in the University of Cambridge.

M. F. REISSET, Director of the National Museums of France, writes to the *Times* of Dec. 3 to contradict the statements of Mr. Hodgson which we reprinted from the same journal (Oct. 30), to the effect that Veronese's famous picture of the *Marriage of Cana*, in the Louvre, had been ruined by the restorer:—

"Le tableau des Noces de Cana a été retouché il y a 20 ans. Comme ce n'est pas moi qui ai dirigé l'opération dont il s'agit, je puis dire qu'elle a parfaitement réussi. Depuis cette époque on n'y a pas touché."

"Ce chef-d'œuvre est, je l'affirme, dans un état surprenant de conservation, et je peux citer à l'appui de mon dire une preuve qui me semble décisive. Après avoir séjourné pendant un an à Brest, roulé dans son énorme caisse, il a été rapporté à Paris, retendu et remis à sa place, sans qu'on ait été obligé d'y passer même une goutte de vernis."

SATURDAY, DECEMBER 12, 1874.

No. 136, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

A Lost Chapter in the History of Mary Queen of Scots recovered. By John Stuart, LL.D., Secretary of the Society of Antiquaries of Scotland. (Edinburgh: Edmonston & Douglas, 1874.)

IN this work Dr. Stuart gives an able dissertation on the events connected with the Dispensation for the marriage of James Earl of Bothwell with the Lady Jane Gordon. The original, which has been missing for three centuries, was discovered by him about four years ago in the charter-room at Dunrobin, during his researches there for the Historical Manuscripts Commission. The Dispensation, of which a facsimile is given, is dated February 17, 1566, and was granted by James Hamilton, Archbishop of St. Andrews and legate a latere from the Holy See, and gives permission to the Earl and Lady Jane to marry, notwithstanding certain impediments of consanguinity, which in their case are alleged to be of the fourth degree in both lines. The presence of this document among the muniments at Dunrobin is accounted for by the subsequent marriage of Lady Jane Gordon, in 1573, with Alexander Sinclair Earl of Sutherland, who had also been divorced from a former partner a few months previously. A copy of the marriage contract is also given in the Appendix, in which the Earl of Bothwell endows Lady Jane with certain lands and hereditaments; it is dated on February 9, and is subscribed by Mary, the Earl of Huntley, and several others of the nobility. The marriage was solemnised on February 22, in the Church, of the Canongate at Edinburgh, and, contrary to the expressed desire of the Queen, in accordance with the rites of the Reformed religion. In little more than a year after this, Bothwell became the husband of the Queen, the ill-omened marriage ceremony being publicly performed on May 15, 1567, at Holyrood, according to the Reformed rite, and afterwards, on the same day, privately, according to that of Rome.

As in order to carry out his union it was necessary that his previous marriage should be annulled, Bothwell resorted to two distinct lines of procedure. In the one an action for divorce was brought by the Lady Jane Gordon before the Protestant Commissioners of Edinburgh on the ground of her husband's adultery, and proof having been furnished, sentence was pronounced in her favour on May 3. In the other a suit was instituted before the recently restored Court of the Archbishop of St. Andrews, at the instance of the Earl of Bothwell, for a decla-

ration of nullity of his marriage with Lady Jane, on the ground of their relationship within the prohibited degrees and the absence of any dispensation; and notwithstanding the fact that a form of dispensation had been granted little more than a year previously by the same prelate, sentence was given on May 7 that the marriage was radically null and void. As among the witnesses produced in this latter suit was the Bishop of Galloway, who, beside being Lady Jane's uncle, had also performed the marriage ceremony with Bothwell, the total silence as to the existence of the dispensation is not a little extraordinary; but that it either was not produced or its validity denied, is evident from the sentence. Dr. Stuart considers that the document was all the time in the possession of the Lady Jane, and gives several good reasons why she should have connived at its suppression which, though they bear undoubted testimony to her prudence and "cannyness," scarcely reflect equal credit on the morality of that lady, as in return for certain very substantial advantages to herself and her brother's family, she deliberately allowed her sovereign to be entrapped into a marriage which she knew to be invalid. The really important point, however, to be considered, is the question whether Queen Mary knew of the existence of this dispensation at the time of her consenting to the marriage with Bothwell, and here Dr. Stuart comes to an opposite conclusion to that arrived at by Mr. Hosack. He considers that the dispensation was, to some extent, a public document, which would most likely have to be produced at some stage of the marriage, and that this being the case, it was very improbable that the Queen would be ignorant of its existence, as she took such a special and personal interest in the matter.

It may, however, well be advanced on the other side, that the relationship between the Earl and his wife was tolerably remote, and that the marriage contract which was subscribed by Mary was anterior in date, and contains no allusion either to the relationship or the important dispensation among its provisions. Moreover, the manner in which it was ignored at the time of the suit for the divorce, and the ease with which it was suppressed by Lady Jane, would tend rather to prove that the dispensation was altogether of a private character; in fact, there is nothing to show that it was not privately procured from Archbishop Hamilton either by Huntley or his sister, as a very reasonable measure of precaution against any future difficulty that might arise with her husband; anyhow, we know that they were both handsomely paid for suppressing it, which, if it had been publicly known to exist, would scarcely have been in their power.

That Mary considered the marriage with Bothwell a matter of state necessity, urged on as she was by the voice of her nobility and the interested clique of traitors who surrounded her, is likely enough; but that she would have consented to a marriage which she knew at the time was not only absolutely void, but could not by any possibility be rendered valid, is scarcely within the verge of credibility.

Dr. Stuart gives an interesting account of the after-life of the Lady Jane Gordon, by

which it appears that she died at an advanced age an earnest professor of the Roman Catholic faith; and also that the existence of the dispensation did not appear to her to be a barrier of sufficient importance to prevent her from contracting a marriage in 1573 with the Earl of Sutherland, notwithstanding that her former husband Bothwell was still alive.

ALLAN J. CROSBY.

Diary of H. M. the Shah of Persia. A verbatim Translation by J. W. Redhouse, Member of the Royal Asiatic Society, &c., &c. (London: John Murray, 1874.)

DURING the Shah's visit to England he certainly moved the great heart of the nation in a variety of ways. The intelligent public stared at him with unusual zeal and assiduity, amateur philologists made a pother about his title, humourists were also exercised to discover puns on the same theme, financiers tried to get at him, and he resided here long enough to make most people tired of him and of his jewels, and ready to say, with Sir Lancelot, "diamond me no diamonds." Of course, among other wonders, society wondered what the impassive Oriental thought of it all. Was he profoundly meditating a new constitution for Persia—was he tempted to yield to the blandishments of tract societies—was he a skilled voluptuary in search of new sensations—or did everything he beheld drift past him, "a mere blur of sensation," as the philosophers say? When the Correspondent of the ACADEMY sent extracts from the royal *Diary*, and picked the plums out of that very plain and artless pudding, it became clear that his Majesty had regarded all things with the serene universality of his country's pantheism. The Shah's way of viewing Feringistan reminds one a good deal of Mr. Walt Whitman's comprehensive glance over the universe. Admirers of Mr. Whitman are aware that sympathetic critics have compared his muse to that which touches the Persian lyre. Nothing is too small, no place too shady, for her to record in unmelodious lays, and it is just the same with the Shah's *Diary*. Profoundly impressed, no doubt, with the universalism of his kingdom's bards, he gives as much space to inventions as to luncheons, and lays no more stress on religions than on the game of bowls. On the whole, if he has a speciality, it is his fondness for wild beasts, bath rooms, and jugglers, all of which, one might think, he could have in perfection at home.

It would be natural to look in his Majesty's *Reisebilder* for some touches of unconscious satire, such as the amiable Chinese of the last century was wont to aim against the manners of Europe. But unless entire acquiescence be a form of satire, there is nothing of the sort in the *Diary*. The Shah is devout, he thanks Heaven with unaffected piety, when he is not cold; and when mayors bore him with addresses, he shows a little temper. Beyond these qualities, and a complaisant readiness to be pleased, it is impossible to gather that he has any character at all. It is whispered that the public of Teheran do not think very highly of their master's compositions, and by no means rush

on them with the avidity we English display when the monarch favours us with some leaves from her Journal. We may guess that the Shah does not express all he thought, and may pick up what small items of interest his book affords, grain by tiny grain, as Amina ate her rice.

The Shah has an eye for nature in his way, and keeps a note of the flowers and trees on his route. "Yellow and red roses were to be seen" when he started, and "red roses were now come into bloom" when he reached Wiesbaden. There is something of prettiness in these floral dates. The floating ice on the Neva struck his fancy: "Every day many pieces of ice like mountains are brought down by it from the north, which are extremely pure and beautiful, like the ice in the ravines of the Alburz mountains." At Berlin, as indeed everywhere, he was fascinated by the Zoological Gardens: "I was extremely tempted to stay and observe the lions a long while; but, through the thronging of the crowds of spectators, this was impossible." The unlucky monarch was himself the lion, but in this case the first lion did "not think the next a bore." As to art, the Shah shows the germ of better things: "One standing figure of a woman was most graceful, so that one would have admired it seated before it for three whole days." As a rule, his powers of description stop at the point of calling everything indescribable; and he observes, with some pathos, that he was only allowed to look at this or that—a geological collection, Krupp's Gun Factory, Mdme. Tussaud's, the British fleet, and the Constitution at work in Westminster, for a very short space of time. So it is scarcely strange that he still believes in the Noachian deluge, and is very vague about Lord Gladstone, and the Tories.

There are some little plums in the Shah's account of England still left to be picked out. For instance, what a perfect name Lord Choseby is for a peer, as a translation of Lord Thingamy into broken French! This representative of the Royal caste has the last word with Mazzini:—

"In addition to the effigies of sovereigns and great men, they (Madame Tussaud's people) have also taken, in a very striking manner, the likenesses of certain individuals, assassins or reprobates, notorious through the world for their diabolic acts and wickedness, such as Orsini—who attempted to kill the third Napoleon, and Mazzini, an Italian."

Is Mazzini then, in the chamber of horrors? The police should see to this. Everyone has heard of the Shah's joke about the donkey, perhaps the very first-born child of his Asiatic humour. But everyone may not be aware that in London "the citizens set great estimation on the police; whoever behaves disrespectfully to the police is adjudged worthy of death." Persons who have a natural and even laudable anxiety to know as much as possible about dukes will bail the tidings that the Duke of Sutherland takes off his coat when he plays American bowls. Had the Shah told the world more facts of this importance, his volume would be greedily devoured by the circulating libraries. But the idea of a duke in shirt-sleeves brings out the broad facts of our common humanity, and it is sweet to think

of Iran's dusky son, our fellow Aryan, whose ancestors dwelt with our own fathers on the central plains, &c. &c., and worshipped the same broad blue vault, &c. &c.—it is sweet to think that he has not crossed seas and waters in vain, but has a message and a mission to the English snob.

Leaving our beloved country, which the Shah justly pronounces the most wonderful in the world, we find His Majesty rather fatigued in Paris. But his kingly intellect grasped the main facts of French politics with rare mastery:—

"Some are for a Red Republic, which is a fundamental common-weal. Others are for a moderate republic, in which monarchical institutions shall be found, without a monarchy existing. Others, again, wish otherwise. Among all these diversities of opinion it is now a very difficult matter to govern."

Any one who has examined young ladies' papers in history will recognise, in these remarks, the affinities of the Oriental and the female mind when engaged in political speculation. And surely the Shah has a meaning beyond what his words convey, when he says that the sword which Napoleon wore at Austerlitz is rusted to the sheath, so that no man may draw it. What Arthur, one wonders, is to achieve the adventure of this blade, and to throw away the scabbard?

The Shah did not see Mabilie, which he seems to regret, but he shot driven deer in Austria, and he notes that the King of Italy understands the institution of marriage in the same way as himself. In Vienna what pleased him most was the ballet, and on this theme he waxes really eloquent. About the Greek Islands he observes, that of one of them Fénelon wrote, and he mentions that the Sultan's windows in Constantinople do not come down with a run, and that hot and cold water is laid on in the palace. He never gets over his wonder at this luxury, nor his horror of "holes," his word for tunnels. He was very unwell at sea, before landing at home in Enzeli. This is nearly all the Shah has to tell Përingistan about his travels. We may conclude with him—"All being over, praise be to God for all things;" and Heaven preserve us from any more literary Shahs! A. LANG.

Deep-Sea Fishing and Fishing Boats; an Account of the Practical Working of the various Fisheries around the British Isles, with Illustrations and Descriptions of the Boats, Nets, and other Gear in Use. By Edmund W. H. Holdsworth, F.L.S., F.Z.S., &c., late Secretary to the Royal Sea Fisheries Commission. (London: Edward Stanford, 1874.)

Of the industries engaged in by the inhabitants of the British Isles and more than one of our colonies, not the least important is the capture of sea-fish. The facilities and inducements to carry on this branch of industry go hand in hand; and owing to the extent of sea-board at command, as well as the abundance, variety, and quality of the fish appertaining to it, we may, without boasting, consider ourselves masters of a position which, beside providing sustenance for the many, adds largely to our national

resources. None, certainly, of the European territories are favoured to such a large extent; and although France, Holland, Russia, and Sweden, not to mention the powers established on the Mediterranean shores, continue to take an interest in their sea-fisheries, the demand in their several markets being always on the stretch, it is utterly impossible, so long as Great Britain and her North American colonies can preserve to themselves their presently acknowledged rights, that the powers above-mentioned can cope with the latter on this field of favour. As a branch of the tree of industry so perseveringly cultivated in Great Britain, the prosecution of our sea fishings may be pronounced with confidence the oldest and in a certain sense the most flourishing. The Romans, under the Empire, recognised it as a very important one, and traded with us accordingly; their trade usually being that of compulsion—not, perhaps, resulting in the main to the credit of the British coffers. We have it on record that the costliest of sea-fish—red-mullet and John Dory, with their appropriate garniture of lobster and oyster, the tit-bits of the *coena*—were the products far-fetched of the surroundings of our native isles. The prices commanded in the Latin market by those and other rarities culled from our sea-coasts approached the fabulous. But to regard this branch of industry intelligently—to understand its real importance and gain a knowledge of the expenses incurred in its pursuit, of the risks involved; and, looking on the other side of the question, to view it as the means of bringing to bear much endurance, dare-devil courage, home attachment and patriotism on the fortunes of our mother-land—to do this effectively, is to devote a large amount of careful attention to the subject. The prosecution of our sea-fisheries is vitally bound up with the prosperity of the British Empire. We can trace to it, in a measure, our maritime superiority, our unsurpassed naval architecture, and the enterprise of our merchants; but we can also refer to it, not with so much exultation perhaps, but in a utilitarian view of the matter as satisfactorily, as a means of supplying the home, let alone the foreign market, with an amount of wholesome diet almost beyond calculation. Notwithstanding the diminished observance of Lent, the demand for fish-food may be well called insatiable; and the prices exacted, exorbitant in some instances beyond justification, correspond generally to that demand. In regard to one species of fish, the halibut, which in our younger days was looked upon almost with contempt as the basest of offal (a market expression), fetching 1½d. per pound, the revolution of opinion is very remarkable. It now holds a position in the market approaching to that of the sole and turbot, and commands a price five or six times as great as it formerly did. In seeking for an explanation for this from an eminent Scotch fishmonger, we were told that the halibut is the favourite food of the Jewish community in England—numbering in London alone upwards of 40,000—and that during the Passover preparation weeks it is run upon to an excess. The mode of cooking it at that period is by means of the frying-pan and olive or other vegetable oils.

The subjects "Deep-sea Fishing" and "Fishing Boats" of Mr. Holdsworth's work, portions of which appeared from time to time in the *Field*, are rendered interesting to the general reader by the masterly way in which they are handled. The author's well-known name, and the post recently held by him as Secretary of the Royal Sea Fisheries Commission, are guarantees for the accuracy of the information given in the volume before us. As far as extent goes, that information may be said to be almost exhaustive of the subject under treatment. The description of the boats, nets, and tackle employed in the prosecution of our sea-fishings is minutely, but not, considering the vastness of the field embarked on, the less graphically rendered. To the varieties of the fish frequenting our coasts, which find their way acceptably into the home and foreign markets, great attention is given, and the different modes of capturing them are carefully described and commented on. Among other subjects brought under notice is the reputed desertion of Loch Fyne by its celebrated herring. This desertion, or diminution as respects yield, is attributed to several causes. We shall only deal with the last of them, and seemingly the most improbable, viz., "that the volunteer artillery is believed to scare away the fish," p. 329. In this explanation of what has happened, there is more reason than one might suppose. Our own experience, when jigging for herring in July, some years ago, off Eyemouth, leads to the conviction that this fish, congregated as a shoal, is delicately apprehensive, we do not say of sound, but of the motion or tremor communicated through its means. The approach or passing of a steamer, although at the distance of two or three miles, had invariably the effect of shifting the position of the shoal and throwing the herrings off their feed. It is quite possible, we think, that the artillery practice carried on vigorously on the west coast of Scotland may have had, to some extent, the same effect. The conclusion come to in a certain high quarter with respect to the alleged falling off, viz., that it is a judgment upon the Sabbath-breaking portion of the fishing population of this district, has certainly feebler grounds to rest on, seeing that that portion of the population can hardly be detected, even by units, and will stand, in point of force, no comparison whatever with the Sabbath-breaking populations in other quarters upon which no such judgment has fallen.

In the division made of trawled fish for market purposes into two classes, prime and offal, we are informed in Mr. Holdsworth's introductory remarks that the haddock finds its place in the latter class. The term "offal" is certainly reproachful, but its application to that fish does not disturb the generally acknowledged fact, that when in condition, the haddock as an article of diet is superior to any fish taken off our coasts, and will stand comparison at table with the mullet and John Dory. The scarcity of the latter, of course, helps, apart from their excellence as food, to give them their position in the market, but it is not a deserved one.

There is a great variety of matters in connexion with our sea fishings treated of in this admirable and instructive work, but to

bring these individually under review within the space apportioned to us is quite out of the question. All we can say is, that the labour of collecting information on so important and interesting a subject, and of arranging it so as to facilitate its thorough comprehension by the reader, on every pertinent point, could not have fallen into abler hands. The illustrations and drawings, which are numerous, amounting to more than two score, have been executed, as we are informed in the preface, by Mr. Holdsworth himself on wood and steel, and represent with marked fidelity the various minute details characteristic of the fishing-boats and gear employed on various parts of the coast.

We cannot too highly recommend this very comprehensive treatise on our Sea Fishing and Fishing-boats, expressing at the same time our assurance that its merits will be generally recognised. T. T. STODDART.

Registrum Palatinum Dunelmense: The Register of Richard de Kellawe, Lord Palatine, and Bishop of Durham, 1314-1316. Vol. II. Edited by Sir Thomas Duffus Hardy. (In the Master of the Rolls' Series).

We take up, with peculiar pleasure, another volume of this Episcopal Register, for which we have to thank the Master of the Rolls and Sir Thomas Hardy (the editor). We can only wonder that it has been allowed to remain so long in MS., when we consider its value in connexion with the early history of Durham, where documents of this nature have not been allowed to lie hid to all but a few in the recesses of some dingy closet. The book had found its way from Durham to the Bodleian Library, whence it was restored to its old home, at the request of Bishop Barrington, for the special use of the northern antiquaries. We are delighted to see it in print. As an episcopal register of the period it does not, perhaps, take the highest rank; but it is full of interest to every native of the Palatinate. To us, when we read it, almost every page has its associations. The index at the end was compiled by the late Dr. Raine, and this was perhaps the first early MS. which his son essayed to read; and dire were the troubles of the youthful student, and badly would he have fared, if unassisted by the kind and practised eyes which were never weary of overlooking him.

Bishop Anthony Bek died in 1311, and the prior and convent of Durham, the electors to the see, picked out as his successor a plain, simple member of their own body, as unlike his predecessor and successor as it is possible to imagine. The monastery had suffered too much at Bek's hands to make its inmates wish to subject themselves to even the chance of a continuance of his iron rule. In Richard de Kellawe they found a superior who was docile and friendly. To the Archbishop of York, throughout his life, he was a dutiful suffragan; to his former brethren he was a generous and warm-hearted patron. The register of his acts as Bishop shows that he was a quiet order-loving man, who had learned his duty in a gentle school. He derives his name from

the little village of Kelloe, in the eastern part of the county of Durham. The Kellawes were persons of some mark and antiquity there; they possessed a charter-horn as a title to their estate, and several members of the family distinguished themselves in the field. Patrick, a brother of the Bishop, was a noted enemy of the freebooters, *shavaldi* as they were called, who devastated Northumberland. "Shaveling" is, perhaps, the best translation of this word. There is no danger, in this case, of our associating it with monks.

There are several documents in existence prior to the time of Kellawe which serve as an introduction to his Register, and make us acquainted with the ecclesiastical history of the diocese of Durham at that early period. The Act-Books of the prior and convent, beginning in 1280, and containing the papers relating to the churches in their extensive jurisdiction, are still preserved; and there is also in the British Museum, a fragment of a Register of Bishop Bek containing the appointment of some of the officers of his court and diocese. When Bek died, the Archbishop of York went northwards, and held an enforced visitation. The greater part of the immense roll which narrates the proceedings of the visitors exists in the York Registry, and gives us the earliest list that we possess of the incumbents of the Durham benefices. Next in sequence comes the Register of Kellawe, the second volume of which is now before us. The documents that it contains are necessarily of a most miscellaneous character. We shall select a few to remark upon; but they can only be a few.

The volume opens with what is at that early period a document of rare occurrence, a minute inventory of the effects of Sir John Fitz Marmaduke, which is of much value as to words and prices. Sir Thomas Hardy remarks that the adding up of the money is faulty in more places than one. This, however, is frequently the case in mediæval accounts, and it is marvellous that with so pretentious an assumption of minute accuracy, there should be so many blunders in documents of this nature. The inventory of Fitz Marmaduke is a representative of its class. He was the descendant of an old Palatine family, a courtier and a soldier of no mean rank. He died at Perth, keeping that fair town for the king of England. By his will he desired that his body should rest in the cemetery of the church of Durham; no one, save Bishop Anthony Bek, having as yet been interred within its sacred walls. To carry out the testator's wishes, his executors cut his corpse in pieces and boiled it, that they might be able to convey the bones to Durham. But even then their difficulties were not over. They were obliged to get a dispensation from the Papal court to sanction their lord's interment (p. 1149). This is not the only painful incident in the history of the house of Fitz Marmaduke. Sir John, of whom we have been speaking, was divorced from his wife, Ida de Neville, who had much litigation with her son Richard (pp. 945-6, 997-8, 1085-6). This Richard was afterwards killed on Framwellgate bridge, in Durham, by Robert de Neville, the "*pavo septentrionalis*," as he was called. The litigation which has just been men-

tioned was probably the cause of the fray. The slayer and the slain were both of them retainers of the Bishop of Durham, and it was under the shadow of his noble castle that they fought. The "peacock," in a later day, was shorn of his own plumes at Berwick.

There is a notice in this volume of another outrage, which, even in those days of lawlessness, must have been regarded in Durham with peculiar horror. I mean the murder of Sir John Spring, knt., by Robert Lascels, who seems to have been a free-booter of renown (pp. 921-2). We are left in ignorance of the details of this outrage. Happy ignorance for us! The imagination of the late Mr. Surtees stepped in to fill up the void with the most beautiful of his ballads. Similarity of name made the historian of Durham associate the murdered knight with Houghton-le-Spring, where "in the southern aisle," or, rather, transept, there is still laid the effigy of a nameless warrior. Mr. Surtees, however, was in error. Sir John was the lord, not of Houghton-le-Spring, but of Houghton-le-Side, an obscure village in the southern part of the county, lying under the steep crest of the hill which looks down into the rich valley of the Tees.

Outrages like these afford good evidence of the lawlessness of the times, a lawlessness which was by no means confined to a few. The invasions of the Scots broke up the foundations of order, and subjected the country for years to the violence and extortion of marauding bands of English and alien banditti. The most sacred sites afforded no protection to their inmates. On one occasion the monastery of Holy Island seemed to have been deliberately stripped (pp. 744-5), nor did the memories of Cuthbert keep the robbers away from his island home (pp. 734-5). The experience as well as the anticipation of invasion paralysed industry and commerce. Tithes could not be gathered, rents were unpaid, the land was frequently untilled, and there were no cattle to graze in the deserted pastures. We have a curious picture in this volume of an accident which occurred at Houghton-le-Spring in 1315. While a Scottish army was sweeping up the vale of the Wear, a number of the villagers fled to the tower of their parish-church for safety and curiosity. One of them, careless of his feet, stumbled as he was descending, and was killed by the fall (pp. 718-20). In the tower of many of the northern churches you will still find a room, to which at least the priest could flee when danger was abroad. When the enemy drew near, he pulled up his ladder and let down the trap-door, and it was not worth the aggressor's while to loiter there in the hope of starving out the defiant cleric, or of taking his little fortress by storm.

Bishop Kellawe's register contains a remarkable number of indulgences, especially to those who volunteered their prayers for certain persons who had recently died. Similar privileges may be observed in other episcopal act-books of this period, but not in such numbers. It is remarkable also to observe that they extend over the whole of England. How were they acquired?

They were probably granted through the medium of some *breviger* who travelled about the country, from diocese to diocese, with a formal letter of request in his burse. A money payment to some person or other was no doubt an accompaniment of the grant. Perhaps, as was the custom among religious houses, there was in these cases also a promise of reciprocity.

"Vestris nostra damus, pro nostris vestra rogamus."

We observe in this volume several documents of great importance, which were entered on the bishop's register, not only for his guidance, but also for the purposes of record. Among these we may mention the fine inquisition relating to the barony of Gainford and Barnard Castle; the perambulation of the forest of Galtres, and the valuable papers connected with the Wapontake of Ouse and Derwent (pp. 795, 1114, 1183, *et seqq.*). It is easy to see how important such papers as these would be in future years, not only to the bishops of Durham, but also to the general enquirer.

It was impossible for any mediæval bishop to maintain his position efficiently unless he attached to himself, by pensions or livings, a little troop of lawyers who would remember their patron in the king's courts, and assist him with their advice in his difficulties at home. Accordingly, we find Kellawe relying upon the tried support of Mettingham, Osgodby and Trikingham. Of Richard de Eryholme the bishop made great use. He began life in 1304 as a poor clerk, but lived long enough to make himself almost indispensable to the chief ecclesiastical personages in the north of England. We find several other clerks of distinction and learning benefited at the same time in the diocese of Durham. William de Armin, who became Bishop of Norwich, was sometime rector of Bishop-Wearmouth; and Robert de Baldock, rector of Whickham, in after years was raised to the see of London. For Louis de Beaumont, Kellawe's successor in the bishopric, a prebend was found in the collegiate church of Auckland. In Roger de Waltham, who was in several ways connected with the diocese, we have the author of a treatise of considerable repute in his day. We find Stephen de Mauley, Archdeacon of Cleveland, still holding the benefices with which his kinsman, Bishop Bek, had endowed him. It was at Mauley's most earnest solicitation that the translation of the remains of St. William of York was carried out, and he survived his first patron to see one of his own nearest relatives falling under the cloud which had at one time overshadowed himself.

Kellawe held the see of Durham for too short a time to accumulate any of the wealth which other tenants of that high office have so frequently amassed. The Scottish inroads kept him continually poor, but he could still be generous. To the monks of Durham, Kellawe was on all occasions a kind benefactor, although they sighed in vain after the books and silver plate and the furniture of the bishop's chapel which he is said to have promised to them. For his successors in the see Kellawe built an episcopal residence at Stockton-upon-Tees, and another, on a much larger scale, at Welehall,

which lies on the Ouse between York and Selby. There is a survey of this place in existence which was made in the sixteenth century, when Bishop Barnes began to regard his numerous episcopal residences as an unnecessary luxury. The site is now occupied by a farm-house, but a great portion of the old structure seems to have been in existence at the commencement of this century.

Bishop Kellawe died in the lesser chamber within his castle of Middleham on the feast of St. Denys, 1316. He had previously made a short will, which was proved in the archiepiscopal registry at York. They carried his remains to Durham, and laid them in the chapter-house of the Priory, under a marble stone, which was covered with brazen imagery, before the bishop's chair. Thomas Earl of Lancaster, "*indignus quem mors tam saeva maneret*," was present at the interment, and made a rich offering; although he seems to have been thinking at the time more about the new prelate than the old. Edward II., also, who was holding his court in the neighbouring city of York, sent some clothes of gold fabric to be laid upon the tomb.

The beautiful chapter-house in which Kellawe was laid was mutilated by Wyatt, the so-called architect, at the close of the last century. The apsidal portion of the building was removed, and the space which it occupied was thrown into the dean's garden. Within the last few months this space has been carefully examined. A great part of the pavement of the old room was found beneath the soil, and some most remarkable discoveries were made. Two courses of interments were detected. On the lower level the bones of women and children were observed, showing that the Norman chapter-house had been erected on a portion of the cemetery of the Church of Durham, when its inmates, as Symeon complains, made no profession of celibacy. Above these graves lay Flambard, Puiset, and other royal prelates, who have given to Durham a world-wide reputation. Three noble pontifical rings of gold set with sapphires rewarded the zeal of the searchers. In this illustrious company, in the place marked out by history and tradition, was found Kellawe's grave. The sculptured grave-cover had disappeared, but there could be no question as to the identity of the tomb. There were in it a few memorials of the dead. The bones indicated a man of short stature; some white hairs were still clinging to the skull. A fragment of a pastoral staff of wood was lying by the side of the corpse, and some pieces of a woollen dress were found as well. The bishop had evidently been buried, after the simple and touching fashion of the time, in the garb which had been familiar to him from his earliest years, the cowl and habit of a Benedictine monk. These monuments of the illustrious dead are, we are glad to hear, to be duly renovated and cared for. We should be better satisfied if the glorious apse which sheltered them were again set up. The Dean and Chapter of Durham owe some reparation still for what we may almost call the crimes of their predecessors.

JAMES RAINE.

1. *The Chess Player's Manual*. By G. H. D. Gossip. (London: G. Routledge & Sons, 1874.)
2. *Synopsis of the Chess Openings*. By W. Cook. (London: W. W. Morgan, 1874.)

THE scientific study of chess openings, which of late years has made such remarkable progress, is the work of foreigners. The foundations of our existing knowledge were laid by the Russian, Jaenisch, whose *Analyse Nouvelle*, published in 1842 and 1843, was a veritable cyclopaedia of the knowledge of his time, supported by profound original research. He was a true enthusiast, and his characteristic assertion, that the bishop's gambit was an imperishable monument of human wisdom, would startle and amuse laymen, who are not accustomed to associate wisdom with the laborious study of a game.

About the same time, Von Heydetraut, the Prussian Ambassador in Denmark, published in the name of his deceased friend Von Bilguer the first edition of his *Hand-Buch*, the improvement of which in repeated editions, of which the last appeared this year, has been a labour of love to the Prussian diplomatist since that period. In this work he has embodied all the results of modern analysis, as worked out by Neumann, Paulsen, Zuckertort, and others of the German school, and from it as from a mine every modern writer on chess must take his materials. In this, as in probably many other subjects, English writers can only attempt to popularise the ponderous results of German learning. The fair critic would no more demand originality in a treatise on the chess openings than in a popular exposition of modern science, and the only question he can fairly ask is whether the work under notice represents more fully and accurately than its predecessors the knowledge of the time.

Both the books under review are the works of English provincial players, and pre-eminence in actual play is certainly not required for success in such an undertaking. Much idle comment, as it appears to us, has been made on Mr. Gossip's pretensions as a practical player. We believe that he takes rank fairly in that strong phalanx of English amateurs to none of whom Steinitz, the best player of the day, could concede successfully the pawn and two moves, odds which it was the belief that Des Chappelles in France, and Staunton in England, could yield to all comers. There may be half-a-dozen English players slightly superior to Mr. Gossip, but the point is of utter unimportance with reference to his book, and has probably been raised solely on account of the soreness evidently felt by some players of reputation on account of the publication of games in the *Manual* won by Mr. Gossip of the leading players of the day. It has been even hinted that some of these games are apocryphal. Now, if not meant as a poor jest, this is a grave charge. We do not believe that Mr. Gossip has created the games in question, like the German's camel, out of his mental consciousness, and it is a matter of surprise to us that any player can object to the publication of a

game lost to a weaker opponent by the latter. It is the acknowledged weakness of the chess-playing community to remember only won games. Mr. Staunton in his books and magazines rarely published his defeats, and we can pardon Mr. Gossip for remembering with natural pride the games he has scored against players slightly his superiors. Out of 252 illustrative games, which form a most interesting portion of the *Manual*, there are thirty-nine played by Mr. Gossip against the strongest men of the time, of which he won twenty-seven, drew seven, and lost five. Some of these games are intrinsically good; others, though poor, are useful to the learner by showing how to take advantage of a weak defence. We cannot believe that Mr. Gossip's readers would be led by the publication of these games to suppose that in practical play he is the superior of many of his celebrated antagonists; but we regret the obtrusion of his own personality in his book, which is doubtless the cause that the industry and knowledge displayed by him have not met with fair acknowledgment.

There is another like weakness which detracts from the merit of the book. There is probably nothing so astounding to the outside world as the earnestness with which most writers on Chess lay claim to originality in their variations. It seems hardly possible that reasonable beings should fight about the honour of having been the first to suggest the move of pawn to queen's fourth in some variation of a gambit, or any other equally profound discovery. Unhappily, Mr. Gossip is not contented with the praise of a useful compiler, but at times speaks of well-known variations (see p. 423) as if they were his own invention. It is quite possible that in this instance he did strike out the moves given in actual play. There is nothing recondite about them, nothing which any acute player would not see at a glance; but the variation was well known years previously, and it is really a matter of perfect unimportance to any sensible man whether that or any other move was first played by Paulsen, Zuckertort, Gossip, or any other laborious trifler. It is a matter of fact that the same move will occur simultaneously to different players. This was notoriously the case with the Cochrane-Schumoff variation of the Scotch gambit, so called from having been tried at the same time, and without concert, by Mr. Cochrane in India, and Schumoff in Russia. A singular variation in the Q B P game in the knight's opening, by which on the fifth move the second player sacrifices his Q Kt for a strong counter-attack, was to my own knowledge struck out in play with myself by a native player in Madras about the time that I believe it was first introduced in England. At any rate I know that the move was quite unknown to myself and my native antagonist when he to all intents and purposes invented it. Mr. Gossip is evidently over-impressed with the importance of his subject, and constantly states about some move that it was first played by such and such a player in some particular game. Such may or may not be the case; it is a fact not worth recording; and we wish that chess writers would remember that they are merely teach-

ing a game, would leave all names out of the question, and would content themselves with showing the best mode of play. The learner cares nothing for the sources of his information, he requires only to attain proficiency in his pastime.

There is nothing in which custom is more capricious than in the popularity of the different chess openings at different times. As Horace said of words:—

"Mortalia facta peribunt,
Nedum sermonum stet honos et gratia vivax,
Multa renascentur quae jam cecidere, cadentque;
Quae nunc sunt in honore vocabula; si volet usus,
Quem penes arbitrium est, et jus, et norma loquendi."

Jaenisch's monument of human wisdom, the bishop's gambit, is now rarely played, and the laborious defence which he took years to elaborate, and the analysis of which was the pet portion of his great work, has been entirely thrown over. The Muzio gambit, and other adventurous openings, are now seldom played for the attack, and few men in a contest of importance would face the defence of the Evans'. This is of course the result of the extent to which the analysis of these openings has been carried, and the fact that a lost game in the opening is often certain through a lapse of memory or deficiency in book knowledge. When a few years ago an American youth came to London, and like an eagle in a dove-cote fluttered the Volscians in Corioli, his success must be partly attributed to his wonderful memory, through which he never forgot a chess position, and repeatedly caught the old London players in traps in the openings which they had once known and forgotten. Now, without a knowledge of these pitfalls, a player of the strongest natural powers must come to grief; and as the theory of the openings is constantly encroaching on the boundless ocean of the middle game, even the proficient who wishes to hold his own must rely on some guide to help his failing memory in these ever-growing intricacies. I have carefully gone through Mr. Gossip's chapters on the Giuoco Piano, and the Algaier, as a test of his work, and find them to contain the fullest information to be met with in any English book. Mr. Gossip's statements are sometimes confused, there is often a want of order in the arrangement, but the learner will find the very strongest forms of attack and defence given, including recent discoveries, which only great industry could have brought together, and in return for really valuable information on the subject we may overlook the personal foibles of the author, which are somewhat too apparent in his work.

We have little space left to speak of Mr. Cook's synoptical tables, of which we can write only in hearty commendation. This little unpretentious work almost reaches our standard of what such a treatise should be. In simplicity of form, clearness, and order, which with accuracy and completeness form the whole merit of a compiler, these tables surpass any English treatise that has yet appeared. They are very accurate as far as they go, but they are not complete, owing to the brevity and cheapness of cost which were the conditions imposed by the author's aim. The real use of such tables is for ready reference. Chess theory has become so unwieldy, that no ordinary memory can

carry it; and in actual play the proficient, when contending with a master of book learning, must either abandon the majority of the most interesting openings, and, like Mr. Owen, resolve every contest into some variety of the close game, which destroys the principal charm of chess, or avail himself of some safe guide in the intricacies of the dangerous gambits. The ordinary system of notation, adopted by Mr. Gossip and all his predecessors, is well enough for teaching learners, but it is hopelessly cumbersome and perplexing for a book of reference. Among the variations specified by all the letters of the alphabet, and numbers innumerable, it is hardly possible to find out the move wanted in any particular instance, while life is too short to wade through the mass of undigested German learning to obtain assistance in a game. We hope it may not be long before Mr. Cook may be called on to produce a second edition of his tables, and we would suggest to him to omit the illustrative games he has, according to custom, added to his chapters, and to make his tables a little more complete. Such a change need add nothing to the price of his book, which would probably be soon considered indispensable by every chess player who aims at excellence, and yet cannot devote a life to the study of the German *Hand-Buch*.

JAMES INNES MINCHIN.

NEW NOVELS.

Wyncote. By Mrs. Thomas Erskine. (London: Smith, Elder & Co., 1874.)

Lizzie. By Lady Duffus-Hardy. (London: Hurst & Blackett, 1874.)

Vanessa. By the Author of "Thomasina." (London: Henry S. King & Co., 1874.)

Barriers Burned Away. By the Rev. E. P. Roe. (London: Routledge & Co., 1874.)

NOVELISTS sometimes complain that reviewers do not judge their works fairly, but use them as mere opportunities for saying smart things. They do not remember what Lessing said about the quantity of pain a man of taste suffers before he is goaded into retaliating. They have no idea what weary work it is to toil through tedious stories about impossible characters, related in slipshod English, till the almost extinct passion of revenge is aroused in the breast of the critic. He has only a few lines to express his pain in, while the novelist torments him in three bulky volumes. So there is often a good deal of temper in a criticism, and, on the other hand, gratitude for a readable story sometimes draws forth exaggerated praise.

Wyncote is so good, such an oasis in the desert of nonsense, that perhaps we over-estimate its excellence. It is admirable for observation, for humour, for pathos; it is refined without affectation, and interesting without effort. Even the subordinate characters—the supernumeraries who only cross the stage—are carefully studied and full of life. Nothing could be better than the bustling and good-natured Lady Wargrave, who "always said every one was looking so well." The Marquis, who boasted that his house was furnished "out of the wrecks of empires," is almost worthy of Mr. Disraeli. And most of us know Mrs. Foster, that

anxious and evangelical woman, who dreaded the heretical influences of the study of flint arrow-heads.

It would scarcely be fair to give the story of *Wyncote*, for, although there is nothing complicated in the plot, readers are likely to take sides with the characters, and to think the tale ends well or ill, as they sympathise with the fortunes of this or that heroine. There are, as in the old French song, *trois filles à marier*, and the question is, who is to win the not very interesting hero? We think the story ends badly, in the novel-reader's sense of the word. But that is a matter of taste. It is pleasant to find that the young lady who models herself on Mr. Ruskin, and delivers lectures on wall-papers, has at last found a writer to do her justice. The tragedy of the old maiden aunt Camilla, who has a love-story in her past, and who has sacrificed herself to regard for her family honour and her family estate of Wyncote, is less interesting on the whole than the tragedy of the younger heroine who is condemned to wear the willow. We hope to meet with her again, either in the English or the Italian surroundings which Mrs. Erskine renders so faithfully. She is much too good a character to break her heart about the man of business who unwittingly gained her young affections. *Wyncote* may be recommended safely even to people whom a long experience of stupid novels has soured and blighted.

At this period of the world's history, when all our teachers are at one about the fact that "we do indeed live in days," but when no two agree as to what kind of days we live in, it is pleasant to meet with a writer like Lady Duffus-Hardy who has a *formule de la vie* of her own. Lady Duffus-Hardy is not unaware that these are troubled times. A great and good ruler has been driven from the throne of France, a Republic is struggling for existence in Spain, and there is only too much reason to fear that some horrid *foreign* notions may spring up in England. One hears of the rights of labour; even the rural population is showing signs of corruption and discontent; all sorts of mere rich people are pushing their way into society. In these sad circumstances, where can we look for hope and comfort except to the landed gentry? Lady Duffus-Hardy feels that, if only people would be guided by county families, all might yet be well. This is the moral of *Lizzie*, a story in which the ways of county people are justified to men. Lady Duffus-Hardy tells us many new and beautiful things about the landed gentry. They breathe a different air from the *nouveaux riches*; she says, "the very atmosphere which pervades the ancient houses of the old aristocratic race seems different from the common air we breathe." Naturally we are anxious to hear more about the Olympian dwellers on the heights. And first, we learn that, like the gods, the old aristocratic race speaks a tongue unknown to mere literary people. They say "aggravate," when we say "irritate" or "annoy." And they sometimes construct their sentences without the base mechanic aid of verbs, as, indeed, their very pronouns stand forth bold and free, without reference to mere substantives. Their adverbs they

form with a fresh originality: thus they say "exteriorly," not "outwardly." Their manners are not less peculiar than their speech. Colonel Pomeroy, the fine old English gentleman of the tale, calls the lady to whom his nephew is engaged "the spawn of Groves," which recalls the eloquence of Burke denouncing Jean Jacques. The nephew tells his cousin that he can "dispense with her presence," in her own drawing-room, and accuses her before her father of loving himself, and being jealous of the woman he loves. On hearing this she takes the aforesaid spawn to her heart!

All this, and much more, about people we know so little of, rather diverts attention from the story, which is told with a good deal of spirit. Colonel Pomeroy was one of the members for Padborough, and gave offence to his constituents by voting against the Reform Bill. One Groves, an adventurer, stirred up discontent, and by the aid of Walter Haviland, a sort of ferocious "Gifted Hopkins," or an Alton Locke seen on the seamy side, became Mayor of Padborough. Lemuel Pomeroy, the Colonel's nephew, loved Groves's daughter Julia, a beautiful olive-complexioned woman, such, we are told, as Rubens loved to paint. Haviland's sister loved Abel Harries, the son of "a thorough-going hard-paced Christian," after the Colonel's own heart. Now, Miss Haviland, who had recently come home from California, knew that Groves had killed her father there, and when Groves discarded Walter Haviland, that poet and politician accused him of the crime. It is easy to imagine the struggles in the souls of the noble Pomeroy when Lemuel insisted on marrying the daughter of the disgraced Groves. Marry her, however, he did, and poetical justice was fulfilled when Haviland went mad and strangled the ex-mayor, thereby showing that people who resist county families never prosper, and are lucky if they escape the gallows; whereas all things work together for the good of "thorough-going hard-paced Christians." The aristocratic characters seem to us rude and coarse, and Alice Pomeroy is a mere shadow. Lizzie Haviland and her lover are pleasantly drawn, and there is some power in the description of Walter Haviland's mad conceit.

The story of *Vanessa* may be briefly told. Amy and Helen Mertoun were poor but honest. Helen took in sewing; Amy, who, we are informed, was like a Dresden china figure, and also like one of Raffaele's early Madonnas, pined for the society of her wealthy uncle Richard and her cousin Eva. Her brother Henry and the rest of her family disliked their opulent relatives, who were very decent people. Amy was invited to pay them a visit, discarded her lover, a beetle-hunting young banker's clerk, and captivated Lord Alan Raeburn, who had madness in his family, but who even in his wildest moments spoke like a printed book. Indeed, all the characters converse in pompous latinised English. Lord Alan had flirted with Amy's cousin Eva, but could not resist an opportunity of carrying away Amy in his yacht. A storm arose, however, and Amy was very unwell, which had formed no part of his profligate scheme

of pleasure. The rash pair went to London together, and there a mild remonstrance from the beetle-hunter induced Lord Alan to give up his "profligate scheme of pleasure," and marry Amy. His family made the house of Raeburn—which name, by the way, it is scarcely fair to drag into a novel—rather a miserable abode to Amy, and Lord Alan went mad and died. Meanwhile Helen fell in love with the beetle collector; cousin Eva paired off with brother Henry, and a casual farmer with poor Amy. They all lived happily ever after, and kept up a high standard of English conversation. The moral appears to be, that it is an error to elope in a yacht with a girl who is a bad sailor. The book has nothing to recommend it, but it might have been worse—it might have been in three volumes.

Barriers Burned Away bears no date that we can discover, but from the allusions to the fire at Chicago it must have been written in the latter part of the present century. It is of the good goody, and we are asked to interest ourselves in the soul as well as in the heart of the heroine. This young lady was brought up by a father who believed in nothing but culture, not even in a stream of tendency. As a natural reaction she loved a young fishmonger, and when she lost that illusion she also believed in nothing and nobody, not even in *Literature and Dogma*. This might have seemed an eligible opportunity to invent a new formula of life, but she was recalled to the views of the American Low Church party by a serious young man, named Dennis, and there is a queer picture of the lovers embracing each other amid the ruins of Chicago. We don't care for novels of the soul, or for the constant introduction of the most sacred names into the most feeble twaddle; but "about obvious nonsense," as Thucydides says, "why make a long story?" A. LANG.

CHRISTMAS BOOKS.

The Hanging of the Crane. By H. W. Longfellow. With Illustrations. (Routledge & Co.) The poem is a short one, in Mr. Longfellow's usual style. It is a series of reflections on the history of a family, prompted by the New England custom of holding festival on the occasion of hanging the crane in a new house. Several lines of it are as pretty as the following, which describe the little children in the home:—

"The King, deposed and older grown,
No longer occupies the throne;
The crown is on his sister's brow,
A princess from the fairy tales,
The very pattern girl of girls,
All covered and embowered in curls
Rose-tinted from the Isle of Flowers,
And sailing, with soft silken sails,
From far-off Dreamland into ours.

Nor care they for the world that rolls,
With all its freight of troubled souls,
Into the days that are to be."

Some of the illustrations are pretty, but there is far more blank paper than printed matter in the book. There are thirty leaves of paper entirely blank; there are only nineteen on which any of the poem is printed. If we wanted a prettily-bound commonplace book, there is enough blank space in the one before us to contain numerous extracts, and the poem would come in here and there among them without losing

much in force. But no one wishes a commonplace book to be associated with the name of Mr. Longfellow.

Children must have been more than usually naughty during the past year, to require that so many of the Christmas books should be in a moralising strain. The fairy tales are allegories; the stories are founded on fact; the very pictures are full of hidden teaching. There are two or three refreshing exceptions, and one of the best of these is a book called *Merry Elves, or Little Adventures in Fairy Land*. With twenty-four illustrations. By C. O. Murray. (Seeley, Jackson & Halliday.) The pictures are very funny. The most superior child could hardly fail to laugh at the two little elves Bindweed and Dandelion on the back of the Toad, and their subsequent cold bath; or at Gobble with the Hedgehog; or Perks the woodpecker devouring Blob the spider, and rescuing Rosywing. The illustrations tell most of the story, but the letterpress is very good also, naive and unaffected. There is no moral to any of the stories, except that a grand Nemesis goes through them all, and in every case our sympathies are enlisted on the side of justice.

The Fantastic History of the Celebrated Pierrot. Written by the Magician Alcofrabas, and translated from the Sogdian by Alfred Assollant; rendered into English by A. S. Munro. (Sampson Low & Co.) This is a fairy-tale from the French, clever, amusing and full of the marvellous. Pierrot is a real hero of romance who triumphantly overcomes all difficulties. He made himself, at an early age, the right-hand man of "Vantripan, Emperor of China, Thibet, Mongolia, the peninsula of Corea, and of all the Chinese, crooked or straight, black or yellow, white or tawny, whom heaven has placed between the Karkounoor and Himalaya mountains." He fought the Tartars for Vantripan, and by the help of his fairy godmother, a hundred thousand of the enemy were disposed of with a look. He overcame the giant Pantafilando—a giant who was in the habit of throwing one of his generals at the head of any refractory person. To add to his other achievements, Pierrot swam across a river with his lady-love in his arms; but his lady-love proved false, and he finally took comfort in the modest virtue of Rosine, a country neighbour. After numerous adventures, he establishes the kingdom of China in safety, and dies a good citizen. The pictures by Yan Dargent are unnecessarily horrible, and some of the scenes in the Satanic regions might have been omitted without injuring the story.

Whispers from Fairyland. By the Right Hon. E. H. Knatchbull-Hugessen, M.P. (Longmans & Co.) This is a much pleasanter book than the one Mr. Knatchbull-Hugessen published last year. There are seven stories in it. Perhaps the best of the seven is "The Silver Fairies," which is the story of an old milkman who bought a curious haunted cabinet at an auction. This cabinet proved to be the home of the fairies, who bestowed unlimited wealth on the old man, until he grew discontented with his lot as a milkman, got into Parliament, made a fool of himself, and finally was glad to return to his trade. The "History of a Rook," too, is an amusing story in the same collection; it is in the form of an autobiography, and there is a solemn rook-like dignity in the way the story is told that considerably heightens its effect.

The Little Lame Prince and His Travelling Cloak. A Parable for Young and Old. By the author of "John Halifax." (Daldy, Isbister & Co.) This book is honest, at any rate: it says openly that it is a parable. Its readers must be left to find out for themselves what it means. Some of it is pretty enough, for the writer can give a charm of her own to whatever she writes, but as a whole there is a general impression of dreariness left on the mind by it, something like the flat level plain upon which the hero, poor

little Prince Dolor, looked out from Hopeless Tower. The little grey woman who is the good genius of the book, reminds us of the Irishwoman with the grey shawl in the *Water Babies*—perhaps they are one and the same person, and if so there is no reason why she should not appear in any number of books—but why must she always be associated with grey?

Songs of Our Youth. By the Author of "John Halifax." Set to Music. (Daldy, Isbister & Co.) This book is beautifully got up. The prettiest of the songs are those which are set to Swedish airs; perhaps the best is one called "Say farewell and go," which is very pathetic and pretty; but they all belong to the class of quiet fireside music, which never fails to find an appreciative audience. The air to which the well-known words of "Douglas" are set does not seem so appropriate to them as that which Lady John Scott wrote; but it is daring to say so when it is composed for them by the author herself.

Paws and Claws: being True Stories of Clever Creatures, Tame and Wild. By One of the Authors of "Poems written for a Child." (Cassell, Petter & Galpin.) This is a very safe and pleasant book for a little child. The pictures are charming, and the stories, though not very remarkable, seem to be true (one of the best of them is the story of the goose who led a blind woman to church every Sunday); but the book rather gives one the impression that it has been written for the pictures.

Aesop's Fables translated into Human Nature. By Charles H. Bennett. (Chatto & Windus.) The illustrations are cleverly done in the broad comic style. One of the best is that of the "Lion and the Gnat," where the lion is represented as a frantic author tormented by a gnat-like man with a hurdy-gurdy.

Routledge's Every Boy's Annual for 1875. The principal attraction of this volume is Jules Verne's serial story "The Field of Ice," which is as full of circumstantial impossibilities as his other books. It is hard to believe when we have finished it that we have not stood with Captain Hatteras at the North Pole, that the bears have not really blockaded us into our house with snow, and that we have not seen the hares of the northern summer leaping round us. The rest of the volume is poor by comparison, in spite of all that Messrs. Routledge have done for it in the way of attractive binding, coloured illustrations, &c. There is the usual amount of puzzles and magic, and hunting adventures; and there are some foolish sentimental stories which would be much better away. They are not good for schoolboys, even if they liked them, which the best and healthiest boys do not.

The Society for Promoting Christian Knowledge has brought out a very pretty book for the drawing-room table called *Beauty in Common Things*. The illustrations, by Mrs. J. W. Whymper, of bramble blossoms, furze, beech-leaves, apple-blossom, hazel-nuts, etc., are true and beautiful; the letterpress explanatory of the pictures is inoffensive, but not equal to them. *A Packet of Gift Cards for the New Year*, published by the same Society, also deserves a passing notice, more especially for the painting of a group of red anemones upon one of them. *The Carved Cartoon, a Picture of the Past*, by Austin Clare, is another of the same Society's publications, and is an interesting story, founded upon the life of Grinling Gibbons, the famous wood-carver. Both Pepys and Evelyn mention Gibbons in their diaries, and as he lived in the time of the Plague and the Fire, and was employed by Charles II. in the wood-carving for the interior of St. Paul's, there is plenty of scope for an imaginative mind to group many incidents of those eventful times around the clever young artist, and this has been done with considerable success. The story is graphic and well told. The

episode of the Savoyard boy, accused by the people of being one of the foreigners who brought the plague, and his subsequent devotion to Gibbons who befriended him, are especially pathetic. The conversation of the crowd at various points of the story is, probably, very unlike that which would have taken place in the time of Charles II., but a laudable effort has been made to maintain consistency.

It is not so easy to give praise to *The Great Car, Cotton, Riversdale, Robin the Bold, The Slave-Dealer, The Two Shipmates, Boys and Girls, A Month at Brighton, Pictures from Venice, A Faithful Servant, An Inherited Task*, and *Sardinia*—a series of shilling volumes published by the Christian Knowledge Society. They have no sort of connexion with each other, and their titles give very little idea of their contents. *The Faithful Servant*, for instance, might be chosen from its name as an appropriate present for a young cook, and it is found to be "the Journal of what took place in the Tower of the Temple during the captivity of Louis XVI., King of France, by Jean Baptiste Clery, valet de chambre to his Majesty." *Pictures from Venice* is an exceedingly dull abstract of the history of Venice. *Sardinia* is a little guide book to the island, with a slender thread of story running through it; and we leave one of the characters at the end of it "sleeping beneath the clustering pretty pepper-trees awaiting the Resurrection." *The Inherited Task* is a record of interesting facts about the first establishment of missions in South Africa, which not even the weak style of the writing can quite spoil: but it ends with a remarkable statement about the anatomical structure of bishops:—"Kindness, tact, and true religion are as conspicuous beneath the lawn sleeves of the Bishop of — as they were under the woollen shirt of Guy Hamilton." This venerable Society must produce something better than this series of books if it means to keep a place in the literary world.

Messrs. Sampson Low have brought out a much better series of shilling volumes in "The Rose Library." Mrs. Alcott's admirable stories, *An Old-fashioned Girl, Little Women, Little Women Wedded*, and, best of all, *Little Men*, have for some time been favourites in England, and every one will be glad to welcome them in this cheap and tempting form. *The House on Wheels* will also be popular, and *The Mistress of the Manse*, a new poem by J. S. Holland, deserves to be so. In spite of some crudities, the last-mentioned book shows original power and poetical thought. To say at the end of a long metrical story—that has for its central figure a clergyman's wife, for its subject her devotion to her husband, and for scenery a quiet country parish—that it is not dull, is to say a great deal. Mildred, the heroine, is one of the many women who have to learn the lesson that

"Woman is not undeveloped man,
But diverse"

and the way in which this lesson is taught to her by her life is well told. The account of the part her husband takes in the last American war, and his death, are simple and pathetic.

Messrs. Routledge & Sons are determined not to let our old fairy tales die out. They reproduce them from time to time with praiseworthy industry and attractive skill. This winter we have an extremely pretty volume containing "Goody Two Shoes," "Beauty and the Beast," "The Frog Prince," and "An Alphabet of Old Friends;" also each of these stories separately in shilling numbers, as well as a good book of Nursery Rhymes set to traditional music, with capital pictures. That no one may be neglected and find themselves without a picture-book at Christmas time, we have a sixpenny series of "Mother Hubbard," "Valentine and Orson," "Puss in Boots," and even a threepenny series which is a marvel of cheapness and pretty colouring. Some of this last series appear prettily bound together in a charming

little volume called *Pussy's Picture Book*. In *The Marquis of Carabas, his Picture Book*, the pictures are rather confused, so that little children become bewildered over them. The best of Messrs. Routledge's new shilling picture-books is *Robin's Christmas Song*, illustrating Robert Burns's delightful story of Robin and Jenny Wren; and we are surprised that publishers who can produce anything so charming and graceful as this, should also produce such a coarse book as *Gingerbread*, which we cannot imagine any mother allowing to enter her nursery.

From Messrs. Routledge we have received as well—*The Language of Flowers, or Floral Emblems*, by Robert Tyas, M.A., LL.D., F.R.B.S., which is full of platitudes about flowers, and adds little to our information; *The Temperance Reciter*, which contains much about the average selection of extracts in prose and verse for recitation, many of them of course touching on the subject of total abstinence; *Snow Drop and Wild Rose*—inoffensive collections of stories, but not suitable to young children, as it might be imagined from their titles they were; and *A Year at School*, by Tom Brown. Such a name as this last cannot be passed over without censure; it raises hopes which the contents of the book are far from justifying. F. M. OWEN.

NOTES AND NEWS.

MESSRS. GRIFFIN, the naval booksellers at Portsea, are about to publish an Arctic and Antarctic navy list, containing the names of every naval officer who has served in Arctic Expeditions from 1773 to 1874, the expeditions each served in, with brief biographical notices, and details respecting the sledge-travelling done, books written by, and the after-careers of a large majority. The last has been prepared by Mr. Clements Markham, who served in the Arctic expedition of 1850–51.

LIEUTENANT PAYER, who, it will be remembered by readers of the accounts of recent Arctic Exploration, took part in the three last expeditions, and was Commander of the most recent, is writing a volume describing fully the work of all the three, and what has been now attained by them. It will be published in this country, and by Messrs. Macmillan.

A WORK is preparing for immediate publication, under the sanction of the Committee of Council on Education, containing twenty large photographs of the finest examples of ancient needle point and pillow lace, which were shown at the International Exhibition of 1874. The work is under the superintendence of Mr. Alan Cole, by whom the letterpress is written.

It is announced from Berlin that Prince George of Prussia is engaged in writing a drama, the subject of which is taken from the Old Testament, and that with a view of the better preparing himself for the careful working out of the plan, he has called in the aid of a distinguished Semitic scholar to direct him in regard to the correct exposition of the accessories of the piece.

A NEW journal will shortly be published in London, by M. H. Theeman, under the title of the *Jewish Times*. It will devote a larger portion of its pages to the general news of the day than has hitherto been the case with Jewish journals.

We understand that a new edition of *The Secret of Long Life*, by Mortimer Collins, published anonymously by Messrs. Henry S. King & Co. some three years ago, will shortly be issued.

WE are very glad to hear that Mr. John R. Green's able *History of the English People* is to be revised, enlarged, and published in four volumes octavo, with full references to the authorities for its statements, and justificatory quotations, &c. We hope the enlargements will contain a fuller account of the social and domestic history of our

folk, for which the Early English Text Society, the Rolls Calendars, and Chronicles and Memorials, the works of Mr. J. H. Parker, &c., have produced such valuable materials.

RECENT additions to the Manuscript department of the British Museum include the following:—"Musæi de Herone et Leandro Carmen," 1737. A printed volume, with remarks at the end by Lord Byron, his signature also on the fly-leaf, and note of his having swum from Sestos to Abydos, May 3, 1810. A volume of letters addressed by Professor Finn Magnussen to Sir W. C. Trevelyan, between the years 1822 and 1847. A chronological list of the letters of William Cowper, 1758–1799, by the late John Bruce, F.S.A. Letters of Pastor J. H. Schröter, of Thorshavn, Feröe Islands, 1831–1851, to Sir W. C. Trevelyan. "Foereyinga Saga," Kjöbenhavn, 1832, printed; with "Genealogia Foeröensis," by J. H. Schröten, in MS. A fifteenth century Service Book in Dutch vellum, 12mo. Transcripts of Poems by John Lydgate and others; chiefly by John Stowe, 1558. "Formula spiritualium exercitiorum," oculus religiosorum Jacobi (de Clusa) Carthusiensis, vellum, fifteenth century. "Tractatus Jacobi de Clusa, scilicet, Quaestiones pro religiosus et secularibus; de perfectione religiosorum; de protectu in vita spirituali," fifteenth century.

WE understand that the Right Hon. W. E. Baxter, M.P., has revised for the press the lecture he recently delivered to his constituents on "Free Italy," and that it will shortly be published by Messrs. Cassell, Petter & Galpin.

GUSTAV FREYTAG's new novel is announced by the firm of Messrs. Hirzel, at Leipzig, as ready for publication. It will appear under the title of *Die Brüder vom deutschen Hause*, as an independent work, although it forms the third part of the series "Ahnen."

DR. RICHARD MORRIS's short shilling English Grammar is all in type.

THE Rev. M. Creighton, of Merton College, Oxford, is to write a cheap Primer of Latin Literature for English readers.

WE understand that Mr. Pater's next Shakspeare "study" for the *Fortnightly Review* will be on *Love's Labours Lost*.

GERVINUS's *Commentaries on Shakspeare*—the revised translation by Miss Bunnett, with Mr. Furnivall's Introduction, and Professor Dowden's *Mind and Art of Shakspeare*, are both in the binder's hands, and are promised next week.

MESSRS. GEORGE BELL AND SONS have issued the first volume of their half-crown edition of Singer's *Shakspeare*, and a very handy and pretty volume it is. Unluckily, Mr. Watkiss Lloyd has not sufficiently revised his *Life of the poet*, but has left in it some remnants of the Collier and Cunningham forgeries. However, these are too well known by this time to do much harm. The edition is to be completed in ten monthly volumes, and should secure a large sale.

AN illustrated *édition de luxe* of the Schlegel and Tieck German translation of Shakspeare's collected works has just appeared at Berlin, under the combined editorship of Richard Gosche and Benno Tschischwitz, who have shown great taste and discrimination in the manner in which they have performed their task; and have been careful that the costumes depicted should be kept as far as possible in harmony with the requirements of the period in which the action of the play is cast.

HERR EMIL ZSCHOKKE has published a vindication of his father Heinrich Zschokke's claim to be regarded as the sole author of the well-known *Stunden der Andacht*, the tenth edition of which has just appeared at Aarau, and which had been declared by a reviewer to be principally the composition of the pastor, Victor Keller of Aarau, the contemporary and friend of the elder Zschokke.

MR. FURNIVALL has undertaken to open the Lecture season of the Sunday Shakspeare Society on December 20, at 7 P.M., with a lecture at South Place Institute, Finsbury, on "Shakspeare, the Succession of his Works, and the Growth of his Art." He will also open the series of lectures to the Builders' Foremen and Clerks of Works Institution, with a lecture, on January 13, 1875, on "Geoffrey Chaucer, Poet, Clerk of the Works to King Richard the Second." Mr. Henry B. Wheatley will give the second lecture on February 10, probably on "The Old Timber-Buildings of London."

CANON SIMMONS will add to his edition of *The Lay Folks' Mass Book* for the Early English Text Society, an Appendix, containing (1) the Order of Mass for Trinity Sunday, according to the use of York—from a MS., about A.D. 1425) with an English translation; (2) Authorised Expositions of the Doctrine of the Eucharist, put forth in English, A.D. 1357-1515; (3) *Praeparatio Eucharistiae*, or considerations before receiving the Sacrament of the Altar—from a MS., about A.D. 1400; (4) How a Man should hear his Mass—from the great Vernon MS. in the Bodleian, about A.D. 1375.

MR. N. B. DENNY, editor of the *China Mail* at Hongkong, who was formerly in the Consular Service, has published a *Handbook of the Cantonese Vernacular*.

WE understand that explorations on an extended scale will shortly be commenced in Ceylon with a view to the discovery of the archaeological remains of the island.

THE Report of the Trustees of the Public Library, Museums, and National Gallery of Victoria for the year 1873-4, which has just reached us, renews the previous complaint of the pilfering and mutilation of books, and states that the instances brought under the notice of the library committee abundantly prove the delinquents to be men of education. The number of visitors to the library during the year was 276,125. Four oil paintings were purchased during the year for the National Gallery, viz., *Bamborough Castle*, by A. W. Hunt; *The Travelling Tinker*, by E. Opie; *The Italian Brigands*, by M. Layrand; and *In the Fields*, by B. W. Leader. The first three of these pictures were selected by the board of advice in London. That of *The Italian Brigands* is said to have excited more interest and drawn a larger attendance than any previous purchase. The committee consider themselves fortunate in having secured it, by the good offices of Mr. Herbert, R.A., for the sum of 400l.

A CORRESPONDENT reminds us that in speaking of the map in the Bodleian, which dates from the reign of Edward I., we might have added that the Norwegian poet, Andreas Munch, had written a romance on the story of Margaret, Queen of Scotland. We do not clearly see the relevancy of the suggestion, but are not sorry to have recalled to our memory *Pigen fra Norge*, "The Girl from Norway," one of the prettiest works of a very pretty writer; it would be decidedly interesting to English readers, and if our correspondent is thinking of bringing out a translation, we have no doubt it will be well received. Talking of Andreas Munch, we may mention that a Copenhagen publisher has just brought out a new edition of his *Jesu Billede*, and that a Christiania firm advertises a new collection of his earlier poetical works. As soon as Paludan-Müller's *Tidernes Skifte* is taken off the boards, a new piece of Munch's will be given at the Danish National Theatre. The poet, who has been in a very critical state of health, and obliged to take the baths in Switzerland, has entirely recovered, and is now in Copenhagen.

M. FRANÇOIS LÉNORMANT opened his course of archaeology at the Bibliothèque Nationale on Wednesday last. His subject is the texts and antiquities relating to the Eleusinian Mysteries.

MESSRS. CLARK, of Edinburgh, have sent us vol. i. of Oehler's *Old Testament Theology*, and vol. i. of Delitzsch's *Commentary on the Proverbs*. As a translation, the former is more successful than the latter, though the difficulty of Dr. Delitzsch's style to a great extent excuses the defects of his translator. Both works are eminent specimens of German industry in the collection of facts, and Dr. Delitzsch's is something more. But on this head we need only refer to our own remarks in *ACADEMY*, vol. iv. p. 370. Dr. Oehler has the characteristic merits and defects of what we in England should call liberal orthodoxy. In clearness and consistency, though not in learning or in thoroughness, he is far excelled by Dr. Hermann Schultz in his *Alttestamentliche Theologie* (Frankfurt a. M., 1869).

THE extinction of the *Revue de Théologie*, edited by M. Colani of Strasbourg, was such a terrible loss to culture as well as to theology, that we gladly welcome a new monthly magazine which promises to take up the mantle of the *Revue*. Among the contributors to the first three numbers of *La Libre Recherche* we notice the names of Messieurs Michel Nicolas, Athanase Coquerel fils, Pécaut, Th. Bost; and without being able to point to any articles of supreme excellence, we feel justified in recommending the journal on the ground of the spirit of true Christian tolerance which breathes through it.

THE fourth number of Hilgenfeld's *Zeitschrift* for 1874 contains articles by Gass on the patristic word *oikonomia*, by Holtzmann on the last two chapters of Romans (though a very well-read scholar, Dr. H. omits the valuable articles of Lightfoot and Hort), by Spiegel on the legends of Christ in the New Testament, by Brückner on the Epistle of St. James, by Rönisch on the *Assumptio Moysi*, and by Siegfried on the criticism of Philo. Among the reviews, we need only mention that of Delitzsch's and Lagarde's rival editions of Jerome's version of the Psalter, by Rönisch.

AMONG the Parliamentary papers recently issued we notice:—Reports of the Registrar of Friendly Societies and Trade Unions in England (price 1s. 3d.); The Twenty-Third Report on the District, Criminal, and Private Lunatic Asylums in Ireland (price 1s. 6d.); Reports of the Inspectors of Mines to the Secretary of State for the Home Department (price 5s. 10d.); Reports of Her Majesty's Secretaries of Embassy and Legation on the Manufactures, Commerce, &c., of Various Countries, Part III. (price 11d.); China, No. 6. Commercial Reports from Her Majesty's Consuls in China, 1873 (price 1s.); Returns relating to Civil Services Expenditure in certain years (price 8d.); Papers relating to the Metropolitan Water Supply and Fire Prevention (price 6d.); Accounts of Naval Prize, Bounty, Salvage, and other Money, &c.

THE *Nation* states that Professor William E. Griffis, who spent four or five years in Japan (1870-74) as one of the instructors in the Imperial College at Tokio, and who since his return has been lecturing on "Japan of To-day," is preparing a work upon much the same subject, in which he will explain fully the origin and causes of the recent political changes in that country.

"SOME of our readers," says the same journal, "will be glad to know that Mr. John G. Shea has revived his 'Library of American Linguistics.' He begins the new series by a *Grammar and Dictionary of the Language of the Hidatsa* (or 'Grosventres of the Missouri'), by Washington Matthews, Assistant-Surgeon U.S.A. The Hidatsa, the Mandans, and the Arikaras or 'Rees,' now live together near Fort Berthold, D.T. 'To the philologist,' says Dr. Matthews, 'it is an interesting fact that this trio of savage clans, though now living in the same village, and having been next-door neighbours to each other for more than a hundred years, on terms of peace and intimacy, and to a great extent intermarried,

speak nevertheless totally distinct languages, which show no perceptible inclination to coalesce.' The Hidatsa language is of the Dakota stock, nearly related to that of the Crows (Aubearoke) and less nearly to the Mandan. The Arikaras speak a Pawnee dialect. *Minitari* ('Minnitares') is the Mandan name for the Hidatsa, whom the French call 'Grosventres,' the same name having also been given to another tribe, the Falls Indians of the Saskatchewan, distinct from the Hidatsa in language and origin. Partial vocabularies of the Hidatsa or Minnitare dialect have been published by Say and by the Prince of Neuwied; a larger one, by Dr. F. V. Hayden, in his *Contributions to the Ethnology and Philology of Indian Tribes* (1862). Dr. Matthews, while stationed at Fort Berthold, had excellent opportunities, which he knew how to improve, of acquiring a knowledge of this language, and his grammar and dictionary are among the most valuable of recent contributions to American philology."

WE are indebted to the courtesy of a correspondent for two corrections of the note in our last number on the prizes awarded by the French Academy of Inscriptions. It should have been stated that the second prize only in the competition of national antiquities fell to M. Révoil; the first prize was awarded to M. Allmer for his collection of the ancient and mediæval inscriptions of Vienne in Dauphiné. The name of the winner of the second Gobert prize should have been printed as M. Tuetey.

AT the annual sitting of the Académie des Sciences Morales et Politiques, held at the Institut on the 6th, a paper was read by M. Mignet, the secretary, giving an historic notice of the life and writings of Duke Victor de Broglie, who died in 1870, the eminent politician and doctrinaire, the friend of Royer Collard and Guizot, and son-in-law to Madame de Stael.

IN the *Contemporary Review* Professor Lightfoot begins a very serious and formidable dissection of a well-known book. In his first paper, after pointing out the very reprehensible character of the preposterous rumour that the book was the work of Bishop Thirlwall, he proves in detail that the author is capable of gross and repeated mistakes in translating Greek, Latin and German, and of arguing from the passages as mistranslated; that instead of replying to the arguments of opponents, he says they have not adduced any; that his German authorities by no means always hold the views for which he cites them; and that said authorities are capable of reasoning in a manner which would discredit any Father, a charge which he supports by a choice spicilegium of Tübingen speculation on *Enodia* and *Syntyché*. The First Part of *Supernatural Religion* is dismissed with the observation that the spiritual theism of the conclusion (though untenable from the author's standpoint) destroys the effect of much of his negative criticism. The substance of the Second and Third Parts, treating of the Synoptic Gospels, and of the Fourth, will be dealt with in future papers.

THE conclusion of Professor Tyndall's enquiry into the relation of the atmosphere to fog-signalling, and the general conditions of acoustic transparency, shows that neither rain, snow, fog, nor wind, are necessarily obstacles to the passage of sound, though sounds of different degrees of shrillness are variously affected by them to an extent not yet accounted for. Many of Professor Tyndall's experiments were made in London during the fogs of December and January last, but all the conclusions arrived at were also verified by causing sound-waves to pass through artificial showers and fogs, with precautions against confounding the results of the temperature of the medium with its density. However loaded the air might be with smoke or flocculi, if it was continuous and homogeneous, little or no sound was lost in the passage. The inference is, that

sound-signals may be used without any fear of their proving useless on the very occasions when they are most needed, as has hitherto been assumed. Under the most unfavourable circumstances the Professor believes that the "siren" of the experiments "may certainly be relied on at a distance of two miles; in the great majority of cases it may be relied upon at a distance of three miles, and in the majority of cases to a distance greater than three miles." In the same number Mr. Fitzjames Stephen discusses the somewhat threadbare subject of "Necessary Truth" with Dr. Ward of the *Dublin Review*. He begins by inclining to think that all truths are necessary, and ends with the opinion, which follows naturally enough from the premiss "that the word necessary as applied to truth is unmeaning." In one paragraph he makes an ingenious controversial point against his opponent who, by assenting to the mystery of transubstantiation, is committed to the belief that the same body can be in two places at the same time, though he denies that omnipotence itself could make a triangle quadrilateral. Mr. Stephen supposes a figure with two ordinary straight lines forming one of its angles, while a straight body, possessing the power of being in two places at once, would form three other angles and one side! Apart from verbal criticism, and a recognition of the advantage derived by mathematical science from the simplicity and adequacy of its primary conceptions, the author leaves the subject very much where he found it, perhaps from an insufficient perception of the distinction which the metaphysical blundering of his antagonist rests upon and exaggerates. The truth "I am writing at a particular time and place with black ink on blue paper" is, in one way, eternal and immutable, but I am much more liable to forget it, and other people to doubt it, though the fact itself was necessarily conditioned from the beginning of time, than a child is to overlook the geometrical truth that it saves distance to "cut a corner." The marvel would be if the mind did not spontaneously distinguish isolated, successive experiences from the perception, capable of being renewed at will, of constant properties in nature.

THE *Fortnightly* contains a reprint of Professor Clifford's recently delivered lecture on "Body and Mind," the beginning of which is an admirable example of popular exposition, though in one or two cases, perhaps, the sprightliness of tone, which serves so well to keep an audience awake, might with advantage have been sobered under the less trying condition of print. After summing up some of the accepted conclusions of scientific psychology, and especially noting the importance of the belief, not only that some change in the matter of the brain is the invariable antecedent of a fresh state of consciousness, but also that some other material change is the invariable concomitant of the same state, the writer ingeniously argues that unless the actions of men follow automatically from their characters, they (i.e. their characters) cannot be held responsible for the result. It is not quite clear to what extent this little moral paradox is meant seriously, for the character, scientifically speaking, can only mean the habitual disposition of the nerves of the brain to vibrate in one way rather than another, and all the efficient antecedents of the actual vibrations can only be clearly estimated on their material side. There is no difficulty in conceiving one change in the matter of the brain as the cause of another immediately ensuing change, but when this view is accepted it is scarcely natural to regard the consciousness which attends the first change as the cause even of the consciousness of the second, much less as the cause of its actual occurrence, as the ordinary doctrine of responsibility would require. The "conclusion of the whole matter" is rather hinted at than developed, but it is to lie in an extension of Helmholtz's theory of sensation, according to which the modifications of the percipient brain are really analogous in kind to the variations in the

outside things perceived. The next article, "On Auvergne," by Professor Cliffe Leslie, gives some very interesting information as to the different distribution of landed property in the valley of Limagne and the mountainous districts of the Puy-de-Dôme. In the plain inheritances are subdivided, according to the Code; but the population declines, owing to the peasant proprietors' dread of a family large enough to make subdivision ruinous. In the mountains family pride and religious feeling are still so strong, that the younger sons emigrate or enter the priesthood, whilst the daughters either take religious vows or renounce their share of the inheritance on marrying, so that the paternal dwelling passes to a single heir. In Mr. J. A. Symonds' interesting paper on the Blank Verse of Milton, sufficient stress is hardly laid upon the fact, that of the great poets of the English Renaissance who used that metre, Milton was the only one who knew Italian poetry at first hand, which is important because Italian poetry is further from scanning than any other poetry that reads musically. Instead of breaking up and resolving the regular Iambic quaternarius of Marlowe, like the dramatists, he adopted the free hendecasyllabic of the Italians, with an occasional glance in the direction of prosody.

THE mineral baths of Auvergne which Mr. Leslie mentions as constituting a third social and economic region, are also, as it chanced, made the subject of an attractive description in the *Cornhill*. The same magazine has an article of "Bennet Langton," the *raison d'être* of which defies conjecture; it is simply a string of passages from Boswell and equally well-known sources about the man who had read Clenardus. The "Thoughts of a Country Critic" on the school of literature and art which may be recognised by a disposition to admire Botticelli with even more laborious fervour than Lionardo—are not particularly new or brilliant, but the conclusion is as much to the purpose as most criticism. He says:—

"These artists have taught me so much, and I owe them so much thanks for what they have taught me, that I am almost converted to believe that they have the key of the future; and certainly no other school can do more than fumble at the door. But they want faith and hope—and so with all their sense of beauty and all their technical skill, they fail in power of creation. Hopeless is thankless; and thankless art has no future. They remain fruitless because faithless; Atys-priests of beauty, impotent to add to the life of art; because they believe in death rather than in life."

The article on the "Popular Poetry of the North Italian Dialects" contains, besides some very weird and rapid popular ballads, one or two specimens of the poetry of Brofferio, the leading patriotic orator of the Piedmontese parliament, which bear little resemblance either to Heine or Béranger, whom we are told he imitated with such success as was possible in the rugged dialect of his country.

IN *Fraser*, F. R. C., in a paper headed "The Ethics of Jesus Christ," points out that the sayings in the Sermon on the Mount, where He seems to most readers to contrast His teaching with that of His predecessors, may be explained as extensions of the Rabbinical principle of "fencing the law," and that Matt. xii. 5, "I have ye not read in the law, how that on the Sabbath day the priests in the Temple profane the Sabbath, and are blameless?" almost proves that part of the Mischnah on the Sabbath must have been written down already, as there is no clearly relevant passage in the Pentateuch.

W. L. Watts describes the first attempt to explore Vatna Jökull. It covers an area of 5,000 square miles, and is represented as a mountainous tract surrounded by a rolling plateau containing numerous volcanoes, one of which (if not more), upon the north, appears to be in a state of pretty constant activity, while many others in all proba-

bility are paroxysmal, most likely exhibiting all the phenomena characteristic of "bottled up volcanoes." Mr. Watts believes he has reached the centre of this tract, and wishes to renew his explorations next year in company with three Englishmen and four Icelanders. It appears that mountaineering in Iceland will not compare as a gymnastic exercise with mountaineering in Switzerland, while the hardships are immensely greater.

In *Macmillan* Mr. Fleay suggests that the description of the Sack of Troy in *Hamlet* is Shakspeare's version of the scene which Nash supplied in Marlowe's tragedy of *Dido*, intended to show that he could have done better than Nash. E. S. Ffoulkes, with much more heat than is favourable to clearness, describes an ancient MS. of the fifth century in the Bodleian, containing the "Prisca versio" of the Nicene and other canons, which was already ancient in the time of Dionysius Exiguus, and once belonged to Justellus, a Calvinist canonist whom De Marca sometimes found it convenient to compliment; seven leaves of this have been cut out and four replaced. When the younger Justellus and Voel edited it, they alleged in their preface, under pressure from De Marca, that five of the leaves had been lost, and two were replaced (having previously been at the end). Baluze and De Marca state that Justellus in his youth had cut out the Sardican canons, because coming directly after the Nicene, they told too much in favour of the Pope: they also state that the Nicene and Sardican canons were consecutively numbered, in which case the celebrated citation of Zosimus would certainly have been made in good faith; but even the present state of the MS. shows that this cannot have been so. Mr. Ffoulkes is more than half inclined to think that the MS. was mutilated in the interests of Ultramontaniam in order to make the Nicene and Sardican canons look continuous to a careless reader. The question is of less importance than Mr. Ffoulkes thinks, because if Zosimus was misled by a slovenly copy of the canons of Nice and Sardica, either Caelestin or Innocent or Leo might have had a careful one made, and then the other would have left no trace.

IN *Good Words* a grandnephew of Bishop Horsley gives a sketch of his life, and two curious letters to his stepbrother. The first is on education, and dated 1770, which is remarkably utilitarian in spirit, and contains a scheme of reading such as it was possible to trace eleven years before the first volume of Gibbon appeared; in a fragment of another, dated 1806, he commits himself to the following propositions: "Bonaparte will remain master of Europe, at least of all the southern part. He will settle a considerable body of Jews in Palestine, which will open a door for him to the conquest of the East, as far as the Euphrates. He will then set himself up for the Messiah, and a furious persecution will take place, in which his friends in Palestine will at first be his principal instruments, but will at last turn their weapons towards his destruction."

THE second number of the *Deutsche Rundschau* is an improvement on the first. Heyse's little story "Nerina" is a masterpiece. It professes to be an episode in the tragic life of the poet Leopardi, and contains some exquisite translations of his poems. The contrast between what is and what might be in life is powerfully drawn. A poet who can be so great in small things should aim higher than Heyse does. Lasker's essay on "Talent and Education" is thoughtful and well written, though occasionally a little prosy. If everything that could be spared had been mercilessly cut out, the paper would have greatly gained in strength. Professor Hüffer publishes some letters of Heine's, written when he was at school and university. All that comes from Heine's pen is attractive, though the boy himself must have been insufferable. Hellwald's paper on "Polar Expeditions" will be read with interest

at the present moment both in Germany and in England. The literary, musical, and political surveys at the end of the Review require more force and character.

In the *Revue des Deux Mondes* for November 15, M. Gaston Boissier has an ingenious review of the decent parts of Petronius, whose object he believes was to amuse Nero, who liked to explore the *demi-monde*. In the number for December 1, M. Anatole Leroy Beaulieu calls attention to the unsatisfactory condition of French cathedrals, which have no funds available for current repairs, while the state from time to time decrees grandiose and sometimes reckless restorations (e.g., at Evreux the transitional vaulting in the nave with the flat bands of the ribs is to be replaced by commonplace Gothic), carried out to please the neighbourhood and the architects, who apparently are more ambitious and less conservative than their English brethren. M. Ernest Desjardin's article on Trajan describes his system of "alimentation"—by advancing sums from his exchequer to landed proprietors at low interest, which interest was to be expended in bringing up poor children—rather more clearly than Merivale. The only other original point in the paper is that the writer endorses M. Aubé's rather arbitrary suspicions of Pliny's ninety-seventh letter.

THE last instalment of "A Rebel's Recollections," by George Cary Eggleston, in the *Atlantic Monthly* for December, is one of the most interesting: it describes the superstitious endurance of Lee's army during the months of the war when they went on hoping against hope; the co-operation of the defeated troops with the Federal army in the preservation of order after the final collapse; and the gentleness and loyalty of the negroes to their former masters both after the struggle had become hopeless, and after it was over. Edgar Fawcett's article on the Poetry of T. B. Aldrich is very instructive, because of the ingenuity with which the writer manages to avoid the obvious statement that Mr. Aldrich writes very well, and likes writing, and has nothing to write about. Mr. Longfellow contributes some very finished clear and delicate stanzas on Cadenarbia, on the Lake of Como, that remind us a little of Mr. Tennyson's manner of thirty or forty years ago.

THE appeal which is now being made for votes to gain admission into the Asylum for Idiots, near Colchester, of "Frederick William De Foe, aged eight, only son of ten children of J. W. De Foe, of Chelmsford, great-great-grandson of Daniel De Foe," brings back to our recollection another episode in the history of the same family, which is well worth recounting under the present circumstances. Mr. Forster, in his *Life of Goldsmith*, ed. 1854, called attention to the fact that there was then living in Kennington, in deep though uncomplaining poverty, James De Foe, aged seventy-seven, the great-grandson of the author of *Robinson Crusoe*. Upon the publication of this, Walter Savage Landor addressed an eloquent letter to the *Times*, calling upon every schoolboy, and every man in England who had been one, to give his penny at once to save the descendant he had left "a Crusoe without a Friday, in an island to him a desert." Two passages of this remarkable letter may be quoted at length:—

"Let our novelists, now the glory of our literature, remember their elder brother Daniel, and calculate (if indeed the debt is calculable) what they owe him.

"Let our historians ask themselves if no tribute is due, in long arrears, to the representative of him who wrote the *History of the Plague in London*. What ought to live will live, what ought to perish will perish. Marble is but a wretched prop at best. Defoe wants no statue, and is far beyond all other want. Alas, there is one behind who is not so. Let all contribute one penny for one year; poor James has lived seventy-seven, and his dim eyes cannot look far into another."

With the aid of Mr. Forster, Mr. Charles Knight and Mr. Dickens, some subscriptions were col-

lected, and between January 1854, and the middle of May, 1857, when the old man died, about 200*l.* was paid in small sums, and a small balance handed over to his daughters at his death. In an interesting note to Mr. Forster's last edition of his essay on De Foe, may be read further particulars of this charitable proceeding. De Foe's house at Stoke Newington still stands (unless very recently improved off the face of the earth). Its situation is best described as being on the south side of Church Street, a little to the east of Lordship Lane, having about four acres of ground attached, bounded on the west by a narrow footway, once (if not still) called Cut-throat Lane.

NOTES OF TRAVEL.

THE preparations for the approaching expedition to the North Pole, which, we may observe, should be termed the Polar and not the Arctic Expedition, are in active progress. We learn that the committee now sitting at the Admiralty, to whom the entire organisation of the expedition has been entrusted, have recommended the purchase of two ships. One is the *Bloodhound*, of 600 tons, a Dundee ship originally built at Greenock, and the other the *Alert*, a slightly larger vessel, formerly a man-of-war. Both these vessels, it is calculated, being fitted with compound engines, can carry a supply of coal sufficient to steam for twenty days at eight knots an hour. They will indeed be fortunate should they find sufficient open water to exhaust their steaming powers. They will be manned by crews of some sixty men, all told: and we hear that so numerous are the volunteers, that there would be but little difficulty in manning the ships entirely with officers. As has already been announced, Captain Nares, of the *Challenger*, has accepted the chief command; we are now informed that Captain Albert Markham, of H.M.S. *Sultan*, has been telegraphed for to Lisbon; he will probably serve as second in the senior ship. Few of our readers will have forgotten the late exertions in Arctic exploration of this most brave and efficient officer. It is not probable that the expedition will sail before the beginning of June at the earliest, time being thus allowed for the ice to break up and clear out of Smith's Sound as well as from Baffin's Bay. As has been already announced, the attempt to reach the Pole will be by the way of Smith's Sound. The late American expedition penetrated further to the north in this direction than any previous one, but the extent of the discoveries they claim to have made will be probably much circumscribed when subjected to the test of searching scientific examination. In any case, it must be admitted that there is no trustworthy information concerning the region to the north of lat. 82°, or, more properly speaking, lat. 81° 30' N., where the *Polaris* wintered. From 82° N., as our readers know, it is but 8° to the Pole; and it is in this field that immortality now awaits our gallant explorers. We believe that the plan of operations will be somewhat as follows. After forming a dépôt on the coast near the entrance of Smith's Sound, the two ships should sail in company to some position yet to be decided upon, up that remarkable route to the Polar Sea, where one of the vessels will be left, the other making the best of her way into the unknown region lying beyond.

We have no doubt that, guided by the long experience acquired by the officers composing the Arctic committee, careful instructions will be given to the leader of the Polar Expedition to ensure his always keeping in communication with the second ship, and she again with her rear or base, the dépôt at the entrance of Smith's Sound. Where the leader may reach, or what he may succeed in accomplishing, is of course purely problematical, but assuming that both ships should reach the position attained by the American Expedition under Hall, there can be no doubt that the British sledgeparties in 1876, organised on the system which yielded

such splendid results in the years 1850, '52, '53, '54, in the perfect exploration of the great archipelago of lands lying between Behring's Strait and Baffin's Bay, cannot fail to add largely to the geographical knowledge of an area round the Pole which is at present a blank in our maps and charts; whilst the ships and those in them, wherever they may winter, will collect most interesting scientific data of every description. The Admiralty, we are told, are determined that nothing should be left undone on their part to ensure success. The navy of England already shows how gratefully it acknowledges the opportunity given by the country for keeping our colours to the fore in maritime discovery, and we doubt not the result will more than justify every expense incurred.

FROM a paper recently read by the Count Foucher de Cariel before the Paris Geographical Society, it appears that Leibnitz was an enthusiast in various branches of science. In a memorandum laid before Peter the Great, he urged the desirability of acquiring a complete knowledge of the different tongues spoken by the numerous nationalities subject to Russia, of employing missions as civilising agencies, of instituting magnetical observations for the benefit of navigation, of enlarging our knowledge of astronomy by constant observations, and of geography by despatching an expedition to the North Pole, of making collections in every branch of natural history; and lastly, of benefiting Russia by the translation into her language of the best foreign encyclopædias. One of his chief ideas, however, was the establishment of easy communication with China, which he described as the Eastern Europe. All these objects still continue at the present day to occupy our attention, and their importance is now fully recognised. But it is not generally known that Leibnitz led the way to a remarkable geographical feat, the discovery of Behring Straits. He had often insisted on the necessity of ascertaining the eastern boundaries of Asia, and his curiosity had been whetted by the obscure stories circulated by fur-hunters respecting a mysterious ice cape in those distant regions. Two expeditions were despatched at Leibnitz's instance to solve the question, but their achievements were unfortunately indecisive. It was not till 1725—nine years after the death of the philosopher—that the Dane Behring was sent by the Czar to investigate the problem. The Paris Académie des Sciences claims to have suggested the step, but there is little doubt, Count Foucher de Cariel thinks, that Leibnitz's labours had really cleared the way.

A NEW pile dwelling has been lately discovered at the Swiss hamlet of Vingelz, not far from Biel, where, at the depth of only about three or four feet below the surface, a platform has been found resting upon piles, and composed of beams nearly a foot thick. In consequence of the density of the mud in which they have been immersed they have been extremely well preserved, and although permeated by water the woody fibres and the stratification of the consecutive layers, with the rings and nodes on the stem, plainly show that the planks are of oak. Beside these there are, however, some reddish-looking pieces of wood whose character is not quite so clearly indicated, although they are probably of cherry wood. About fifty paces nearer Biel an interesting discovery was made last winter on the banks of the lake of a well-preserved boat, about 40 feet in length and 3 feet in width, which was enclosed in a deposit of marl, although the interior and the form of the sides could be traced through the blackened coating of mud. In form and mode of construction it is precisely like other remains of the kind which have been recovered in different parts of Switzerland from their long burial, and it enables us to form a correct idea of the degree of completeness to which the art of boat-building had been carried in Switzerland at the period of the Roman domination to which these and similar objects of lacustrine industry must be referred.

THROUGH the low state of the waters of the Rhine, the ruins of the church of Halen, near Rubrort, have recently been exposed, which, together with a portion of the adjoining hamlet, had been buried under the waters for more than 300 years. This church, which was one of the most ancient in the entire district, is described in a letter, dated 1571, and addressed to the rector of the Gymnasium at Duisburg by Count Hermann Von Nüenar and Mörs, as a strong, handsome, well-built edifice. The Count suggests in his letter that, in consequence of the danger from inundation to which the building was then exposed, it should be taken down, stone by stone, and rebuilt at Homberg; but the idea that the church served as a breakwater for the neighbouring hamlets of Baerl and Binsheim led to the rejection of his suggestion, and soon afterwards the entire area on which it stood was carried away by the force of the stream, and wholly submerged. The Count then granted the chapel of the Minorite Nunnery at Homberg, which he had acquired by purchase on its dissolution, to the Reformed congregation of the Halen church, who subsequently conducted their services in that building.

THE PALESTINE EXPLORATION FUND.

A LARGE number of new identifications in the Hill Country of Judah have been recently proposed by Lieutenant Conder. The principal of these are the following:—

Choziba, a place mentioned once (1 Chron. iv. 22) and hitherto supposed to have been the same as Chezib, or Achzib. Lieutenant Conder proposes Khirbet Kueizibeh, a ruin north of Halhul. The walls of the old houses, probably of Roman date, are still standing to the height of 8 or 10 feet, the masonry being a fine ashlar, with stones some 3 feet in height by 3 to 4 feet long. Each house seems to have formed a small fortress in itself, being of great strength, and a fort dominates the town.

Maarath.—This place is mentioned between Gedor (Jedur) and Beth Anoth (Beit Ainun). The name is almost identical with the Arabic *Mogharah* (a cave) and near the last-named place is an ancient site at the head of a valley which at this point, and at no other, bears the name of Wady El Moghair. The site itself, like that of Ai, is now only distinguishable by a clump of olives.

Arab.—This name belongs to a group of cities surrounding Hebron. East of that place has been found a ruin called Khirbet el 'Arabiye. The *aleph* has been replaced by the stronger form of *ain*, but a similar change is remarked in the undoubted identification of 'Askelan with Ascalon.

Zanoah.—There were two towns of this name. That in the lot of Judah was identified by Robinson with Zanuta, which belongs, however, to quite another group of towns. Zanoah lay between Juttah and Cain. Immediately west of Khirbet Yekin, probably the ancient Cain, Lieutenant Conder has found a site called Khirbet Sanut (with the *aleph*) which seems to agree better with the Biblical position.

The Forest of Harith and the Wood of Ziph.—Lieutenant Conder, after calling attention to the absence of any forests or trees in the district at present, argues, from the character and geological formation of the country, that at no time could there have been any wood at all. Further, while the Authorised Version speaks of the *Forest of Harith* and the *Wood of Ziph*, the Septuagint and Josephus both agree in calling them the *city of Harith* and the *New Place* (*ἡ γὰρ καὶνὴ*) of Ziph. Now he has discovered near Keilah, in whose vicinity Harith, city or forest, undoubtedly lay, a site called Kharas, a name embodying all the essential letters of Harith (Kharith). Also about a mile south of Tell Zif is a ruin called Khirbet Khorreisa, in which Lieutenant Conder proposes to see the Hebrew *Choresa* of Zif.

The Rock of Maon.—The modern Tell Main is undoubtedly Maon, but Lieutenant Conder suggests that the Rock of Maon, "down" into which David went, is the Wady el War, the Valley of Rocks, a place exactly fulfilling all the requirements of the episode connected with the "Rock of Maon."

The Hill of Hachilah.—Lieutenant Conder proposes for this site a high hill bounded by deep valleys north and south, on which now stands the ruin of Yekin. Between *Hakin* and *Hakila* there is no great difference, and the change from *n* to *l* is observed in the Arabic word *Sinail* (an earthquake) written equally *Silasil*.

Cliff of Ziz.—Near Yutta is a large and important ruin called Khirbet 'Aziz. Since the *ain* and *he* are interchangeable, we have here the word *Haziz*. There are topographical difficulties connected with the identification of this place with the cliff of Ziz, especially in its distance from Engedi, and the fact that the valleys east of it do not run to the Red Sea, but to the Mediterranean; but the similarity of names is remarkable, and Lieutenant Conder has observed that the Wady Khubara, the main valley just south of Engedi, runs westward directly towards this ruin, to which the ascent from the Dead Sea shore would be along this great water-course.

The Limits of the Levitical Cities.—Among the sites in the country south of Hebron are those of two Levitical cities, Yutta (Juttah) and Semua (Eshtemoh). In the hopes of finding something here analogous to the discovery of M. Ganneau at Gezer, a careful examination was made at about the Levitical distance from the centres of the towns. It will be remembered that in the case of Gezer the cardinal points were the angles of the square. Curiously, both for Juttah and Eshtemoh, the cardinal points are hill-tops. But in neither case could any inscription be found. Near the latter site, however, at a distance of 3,000 cubits of sixteen inches, and a little east of north, was found a stone called *Hajr el Sakhain*, now forming a boundary between the lands of Yutta and those of Semua. Three similar stones were also found lying nearly west of the first, also now used as modern boundary marks. It is not as yet clear that these stones are ancient, or *in situ*, or that they were the Levitical boundaries at all; but if they prove to be so, we should have the singular fact that the boundaries of Eshtemoh, when staked out, formed a square, of which the sides ran north, south, east, and west respectively, while those of Gezer had their angles at the cardinal points.

W. BESANT.

WALTER SAVAGE LANDOR.

Catulle frater, ut velim comes tibi
Remota per vireta, per cavum nemus
Secumque Ditis haud inhospiti specus,
Pedem referre, trans aquam Stygis ducem
Secutus unum et unicum, Catulle, te,
Ut ora vatis optimi reviserem,
Tui meique vatis ora, quem scio
Venustiore adisse vel tuo lacum,
Benigniora semper arva vel tuis,
Ubi serenus accipit suos deus,
Tegitque myrtus implicata laurea,
Manuque mulcet halituque consecrat
Fovetque blanda mors amabili sinu,
Et ore fama fervido colit viros
Alitque qualis unus ille par tibi
Britannus unicusque in orbe praestitit
Amicus ille noster, ille ceteris
Poeta major, omnibusque floribus
Priore Landor inclytum rosâ caput
Revinxit extulitque, quam tuâ manu
Recepit ac refovit integram suâ.

ALGERNON CHARLES SWINBURNE.

JOHN DOUGLAS, BISHOP OF SALISBURY, AND HIS CORRESPONDENTS.

(Concluded from page 610.)

ON July 15, 1750, Douglas records that he preached before the University of Oxford, and going to London in the autumn he made his appearance as an author in November, when he published his *Vindication of Milton* from Lander's charge of plagiarism. In this year the vicarage of High Ercall, in Shropshire, was given him by his patron, upon which he vacated Eaton Constantine. The obligation he lay under to perform certain clerical duties in connexion with these benefices seems to have oppressed him but lightly, for we are told in the short memoir written by his son that he "resided only occasionally on his livings; and, at the desire of Lord Bath, took a house in a street near Bath House, where he passed the winter months." In the summer he generally accompanied the same nobleman in his excursions to Tunbridge, Cheltenham, Shrewsbury, and Bath, and in his visits to the Duke of Cleveland, Lord Lyttleton, Sir Henry Bedingfield, and others.

On Sept. 14, 1752, Douglas was married at Preston Church, near Wellington, to "Miss Dorothy Pershowse, sister of Richard Pershowse, Esq., of Reynold's Hall, a good old Staffordshire family." Having resolved to live in London, he prepared a house in Bolton Street, where his wife arrived on November 30; but a cold which she caught in travelling threw her into a fever, and she died on December 16, aged twenty-three.

For some years after this Douglas devoted himself to increasing his influence and establishing his reputation by the production of a variety of pamphlets on the events of the day, hardly any of which possess the slightest interest at the present moment. Some of these, however, he found it to his interest not to acknowledge. In 1759 he published *The Conduct of a late Noble Commander candidly Considered*, in defence of Lord George Sackville. No one, says his son, ever knew that he wrote this, except Millar the bookseller, to whom he made a present of the copy. About the same time he wrote and published *A Letter to Two Great Men on the Approach of Peace*, a pamphlet which excited great attention, and always passed for having been written by Lord Bath. We now meet among Douglas's correspondents George Colman the elder, who discourses from Shrewsbury, July 29, 1760, in the following strain:—

"Dear Dr

Great inquiries are made after you in this town from several people. They say you promised them a visit this summer, & seem a good deal disappointed when I tell them I don't imagine you will be here. How do you go on at Tunbridge? Is there any wit stirring? any lively verses so very good that the Pantles immediately pronounce they must be Dr Douglas's *aut Erasmus, aut Diabolus*. Pray make my comp^a to Mr Porter's neck & Dr Bartlemy's nose. I hope you are wiser than you use to be, & do not trifle with the waters. They are Balsam to my Lord, but poison to you. The best medicine you could take at Tunbridge would be a rich wife. But beware of Counterfeits, for such are abroad," &c.

Douglas himself writes from London to "Lord Pulteney with the army at Belle-isle":—

"Nov. 18, 1761.

"We hear that the Duke of Bedford is to be Privy Seal; & by all accounts, Lord Bute is very well with Mr Fox. George Greenville is the Principal Manager of the House of Commons; and Mr Pitt, with all his Popularity in the city, will never, it is supposed, be able to reinstate himself in his Influence in the House or in his Place in the Cabinet."

Boswell has duly recorded that Dr. Douglas and the "Rev. Mr Aldrich" were concerned with Dr. Johnson in unmasking the celebrated imposture of the Cock Lane Ghost. If any confirmation of this were needed we have it in the following little note:—

"Rev^d Sr

"The appointment for y^r examination stands as it did when I saw you last, viz. between 8 & 9 this

evening. Mr Johnson was applied to by a Friend of mine soon after you left him, & promised to be with us; sh^d be glad, if convenient, you'd shew him y^e way hither. Mr Oakes, of Dr Macauley's Recommendation, I sh^d be glad to have here on y^e occasion; & think it w^d do honour to y^e list of Examiners, to have Dr Macauley with us.

"I am, &c.,

"STK. ALDRICH.

"St John's Square. Monday noon."

This note is endorsed—

"Mr Aldrich, Feb^r 1, 1762—about Cock Lane Ghost—examination at his House."

In his return from Shrewsbury with Lord Bath in the summer of 1762, they passed a week at Hagley, Lord Lyttelton's, who, writes Douglas, "by this time had forgiven or seemed to forget my having writ against his friend Bower. N.B. The true reason of Lord Lyttelton's close attachment to Bower, after his detection was that he owed him a large sum of money, which Bower had lent his Patron. This I learnt from undoubted evidence."

Archibald Bower, who wrote the Lives of the Popes, and whose plagiarisms from Tillemont and secret connexions with the Jesuits were exposed by Douglas, is of course here referred to.

Here follow a few other scraps from the future bishop's very meagre personal memoranda:—

"In Dec^r of that year—on the day the preliminaries of peace were to be considered in Parliament I wrote what was called *Sentiments of a Frenchman* printed on a sheet which was delivered *gratis* in the Lobby & Court of Requests.

"May & June, 1767. At the desire of L^d Bute wrote several papers in y^e Public Advertiser in defence of the grant to St James Lowther. They had a very remarkable effect.

"1770. On the Duke of Grafton's resigning in the spring, I wrote several papers in the Public Advertiser to encourage Lord North to go in, signed Tacitus.

"1771. I made a push to exchange my Canonry of Windsor for a Residuaryship of St. Paul's, vacant by Bp. Egerton's going to Durham. Lord North to whom I had applied thro' Mr Jenkinson intended this for me; but the Archbishop got it for the Bp. of Lincoln."

We should be glad to have met with a few allusions to his much more famous fellow contributor to the *Public Advertiser*, Junius; but neither here nor in any portion of the correspondence is there the slightest reference to him.

A sufficient testimony to the sociable qualities of Douglas is afforded us by the following little note, endorsed "Mr. Garrick, Jan^r 14, 1773":—

"Dear D^r

"half a dozen friends, pack'd together in haste, will meet at y^e Adelphi at five to-day to eat sour Krout & a haunch of Venison—will you make one?"

"Y^e ever

"D. GARRICK.

"I intended to call yesterday."

Of a different nature is this extract from a letter of the Scotch divine, Alexander Carlyle, who writes from Musselburgh, March 11, 1773:—

"You may believe that the success of John Home's play gives his friends here the greatest pleasure. We were afraid that it would have cost him to die, before he could receive his full Fame—now he is master of the stage. His success proves too how little Gall there is in John Bull's fat body; and that Patriotism, I mean the mock Patriotism that consisted chiefly in hatred to Lord Bute and the Scottish is now dead and buried.

"Lord Monboddo's Book [*Origin and Progress of Language*] will amuse the literary world as much with you as it does with us. David Hume said a droll thing about it t'other day. 'In those days,' said he, 'that Burnet describes, if one had gone to visit a young lady of a morning, instead of receiving you with a smile, she would only have wag'd her tail. Several Ladys were present, but David's French ease carried him thro'."

There is little of interest to record of the latter life of Douglas. His chief literary labours were the editing of Cook's Voyages, and the Hardwicke State Papers. He rose rapidly from one ecclesiastical preferment to another: in September, 1787

was appointed Bishop of Carlisle, the following year Dean of Windsor, and in 1791 he was translated to the see of Salisbury. Though there is nothing to be found among his papers which shows him in the least degree impressed with the sacred nature of his calling, we have abundant proofs in them of the esteem in which he was held by the more intellectual portion of his contemporaries. Among his correspondents figure Burke, Gibbon, Hume, Robertson, James Bruce the traveller, Paley, and others not yet forgotten. From the vast bulk of their letters we have selected two of the most remarkable wherewith to conclude our notice of this interesting collection.

"Sir

"Will you permit a Man of letters, who has some reason to complain of the late Bishop of Bristol to address himself to one of the most respectable of his surviving friends?

"Most assuredly I do not complain of the harsh sentence which Dr Newton has passed on the style & composition of my history. Opinions should be free, they must be various, and I am more flattered by the perseverance of the good old man, than I can possibly be offended with his taste. His Anecdote of the disgust of two Right Reverend Critics I never knew or had totally forgotten, and can only rejoice for Mr. Cadell's sake that their example has not been very contagious. But Dr Newton's assurance that my testimonies are not to be depended upon would give me more serious concern, if I were not satisfied that the Bishop has too credulously listened to bold assertions, and partial reports, and if in the instance which he produces he were not evidently mistaken.

"His Lordship (in his Life, p. 130) has taken notice of one of my testimonies (vol. iii. p. 99) from Burnet *de Statu Mortuorum* (p. 36, 84, 91, &c.) and without questioning the truth of the quotation he charges me (or rather the passage which I have alledged) with supposing that Dr Burnet believed in the *sleep* of souls, which in another place he expressly disclaims. If that ingenious author had been guilty of a contradiction, can I be justly made responsible for it? But the contradiction is only apparent, & entirely proceeds from the Bishop's overlooking two essential words which I had cautiously inserted '*sleep or repose*.' Dr Burnet rejected the former, he maintained the latter; it was his opinion that human souls retained, in a separate state, the consciousness of their existence, but that these *incorporeal* substances are incapable of action, deprived of the organs of sense, and excluded from all communication with external objects. Perhaps this sentiment is neither orthodox nor intelligible, but it appeared curious in itself, and very apposite to my particular purpose.

"I have taken the liberty of sending you Burnet's book, and if on examination you should think me in the right, I trust, from your candour, that you will do me justice in literary, or even *clerical* conversation, where the Bishop's criticism may chance to be mentioned.

"I am with great regard

"Your obedient humble Servant

"E. GIBBON.

"Bentinck Street: May 9th, 1782."

"My Lord,

"I am a little uncertain what to do, & I wish to govern myself by your Lordship's advice. I publish in a day or two a defence of myself in consequence of some Transactions in Parliament. When I first ventured into the world the Book which gave occasion to that unpleasant dispute, I did not presume it to be worthy of being offered to the King. But as his Majesty has been pleased to receive so slight an endeavour for his Majesties service with a degree of Benignity & condescension beyond my Merits or hopes, I began to imagine that I might be wanting to myself, if I did not offer, as the only mark in my power to give of my gratitude and humble duty, a second publication which aims to reinforce the principle which has been so graciously received in the first. However, I am totally at a loss about the manner of proceeding, & particularly whether a publication without the name of the author, though he makes no secret of his writing, can with decorum be presented. If in your Lordship's opinion it may, as there is nothing official in the proceeding, I shall beg to lay a copy of it at his Majesties feet. The manner of handling the subject is equal to my powers, but far below my wishes; But I am sure, that the sentiments

which it contains are such, as tend to connect the rights of the Crown with those of the subject, & to secure the stability of both. I think at least that I have shown, beyond a dispute, that my sentiments are those of the rational Whiggs who settled the succession, upon the antient principles of the constitution, in the House of Hanover.

"A worthy friend of mine at Paris writes me an account of the condition of the Queen of France which makes it probable that the life of that persecuted woman will not be long. I should be sorry that any unhappy person should lose the chance of better days. But I fear her death will have a bad effect on the general Cause of Europe; as it will probably take away one inducement from the Emperor to exert himself. People talk of the mischiefs of precipitation, there are mischiefs also in delay; & they are the worst, for they may arise from want of foresight. My friend's words in his letter of the 14th of last July [the glorious Æra] are these 'Oh! Monsieur! que des pages à remplir sur ces Evenemens! Notre infortunée Reine est changée à ne la pas reconnoître. Ses cheveux sont devenus blancs comme ceux d'un Vieillard, et cet accident a été subit. On trouble son sommeil pour voir si elle est en personne dans son lit. On fait de même au Roi. Une seule porte conduit dans le Chateau. Personne n'y entre sans subir un examen indécent.' What a lesson to the great & the little! How soon they pass from the state we admire and envy to that the most cruel must pity! I find I am preaching to a Bishop—but there are things & events that now preach, & not either clergy or laity. Adieu—these things make me melancholy. I have many thoughts on the general state of things, but they are not worthy to trouble you about them.

"I am ever with a very affectionate & respectful attachment

"My dear Lord

"Your most faithful

& Obed^t humble Serv^t

"EDM. BURKE.

"Margate July 31 1791."

Some papers at the end of the volume show William Douglas, one of the bishop's sons, to have been a college friend of George Canning, and to have served as a mark for the budding wit of the future statesman to play upon. Of this the following specimens will suffice:—

"An Epigram upon Mr. Douglas, of Christ Church, Oxford, by his friend George Canning:—

"There is a difference between a Bishop and a Dean, And I'll tell you the reason why; A Dean cannot dish up such a good dinner as a Bishop,

Nor feed such a fat son as I."

"A Heavy Weight. Mr Douglas son of the Bishop of Salisbury, was 6 feet 2 inches in height and of enormous bulk. The little boys of Oxford always gathered about him when he went into the streets to look at his towering bulk. 'Get out of my way, you little scamps,' he used to cry, 'I will roll upon you.' It was upon this gentleman that Canning composed the following epigram:—

"'That the stones of our chapel are both black and white

Is most undeniably true;

But as Douglas walks o'er them both morning and night,

It's a wonder they're not black and blue.'"

J. J. CARTWRIGHT.

OXFORD LETTER.

Queen's College, Oxford: Dec. 8, 1874.

A University so occupied as this is with examining and being examined cannot be expected to produce much literary work, and the work that is produced is likely to bear more or less directly upon "the Schools." Every now and then, however, we are reminded that we still possess independent students who labour in a serene atmosphere and busy themselves with other problems than that of discovering what will "pay" in an examination. The great event of the present term has been Professor Max Müller's last volume of *Sâyana's Commentary on the Rig-Veda*, the concluding sheet of which was put into the hands of

the members of the Oriental Congress last September. Sáyana flourished in the fourteenth century of our era, and summed up all that had been taught and written on the interpretation of the Veda by generation after generation of commentators, from Yáska in the fifth century B.C. down to his own day. Modern scholars cannot afford to neglect the traditional exegesis of the Hindu Bible, although the comparative method which they follow leads to safer and truer results. But without this traditional exegesis, it is impossible to understand the development of Hindu thought and the later phases of Hindu belief. The editing of this bulky commentary has been a task of thirty years. The first volume was published in 1849, and the collection of materials for it originally brought Professor Max Müller to this country. The labour involved in the work has been enormous: not only have numerous MSS. had to be copied and collated in Paris, London, and Oxford, but Sáyana's quotations from other Sanskrit texts, which are scattered throughout Europe, partly in MS., partly in print, have had to be verified.

More directly connected with the ordinary studies of the place is a volume brought out a few days back by Mr. Wordsworth, called *Fragments and Specimens of Early Latin*. Readers of the ACADEMY are already acquainted with Mr. Wordsworth's knowledge of Latin epigraphy; and the Lectures he published two or three years ago on early Italian ethnology guarantee the goodness of his new book.

A work on the Greek language has also been put forth by Mr. E. Abbott, in the shape of an introduction to the accident of the Greek grammar. The results of comparative philology are made use of, so far as they bear upon Greek, and this is perhaps the most valuable feature of the book.

The two volumes just mentioned very well illustrate the kind of philology most in fashion here. We are still too much cramped and overshadowed by the traditions of a classical education, and the light of a scientific study of language is hardly allowed to penetrate except through the chinks of classical philology. Possibly it is well that our break with the past should be slow and gradual; but possibly, also, we are in danger of losing all that was most precious in old-fashioned scholarship—literary appreciation and interest—without gaining an equivalent wideness of view and scientific spirit. Minute quibblings about the length of a vowel or the occurrence of a particular form are good training for pettifoggers, but not for a school of comparative philologists; and microscopic introspection does but intensify the anti-scientific narrowness which will not look beyond its own small field of study.

That such a result is really to be feared may be gathered from the fact that one of the most interesting and lucid of lecturers, lecturing this term on a most attractive subject, has collected around him but a miserable fragment of an audience. Comparative mythology, one would think, is not only a matter of general interest at the present time, but also one closely connected with the classical studies of the university; but the Oxford undergraduate, with an instinctive scent for what will "pay," has considered that he can better occupy his time in listening to something else.

If Professor Max Müller, however, has been forced to address himself to the elect only, Professor Ruskin has had no reason to complain of the audiences which have been attending his lectures on "Mountain Form in the Higher Alps" and on "The Aesthetic and Mathematic Schools of Art in Florence," from Arnolfo and Cimabue to Angelico and Botticelli. In spite of the hour at which they have been fixed, a time when College lecturers are most busy, he has been obliged to move from the drawing schools to the larger lecture-room of the Museum. Eloquence is still a power here, and epigrammatic denunciation of our ways and manners gives them a piquant flavour.

Strong meat, it seems to be thought, is only fit for men, and the study of our own language has accordingly been handed over to the ladies—and passmen. We have no Professor of English Literature, but Mr. Furnivall has been brought from London to lecture to ladies on our Early tongue. It is possible that English may yet be thought worthy of standing on a level with Greek and Latin; at all events, a move has been made in the right direction, and Mr. Furnivall must be thanked for consenting to be its apostle.

Some new acquisitions of value have been made by the Bodleian Library during the present term. Six MSS. have been purchased from M. Halévy, the well-known traveller, which he brought back with him from Yemen. One of them is a hitherto unknown collection of Midrashim on the Pentateuch, and among the others are a copy of the *Assemblies* of Hariri, and a book of hymns, partly in Hebrew, and partly in a modern Yemen dialect. A Persian history of Timur, the most complete copy known in Europe, has also been acquired, and Dr. Éthé's Catalogue of the Persian MSS. is ready for the press. Among the services rendered by the Library to foreign scholars may be mentioned the use made of the Junius glosses by Dr. Zupitza, of Vienna, for his reprint of Aelfric's Grammar, which essayed to initiate our Anglo-Saxon forefathers into the intricacies of Latin, and the examination of an anonymous Arabic Commentary on the Canticles, by Professor Merx. The Commentary is certainly not later than the eleventh century, and Dr. Pusey has suggested that, as the MS. belongs to the Bodleian, the expenses of publication might well be defrayed by the Clarendon Press. Dr. Pusey himself is bearing the cost of a work of considerable interest to Biblical students, which has been undertaken by M. Neubauer and will soon make its appearance. This is a collection of various Rabbinical commentaries on the fifty-third chapter of Isaiah. The second volume, containing the translation, is being now printed; the first volume, with the original text, is nearly ready.

Mr. Ffoulkes, who has taken up his residence in Oxford, has been giving an account in this month's *Macmillan* of an highly interesting MS. which Sir T. D. Hardy has found in the Bodleian. It is the earliest copy of the earliest text of the Canons of the Church, ending with the fourth General Council in 450. It may be recommended to the notice of Mr. Gladstone in his present controversy with the Vatican, since it illustrates that contempt for the petty considerations of morality for which the Papacy has so often been famous. Pope Zosimus claimed pontifical jurisdiction over the African Church, and rested his claim on a Nicene Canon which could never be discovered. After his death a Sardican Canon was substituted for the imaginary Nicene one, and as the fictitious Canon increased the original number of the Canons of the Sardican Council, some pages have been torn from the Bodleian MS. to make the order of the Sardican Canons given in it agree with that now received by the Roman Church. The MS. belonged to Justellus, the French Protestant who became the librarian of William III.

The question whether the proper end of a University is to endow and encourage research, or to provide a finishing school for the middle-class youth of the country, has been stirred afresh by the recent Report of the Universities Commissioners. At the beginning of the term a paper was sent to each College by the Vice-Chancellor, asking whether they were able or willing to devote any of their revenues to such University purposes as the foundation of professorial chairs or the support of the Bodleian, and, if so, what amount they would give. In some cases an affirmative answer was returned, but the Colleges generally desired further time for consideration. It is unquestionable that the aggregate income of the Colleges is large enough to spare as much money as is wanted for the needs of the Univer-

sity, but it may be doubted whether it would not be better to wait for a scheme from the Government than for the Colleges to take independent and hurried action of their own. Such action must necessarily be incomplete, inconsistent, and interested, and the result of it can never be permanent. We have suffered too much of late years from the worry of constant change and confusion not to long for the prospect of something settled and final, and there was never a more favourable moment for effecting this than the present, when a Conservative Government is in office and our Chancellor is a member of it.

One of the objects for which the University is most urgently in want of funds is the enlargement and security of the Bodleian. Captain Galton reports that the library is without any adequate protection from fire, while the chance of it from overheating, from the nearness of adjacent buildings, and from the old woodwork of the edifice, is very great. Room is also needed for the accumulation and arrangement of books, and fittings for readers and reparation of the external fabric are also required. The estimated cost of the necessary alterations is 38,500*l.*, exclusive of the transference of the examination Schools from their present position under the library to some new and more suitable building. Even with this outlay all chance of fire cannot be avoided, on account of the surrounding buildings, and the Report therefore inclines to the recommendation that the library should be removed to an open space like that of the Parks. Such a removal, however, would be a grievous blow to "sentiment," and Bodley's librarian has written a letter strongly deprecating any change of site. The danger from fire, so far as the adjacent buildings are concerned, seems very slight, and the example of the Pantechicon is evidence that new edifices are not always the most fire-proof. The decision of the matter rests with Convocation; but it must be remembered that a library in the Parks, however conveniently situated for the inhabitants of that aristocratic quarter, would not be so for the great mass of readers, while the erection of new schools would afford sufficient space for the growth of the book shelves. The University has long ago provided itself with a site for the latter purpose by pulling down the Angel Hotel and the adjoining houses in High Street. Certainly the gap thus made can hardly be said to be ornamental, and though the sacrifice of the rents of the demolished buildings may be heroic, it is scarcely compatible with the doctrines of a sound political economy. A. H. SAYCE.

CORRESPONDENCE.

THE MOABITE FORGERIES.

Bodleian Library, Oxford: Dec. 7, 1874.

While the investigations in Palestine carried on so indefatigably by the Palestine Exploration Society and by a great number of *dilettanti* have led to a very limited number of discoveries of inscriptions and other antiquities, the Moabite Limited Company, if I may so call Herr Shapira and his aides-de-camp, boast of possessing about 400 fragments, among which are many with inscriptions.

Considering that the constant attention paid to Phœnician inscriptions for a century past by eminent scholars of all nations, aided by intelligent consuls and their agents, has not brought to light more than about 250 fragments found in Syria, Tunis, Sardinia, and Marseilles, we are puzzled at the abundance of Moabite antiquities found in the short space of four years, and there is good reason why we should have some suspicion of the genuineness of these objects. Happily or unhappily, three facsimiles of these Moabite inscriptions were forwarded from Jerusalem to Professor Schlottmann at Halle and to England, and the learned Professor has published them in full with an elaborate commentary in the *Journal of the German Oriental Society* (vol. xxvi.). A lecture on the longest of these three inscriptions was also delivered by Mr. Heath before the Anthropological Society of London (November, 1872). In the *ACADEMY* of June 21, 1873, I have from the philological point of view declared these inscriptions to be forgeries, and my friend Mr. Vaux, in a communication to Mr. Besant (April 12, 1873) has arrived at the same conclusion from a palaeographical point of view. Professor Socin, of Basel, has also stated that the Shapira collection consists of forgeries, and M. Ganneau, who now leads so ably the Palestine Exploration, and to whom we are already indebted for so many discoveries, has even given the names of the forgers in Jerusalem. The Prussian Government has bought a great number of these Moabite antiquities on the advice of the directors of the German Oriental Society, or rather on the advice of Professor Schlottmann, who has declared in the *Norddeutsche Allgemeine Zeitung* of April 12 (translated in the *ACADEMY* of May 2, 1874), that M. Ganneau is guided in his statement by pure *chauvinisme*. One could wish that the contest for the possession of the Rhenish provinces and Alsace-Lorraine were banished from Europe and transplanted to Moab, but this unfortunately cannot be. Professor Schlottmann, not satisfied with the article mentioned above, comes out with

another elaborate one in the last number of the *German Oriental Society's Journal*, in which he gives the result of enquiries made by the German Consulate, which turn out all in his favour and declare the Moabite antiquities to be genuine. Far be it from me to apply to him the French proverb "*Qui s'excuse s'accuse*;" but it is strange to make an appeal to political testimony on a question where an adverse verdict has been given by philology and palaeography. I should have thought that one of the eminent scholars, either of our own country, such as Dr. Wright at Cambridge, or of the Continent, might well have settled this dispute by giving his opinion without reticence or personal regard, and surely a better occasion could not have been found than at the late International Congress of Orientalists. But this not having been done, and fearing that the public may be misled by some recent articles addressed by "R." to the *Athenæum*, I beg leave to ask the favour of repeating, in answer to them, the view I previously expressed in your columns, that the three inscriptions published by Professor Schlottmann must be forgeries. As to No. 1, not a single word can be explained from the Hebrew, with which the Moabite dialect is most nearly connected (as is to be seen from the Mesha inscription), and not even from any Semitic dialect. The second one, the beginning of which Professor Schlottmann translates "a gift to Rosh" (rather "a gift to the poor") contains, it is true, pure Hebrew words, but the sentence is nothing else than a phrase taken out of some late Hebrew book of ethical sentences, or is, perhaps, a copy of the words in Prov. xix. 6 transposed. So far for the philological point of view. The palaeography is still worse handled by the forger: I rely here upon the authority of Mr. Vaux. The forms of the *dalet*, *lamed*, *nun*, and *yod*, as given in these inscriptions, do not occur in any purely Phœnician inscription; while the form of the *aleph* on the Moabite pottery is that of the latest period of Phœnician writing, that of the *tau*, on the contrary, is that of the most archaic; and, stranger still, the *kaph*, *mem*, and *resh* occur in the same inscription in two forms—one the common form, the other that form simply reversed, the latter case being unparalleled in Phœnician palaeography. "My belief is," writes Mr. Vaux, "that the potter wanted to make an inscription which at first sight should look a little like the Moabite (Mesha) one, but, in his ignorance, has jumbled together characters of different dates, beside reversing letters never reversed in genuine Phœnician." Beside these irregularities, Himyaritic characters also often occur in these inscriptions. I should be glad to learn from Professor Schlottmann how the Moabite engraver was acquainted with these forms of letters, which are only to be found on the inscriptions of Yemen and a part of Ethiopia, and which are not earlier than the Christian era. One of these inscriptions occurs on the back of the Goddess of the Earth, as Professor Schlottmann calls her. I do not profess to be an archaeologist, but I venture to suggest that the physiognomy of the goddess is neither Moabite nor Oriental, but much more like that of a German young lady. Perhaps Mr. Newton, of the British Museum, would be kind enough to give his opinion on this matter. Nor do I pretend to decide whether the forgery was made at Jerusalem, Damascus, Paris, or even Birmingham, or whether the forger is to be called Selim el Kari or Monsieur So and So; but I positively affirm that the inscriptions are forgeries, and that it is a disgrace to support them in the learned journals of the German Oriental Society.

AD. NEUBAUER.

THE BHARHUT SCULPTURES.

London: Dec. 8, 1874.

I am afraid the materials do not yet exist in this country for any satisfactory discussion regarding General Cunningham's wonderful discoveries at Bharhut. We must wait for further details, but meanwhile it seems so important that

erroneous impressions should not be allowed to pass unchallenged, that I hope I may be allowed to make a few remarks on Professor Childers' letters in your two last numbers, and Mr. Beal's in your last.

So much depends on the correctness of General Cunningham's readings, that I am delighted to find Mr. Childers is able to bear such distinct testimony to the accuracy of his interpretation of the legend attached to the bas-relief representing the acquisition of the Jetavana Garden. This is an enormous gain to Buddhist literary history, but I wish he had taken the opportunity to revise or recall the emendation he made in your previous issue on the inscription which the General reads as "Erapātra the Nāja Raja worships Buddha" Bhagavat.

I feel convinced the Professor must be mistaken in his alteration; in the first place, because that part of the inscription which is visible in the photographs—one half is in shadow—is so clear and distinct—the letters so deeply and sharply cut, that it seems inconceivable that one so long familiar with this simplest of alphabets could have made such a mistake. A more important point, which anyone looking at the photographs can decide for himself, is that the tree which Erapātra is worshipping is not the Bodhi tree of the last Buddha at all, but one of a totally different species. Fortunately, in the same photograph, there is another bas-relief from another pillar, representing a tree which two men are worshipping—in a rather eccentric manner, it must be confessed, by holding their tongues between their fingers and thumbs. Above, flying figures—Gandharvas—are bringing wreaths as offerings; and below is a perfectly distinct inscription, which General Cunningham reads: "Bhagavato Saka munino Bodhi." (The Bo tree of Sakya Muni.) Now it requires only a very slight knowledge of botany, and still slighter familiarity with the sculptures at Sanchi, to see at once, even without the inscription, that this sculpture is intended to represent the Pipal tree (*Ficus religiosa*), which is, and always was, the Bo tree of the last Buddha, and which, or whose lineal descendants, still grows at Buddha Gya and Amuradhapura. On the other hand, the tree which Erapātra is worshipping is a flowering tree of a totally distinct species, but for the identification of which the photograph is not sufficiently clear. Although, therefore, the Professor's emendation may make the inscription more grammatical—on this I am not competent to express an opinion—it appears to me to have the insuperable defect that it contradicts the facts represented in the bas-relief to which it is attached. The General's interpretation, on the contrary, perfectly accords with them.

The same facts, if I mistake not, equally dispose of Mr. Beal's theory that the altar in front of these trees represents "the seat or throne on which Buddha was seated under the Bo tree when he arrived at complete enlightenment."

If Mr. Beal were as familiar with the botany of the Sanchi sculptures as I unfortunately have been forced to become, he would have seen that this altar or throne exists not only in front of the Bo tree properly so called, but of four or five other trees of totally distinct species. Not to multiply instances unnecessarily, I would refer him to the three figures of plate xxv. of *Tree and Serpent Worship*, or to the woodcut on the following page (130) from the contemporary rail at Buddha Gya, all of which are as different as can be, and not accidentally so, for they are easily recognisable, *inter se*, when repeated, though their botanical names have not yet in all instances been determined. Unless, therefore, Sakya Muni sat—miraculously—under five or six different trees of different species at the moment of enlightenment, these can hardly represent seats, but must be altars, which from their form and position they seem undoubtedly to be.* The probability seems

* When Mr. Beal reads Mr. Childers' letter in your last issue, he will be aware that he has mistaken a

to be, that these trees may be the Bo trees of preceding Buddhas, but this we shall not know for certain until we get home a complete set of the Bharhut sculptures. In the meanwhile, I would like to suggest that the term Bhagavat in this inscription does not mean Buddha. That epithet was applied to him only after the Christian era, when he became personally worshipped. As General Cunningham says of the Bharhut sculptures, in a private letter to me, echoing the words I had used regarding those of Sanchi, "it is Buddhism without Buddha: no representation of him as Buddha appearing anywhere." The word as here used seems to mean only the holy or sacred thing or person—the, or a deity or numen.

As I am writing, perhaps I may be allowed to point out an interesting feature in the Erapatra bas-relief which has not yet been mentioned by anyone, in print at least. At some distance behind Erapatra is a second Nāga Raja, similarly distinguished by having a five-headed snake on the back of his head, and behind him again their two wives, each, as usual with Nāga women, having only one-headed snakes behind them. Between the two Rajas, and occupying the central position in the bas-relief, appears the great five-headed Nāga himself. It is not clear what the second Raja and the women are worshipping. They are looking to the front, though their hands are joined in the attitude of prayer, and their adoration may be addressed to either the tree or the serpent. Be this as it may, no one can, I think, look at this bas-relief without perceiving that the Tree and the Serpent are coequal, and that they are being worshipped by a people distinguished by the Nāga badge.

Whenever the details of the Bharhut sculptures are given to the public, every one will, I believe, admit that they form the most important contribution for the illustration of early Buddhist history and art that has been made since James Prinsep, some forty years ago, deciphered the Lāt alphabet. In the particular department which I took up some time ago nothing could be more gratifying to me than the discovery of this Erapatra bas-relief. It forms so complete an epitome of all I wrote in my *Tree and Serpent Worship*, and with the other sculptures so completely confirms all I there said, that so soon as I can get a sufficiently good photograph of it, I will have it engraved on a second frontispiece for my work, and so take leave of the subject. The task of carrying the history two centuries further back than my materials allowed me to do, and of completing the pictorial illustrations of the subject, belongs to the fortunate discoverer of Bharhut. In resigning the task to him it is pleasant to think that, though adding so much to our previous stores, the Bharhut sculptures upset nothing that was before advanced. Only what were necessarily theories when I wrote have now become facts, but without invalidating any of the conclusions previously arrived at or requiring me to retract anything I then advanced.

JAS. FERGUSON.

38 Clanricarde Gardens, W.; Dec. 8, 1874.

The significance of General Cunningham's discovery is not limited by its archaeological results. On the contrary, it will be the opinion of many that its archaeological importance is quite eclipsed by its bearing upon the antiquity of the Buddhist records. At a time when scepticism has been carried to the utmost extreme to which it could be pushed without becoming positively ludicrous, up rises this second and better Moabite Stone from the earth, to place the South Buddhist records on a firmer basis than they ever yet occupied.

bas-relief representing four men playing at draughts, or Puchi, for that representing the purchase of the Jetavana Monastery. His transliteration of the inscription is, however, correct; it is consequently not to be wondered at that he was puzzled with its application.

The Jātaka Nidāna, from which I quoted last week, is a summary of the Legend of Buddha, written by Buddhaghosha in the fifth century A.D., and forming his preface to the 550 Jātaka stories. It is compiled from older records (Tripiṭaka and others) which he frequently mentions by name, referring the reader to them for details of some event of which he merely gives a brief abstract. In the first passage quoted by me last week, it will be seen that, in his version of the story of Anāthapindika, he has but briefly mentioned the purchase of the Jetavana garden, while he has given details of the building and donation of the monastery. It would be interesting to meet with the original and detailed account of the purchase, but at present I confess I do not know where to look for it. It is, however, probably in one of the early books of the Tripiṭaka, and, if so, we shall meet with it sooner or later. In the meantime the friends of Buddhism may well rest satisfied with having found graven on the rock, 200 years before Christ, the very words of those South Buddhist records which a certain set of critics are for ever proclaiming to be devoid of antiquity and authenticity.

R. C. CHILDERS.

SHAKSPERE AND MARLOWE.

114 Oxford Road, N.: Dec. 8, 1874.

Mr. Gosse's letter in last week's *ACADEMY* has reminded me of a passage in one of Marlowe's songs which is strikingly similar to the opening soliloquy in *Richard III.*—

"Faith wench! I cannot court thy sprightly eyes,
With the base viol placed between my thighs:
I cannot lisp, nor to some fiddle sing,
Nor run upon a high stretched minikin.
I cannot whine in pining elegies,
Entombing Cupid with sad obsequies:
I am not fashioned for these amorous times,
To court thy beauty with lascivious rhymes:
I cannot dally, caper, dance and sing,
Oiling my saint with supple sonnetting."

MARLOWE.

"He capers nimbly in a lady's chamber
To the lascivious pleasing of a lute.
But I, that am not shaped for sportive tricks,
Nor made to court an amorous looking-glass;
I, that am rudely stamp'd and want love's majesty
To strut before a wanton ambling nymph."

Richard III. act 1, sc. 1.

The resemblance between these two passages is, I think, much too strong to be accidental, and the only misgiving I feel is that it is too striking not to have been noticed before. J. G. MATHEWS.

AN ALLUSION IN "HAMLET."

In the Players' Play in *Hamlet*, Act III. sc. ii., Hamlet, eager for the crisis of the play, calls out to Lucianus, the nephew who is to poison his uncle, the King:—

"Begin, Murderer. Pox, leave thy damnable Faces,
and begin. Come, the croaking Rauen doth bellow
for Reuenge." (Folio, p. 268, col. i.)

Now there can be no doubt, I think, that "the croaking Rauen,"* the bird of the Royal House of Denmark (Malleon), is the Ghost of Hamlet's Father; and also no doubt that in Shakspeare's play, as we have it, the Ghost does not "bellow for Reuenge." Most of the late commentators and editors consider that the words "the croaking Rauen doth bellow for Reuenge" are a quotation from some old play known to the players. I suggest that this old play is the old *Hamlet* of which Lodge speaks in his *Wits Miserie*, and the *World's Madnesse*, printed in 1596, in which he thus describes the fiend "Hate-Virtue":—"He walks for the most part in black, vnder colour of grauity, and looks as pale as the Visard of y^e ghost which cried so miserably at y^e Theator like an oister-wife, *Hamlet, reuenge*" (Clarendon Press *Hamlet*, p. vi.). As Messrs. Clark and Wright say, "This

* He is one of Odin's birds, and continually figures in Norse and Anglo-Saxon poetry.

last quotation would alone be sufficient to prove that the play in question was not the *Hamlet* of Shakespeare." At first I thought Hamlet was speaking of the Ghost's charge to "*revenge* his foul and most unnatural murder" (I. iv. 25), as still present to his (Hamlet's) mind; but I had to give this up because Lucianus is evidently expected by Hamlet to understand the allusion. The passage in the old play alluded to by Lodge shows that the player would at once catch the reference.

F. J. FURNIVALL.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Dec. 12,	3 p.m.	Crystal Palace Concert (Schubert's Symphony in C).
"	"	Saturday Popular Concert (St. James's Hall).
	3.45 p.m.	Royal Botanic.
	8 p.m.	Royal Albert Hall—Popular Night (Sims Reeves).
MONDAY, Dec. 14,	8 p.m.	Society of Arts: Dr. B. W. Richardson on "Alcohol, its Action and Use" (Cantor Lecture).
"	"	British Architects. Medical.

SCIENCE.

Observations of Magnetic Declination made at Trevandrum and Agustia Malley, in the Observatories of his Highness the Maharajah of Travancore, G.C.S.I., in the Years 1852-1869. Vol. I. Discussed and edited by John Allan Broun, F.R.S., late Director of the Observatories. (London: Henry S. King & Co, 1874.)

THE generally received opinion of the pursuits of the native princes of India would not lead one to imagine that there is much prospect of the advancement of science receiving attention at their hands, but the book now printed by order of the Maharajah of Travancore (a small state occupying the extreme southern point of Hindostan) tends to prove that, at least in the case of one of them, such a supposition would be fallacious.

The title of the work, which is a handsome volume, quarto, 600 pages, at first sight would appear to indicate a dry collection of tables and figures. Some of these,

of course, are necessary; but, in addition to them, there is a considerable amount of most interesting matter to the general reader in the descriptions of the adventures and troubles of a scientific man in Southern India, while the magnetician and physicist will find much to occupy his attention in the various results which Mr. Broun has so clearly brought out in his discussion of the observations, and in the description of the very ingenious instruments he constructed and employed in his researches.

The Observatory at Trevandrum was originated with a view to astronomical observations; but as, at the time of its erection, that great movement, inaugurated by Humboldt, Gauss, and others, was just set on foot for the establishment of a chain of observatories to be especially devoted to magnetic observations, round the whole world—which has since, in the hands of the indefatigable Sir E. Sabine, furnished such magnificent results—the Rajah, on its being represented to him that Travancore, situated as it is on the magnetic equator, was a most valuable spot for a magnetic observatory, at once commissioned the Director of the observatory to purchase all the necessary instruments with which to furnish such an institution. Accordingly, in 1841, the observatory was completed and observations commenced.

Mr. Broun became attached to the observatory in 1852, and his labours there terminated in 1865, since which date the observatory has been entirely in the hands of native observers, while Mr. Broun receives for discussion in Europe the observations which are forwarded to him for the purpose.

It is a feature in such an investigation as cosmical magnetism, that there is but little possibility of an enquirer suddenly alighting upon a chance discovery, as an astronomer may upon a new comet, a naturalist on a strange organism, or a geologist on an undescribed fossil. The watching and recording the microscopic movements of the magnetic needle from day to day and year to year, is a task calculated to tire out any but the most ardent enthusiast, and afterwards the voluminous computations which the discussion of the observations obtained entails, perhaps leading only to a negative result, all tend to reduce the devotees to this particular department of scientific enquiry to a very limited number, among whom Mr. Broun may with justice be placed with the foremost.

The Trevandrum observations, treated in the volume before us, only concern the one element of terrestrial magnetism, Declination; but the changes this undergoes under almost every combination of action of the sun and moon, have been investigated, and the tables giving the annual, decennial, secular, and other variations, are compared with similar tables published by other authorities.

The movement due to the sun's rotation is fully examined, showing that from magnetic considerations the latter must take place in twenty-six days.

A period of inequality, one of forty-four days, which has hitherto escaped notice, has been discovered; but the author states that he has been unable to find any cause which could produce an effect of this duration.

We miss in the volume any investigations bearing on that most interesting class of magnetic phenomena, magnetic storms, so ably treated of by Sir E. Sabine and the Astronomer Royal, in numerous papers in the *Philosophical Transactions* and elsewhere. Mr. Broun seems to have discussed together the whole of the observations without first separating the disturbed readings from the undisturbed, a course which it appears not improbable may account for some of the differences between his results and those of other magneticians.

One enquiry, and a most important one, carried out very fully, is the comparison for ten years of two instruments designed for the same purpose, but of different constructions, by the use of which the changes due solely to instrumental defects were separated from those due to extraneous causes.

The meteorological work in Travancore is very briefly alluded to, the only thing of note being Mr. Broun's investigation of the cause of the semi-diurnal oscillation of atmospheric pressure, so large and regular in the tropics. For this purpose he organised and carried out a series of expeditions in the hills and forests around the Agustia Mountain; and the results of his observations, as far as he has reduced them, have lead him to the conclusion that Dove's theory is not a correct one.

As an instance of the risks he ran when on these and other expeditions of the kind, the following extract from his notebook is quoted:—

"1863, April 10. Left the chalet at 6 A.M.; strong breeze from E. Sun shining all the way down, and very hot when I got to the station, which I did near 10 A.M. Thermometer in the shade 96° Fahr. Found a place to observe in—a little opening amidst long grass, and under the shadow of a small, thinly-leaved tree—but the shadow moved soon off the theodolite; dreadfully hot; long grass all around (fine tiger ground, lots at the place; had an idea occasionally that one might pounce on me in the silence while observing, and carry me off. I could not even keep my revolver near me on account of the iron affecting the magnets; this annoyed me). Tried to observe the sun's altitude, but it was too high to be easily observed, and too hot to expose the bare head [as was necessary with the telescope nearly vertical]; I, however, risked a *coup de soleil*, and observed one limb. I left the station about half an hour after noon; the climb to the hut at Nangard (on a bare hill about 1,000 feet above the station) was exceedingly disagreeable. The sun was fierce, the soil burning; the slope up which I climbed was in some places inclined nearly 20°, and the face right opposite to the heated earth; long grass around, not a breath of air—stifling. I had to rest several times, gasping for breath and feeling that if I made one step farther I should tumble over. I reached the chalet at Podia Malley at 6½ P.M."

The six appendices prove what a variety of work falls to the share of a scientific official in India; they show that, in addition to the building of the observatory, training of observers, construction of instruments, organisation of observations, &c., the author was employed in many other capacities. He established a museum, laid out public parks, zoological and botanical gardens, in addition to which he performed sundry feats of engineering required, at-

tended to the education of the country, was also instrumental in organising systems of weights and measures, and fixing the local currency.
G. M. WHIPPLE.

THE TRANSIT OF VENUS.

Royal Observatory, Greenwich, Dec. 11.

TELEGRAMS have been received from a large number of stations, announcing the measure of success which has fallen to the lot of the observers sent out by different nations; and certainly, so far, astronomers have not much to complain of in the matter of weather, as will be seen from the following table of the results at the stations from which news has been received up to the present time:—

Complete Success.	Partial Success.	Failure.
Cairo.	Ispahan.	Shanghai.
Thebes.	Wladiwostok (Siberia).	Madras.
Suez.	Adelaide.	Blagowesch- techenk.
Bushire.	Hobart Town.	Omsk.
Roorkee (N.W. Pro- vinces, India).	Robe, Victoria.	Orenburg.
Calcutta.	Possiet.	Uralak.
Kurrachee.	Habarowka.	Kazan.
Nagasaki (Japan).		Astrachan.
Hiogo (Japan).		Kertch.
Melbourne.		Tiflis.
Tschita.		Erivan.
Jalta.		Naktritchewan

At Cairo Captain Ord Browne and Mr. Newton got good observations of internal contact at egress, though they differ by four seconds in the time noted. Captain Browne remarked a ring of light surrounding the black planet, which may have been caused by the atmosphere of Venus. Both he and Mr. Hunter at Suez obtained a good many measures with Airy's double-image micrometer of the distance of Venus from the sun's limb before internal contact, and of the length of the cusps after, observations which are nearly as valuable as those of the actual contact. Mr. Hunter also observed the latter phenomenon well, the clouds, which had been very threatening, clearing off just before the critical time. Captain Abney at Thebes was very successful with his photography, obtaining a good series of fifty photographs of Venus, at intervals of a second, with the Janssen revolver slide, so that a photograph has been secured of the actual contact, which besides its intrinsic value is of great interest from the fact that there is no trace of the black drop which was such a trouble to Captain Cook and the other observers in 1769. This agrees with the testimony of all the telescopic observers, who are unanimous in saying that nothing like a connecting ligament has been seen in this transit, a circumstance which is probably owing to the great improvement in telescopes and to the education of the eye by previous practice in observing a model.

Colonel Campbell, Dr. Auwers, and Professor Döllén, made good observations with their telescopes at Thebes.

The Roorkee party, headed by Colonel Tennant, have been highly successful in the most important part of their work, the photography, having taken 100 good photographs besides securing the eye observations. In Japan M. Janssen has worked his revolver photographic slide well, and sixty ordinary photographs on glass have been taken by the Americans, and numerous daguerreotypes on silver plates by the French. Further, 150 measures of the lengths of cusps were made, and thirty-one differences of R.A., and eighteen differences of N.P.D. of the limbs of Venus and the Sun observed. The longitude of the American station at Nagasaki was determined in November by telegraph, using Wladiwostok as the point of reference.

At Ispahan the German party got nineteen good photographs, and at Wladiwostok Professor Asaph Hall got thirteen, though the weather was very unfavourable. Altogether, Madras seems to have been the only case of failure, and it is not an important station, though observations made at a fixed observatory, of which the position is well

determined, would have been useful. At Shanghai it is believed that no astronomers were stationed, the French, American, and German parties being all bound for the north of China.

News may be expected from Lord Lindsay at the Mauritius, and from the remaining British stations in New Zealand, the Sandwich Isles, Rodrigues, and Kerguelen, in the course of the next fortnight or three weeks.

W. H. M. CHRISTIE.

NOTES AND NEWS.

A NEW comet was discovered by M. Borelly, at Marseilles, on the morning of December 7, in the constellation Corona, its right ascension being 16h. 0m., and its North polar distance 54°, so that it is visible low down in the north-west after sunset; but, though described as brilliant by its discoverer, it requires a powerful telescope to show it. From an observation made by Mr. Hind in the evening of December 7, it appears that its daily motion is nearly 1° N.N.E., so that there is a good prospect of further observations being secured.

THE *Revue Scientifique* has reported in various numbers a series of lectures delivered by M. Claude Bernard at the Musée d'Histoire Naturelle, Paris, in continuation of previous courses on "the Phenomena of Life common to Animals and Plants," from which we propose to extract a few passages most likely to interest those who, without being students of physiology, desire to become acquainted with the philosophy to which it leads. The fundamental proposition enforced in these lectures is that there is a vital unity running through the whole history of plants and animals; in both the fundamental element is an organised cell endowed with "nutritive irritability," or faculty of nutrition. It is not necessary to stop at this point in order to show the exact limitations under which the term cell is used, and which M. Bernard does not explain, as it does not affect his statements that all organisms are composed of cells, and that organic phenomena are compounds of nutritive actions. "To know nutrition," exclaims the lecturer, "is to know life itself, for there is nothing in the most complex vital manifestation which does not in some degree exist in its elementary manifestation." In another passage he says, "nutrition is only a continued generation." Hence there is a constant relation between the two processes, and in studying the history of an "organic element" in a relation of constant exchange with its surrounding medium, nutrition and generation "are so confounded that it is impossible to determine what is to be assigned to one, and what to the other."

Speaking of the part played by the nucleus in cells, he alluded to its being a "nutritive or a generative centre" in simple organisms like infusoria, according to the phases of their evolution. "All evolution is the development of an anterior state into a successive series of states; it is a continuation of which the last terms, however complicated they may be, are potentially contained in the point of departure, however simple it may be." Whether we look to plants or animals, the body which is in evolution is regarded as having received a primal impulse, the consequences of which are successively unfolded. Among the lower creatures sexuality is combined with scissiparity and gemmiparity (generation by division and by buds), the two last being temporary exhibitions of energy that becomes exhausted, and requires to be renewed by a concurrence of the two sexes. Taking the *Paramecia aurelia* for an example, M. Balbiani found that one individual 0.2 mm. produced by divisions 1,384,416 individuals, whose united length would extend to 277 metres, or rather more than 302 yards; but gradually the energy of nutrition and fission diminished, the progeny became smaller and weaker, and then by a junction of two individuals a fresh series was

started, having a renewed impulse of nutrition. Regarding higher organisms as an assemblage of cells losing their nutritive and propagating powers by gradual exhaustion, they naturally tend to old age and decay:—

"The growth or evolution of an animal or plant might be considered as a kind of histological parthenogenesis, or alternation of anatomical elements. The elementary union of a male and female cell gives rise to a new cell, the fecund egg or germ, endowed in a high degree with plastic and evolutive powers. From this primitive cell proceed by agamic methods the immense number of generations of cells which form the blastoderm, and subsequently the animal. Their fecundity constantly diminishing ends fatally in the ruin of the structure, the death of the individual."

From this point M. C. Bernard traced the various researches and discoveries, explaining the origin and structure of the eggs of various animals, including the mammalia, in which the egg is in a minute body about one-tenth of a millimètre (about 200th of an inch), floating in the Graafian vesicle, and which, though so small, is analogous to the entire yolk of a fowl's egg, and is a "cell composed of three concentric spheres: the vitelline sphere, envelope and contents; Purkinje's vesicle, and in it the spot or spots of Wagner."

For details of the structure of the egg we must refer the reader to the original lectures, and pass to a view of that structure which will be new to many. "It is clearly shown," says M. Bernard,

"how incorrect was the opinion of physiologists thirty years ago, who regarded an egg as an element pre-existing in form and structure, that fecundation happened solely to draw it from inertness, and cause it to grow and develop a new creature. Far from this, the egg is in a state of perpetual irritability. It undergoes perpetual transformations; grows, develops, exercises an attraction on surrounding elements, and becomes complex; passes from the condition of a simple nucleus with undivided protoplasm to that of a complicated apparatus formed of three enveloping spheres. The development continuing Wagner's spot disappears; the germinative vesicle ceases to be visible; the aspect becomes uniform; the existence of the egg draws towards its conclusion; it would cease were it not for the intervention of a new element. At this moment fecundation is accomplished; the male element re-animates the declining power, and gives it a fresh virtue of evolution. Thus we see the egg is a living being endowed with individuality and intense life."

We shall resume the subject of M. C. Bernard's lectures in another number.

M. BECQUEREL, in support of a project for establishing an observatory for physical astronomy, has addressed a note to the French Academy, in which he says:—

"The identity of formation of the sun and the earth and of all the planets that gravitate round our primary star, being admitted, we may assume that its present condition is the same as that of our own planet in the early days of its formation, when it had either no crust or only a slight one. The earth's cooling from radiation must have been much more rapid than that of the sun, as the volume of the sun is 1,326,480 times that of the earth. We may thus compare the physical and chemical actions now going on in the sun with those which formerly occurred on the earth. The mass of vapours which then constituted the earth, subjected to a gradual cooling, passed successively from a gaseous to a liquid state, after which its surface became covered with a solid crust, thickening with the lapse of time. From these circumstances must have resulted a crowd of physical and chemical phenomena. At first, from excess of the temperature, all the elements must have been dissociated; as the temperature became lower, chemical affinities began to operate, and the compounds formed passed in succession to gaseous, liquid and solid states. While these chemical reactions occurred, there must have been an enormous and proportional development of electricity, and by the reunion of the two electricities the newly-formed atmosphere must have been in a glow of lightning, while thunder resounded in all parts. The third epoch was when, the temperature sinking below the boiling-point of water, the quantity of that fluid augmented by condensation. This primitive water

probably contained carbonic, sulphuric, and other acids, which saturated the bases, and from these reactions arose the great calcareous masses found at different parts of the terrestrial crust."

There must have been a slight slip here, as so eminent a philosopher as M. Becquerel cannot suppose that the existing limestones that are accessible to us, and which are fossiliferous, belonged to the primitive formation of which he speaks. The first formed rocks of the earth's crust must have been modified, unmade and remade over and over again before the appearance of man. For any material to be in the primitive state, it must have been kept out of the way of atmospheric and aqueous action.

MR. J. BAILLIE HAMILTON writes to us:—

"I see that your correspondent, in reporting a lecture to the Physical Society on November 20, very naturally confused my account of Mr. Farmer's labours with those of previous inventors, whereas it was specially pointed out that Mr. Farmer surpassed them all by using a regular 'reed,' instead of merely modifying a string, thereby producing notes of great beauty."

We are glad to learn that the second part of Geiger's *Zeitschrift* for 1873 will shortly be brought out by his son, the young and able historian, Dr. Ludwig Geiger. It will contain a "Nachwort" by M. J. Derenbourg.

THE Commission for the "impressions gratuites" at the National Printing Office at Paris has granted 16,000 francs to M. H. Derenbourg for the publication of the earliest Arabic grammar by Sibawayeh. M. Derenbourg, after having collated the Paris and St. Petersburg MSS. and established a correct text of the work, will begin the impression early in 1875. He is about to apply for the loan of the commentary on the poems quoted by Sibawayeh existing in a MS. of the Bodleian Library. It is to be hoped that M. Derenbourg will be able to give as *additamenta* some important variations out of the MSS. at Bulaq and in the Escorial.

M. JOSEPH HALÉVY, the well-known traveller in Ethiopia and Yemen, is publishing in Paris for the Alliance Israélite Universelle, the original of the Prayer-book of the Phalashas (Jews of Ethiopia), with a Hebrew translation.

MEETINGS OF SOCIETIES.

CAMBRIDGE PHILOLOGICAL SOCIETY (*Thursday, Dec. 3*).

THE President (Professor Cowell) read a paper on the word "glamour," illustrating it by the legend of Glam in the Grettis Saga and a passage from the Sturlunga Saga, describing the effects of glámsýni, or glamour-sight. The word glám, or glámr, is an old Norse word for the moon, which, though not found in the old literature, is given in the glossary of old words in the Prose Edda. Can it be identified with the old Sanskrit word *glau*, or *gláv*, "the moon," which is found in the Unádi Sūtras and the old lexicons? Some passages were quoted from Sanskrit poets, describing the "glamour-sight" produced by the moon.

He also read a paper on the Hindu idea of the relative harshness and softness of letters. The native writers on rhetoric describe three different styles (*gunas*), that of sweetness, of strength, and of clearness. The first of these is most appropriately expressed (as far as regards the words) by the nasals placed before any other letter except the hard (or lingual) *t*, *th*, *d*, *dh*, and by *r* and *ṛ* followed by a vowel, and by a very moderate use of compound words. Strength of style is produced by the tenues and mediae joined with their respective aspirates—*r* preceding or following another consonant—*ś*, *sh*, *t*, *th*, *d*, *dh*, doubled consonants, and the abundant use of compound words.

Mr. Fennell read a paper on the interpretation

of the *Nicomachean Ethics*, v. 5, sec. 12; and Mr. Jackson read a few remarks upon Mr. Fennell's paper.

LINNEAN SOCIETY (Friday, Dec. 4).

DR. G. J. ALLMAN, F.R.S., President, in the chair. Professor Huxley read a paper on "The Classification of the Animal Kingdom." A report of this paper, the classification advocated in which is founded on principles of development as well as of structure, will be found *in extenso* in *Nature* of the 10th instant.

ASIATIC SOCIETY (December 7).

R. N. CUST, Esq., in the Chair. The following gentlemen were elected members:—Dr. C. Charnock, Rev. A. H. Sayce, Captain Fuller, Messrs. C. J. Sassoon, F. Pincott, G. N. Souratt, E. N. Overbury, R. T. Reid, P. R. Chetti, B. Rāmavāmi Iyengar, and J. C. Pritchard.

A paper on "The Nāsik Cave Inscriptions," contributed by Professor Bhandarkar, of Bombay, to the International Congress of Orientalists, was read. The text and translation of these inscriptions were published by the late Rev. J. Stevenson, in the Journal of the Bombay branch of the Royal Asiatic Society. Professor Bhandarkar now furnishes considerably revised copies of these important documents, most of which are written in Prakrit, or popular dialect, together with fresh translations, critical notes, and Sanskrit versions of those in Prakrit. In one of these inscriptions King Gautamiputra Sātākarni is said to have overthrown the race of Khagārata. This name Professor Bhandarkar identifies with the Kshatrapa (Satrap) Nahapāna, whom he takes to be the founder of the Saka era in A.D. 78, to which he refers all Sah dates. The date of the Sah king is read by the writer as 250 or A.D. 323, about which time he accordingly places Gautamiputra. An older inscription mentions King Krishnarāja, of the Sātavāhana race. Professor Bhandarkar identifies this race with the Āndhrabhritya dynasty of the Purānas, which is generally taken to have ruled from B.C. 21, and in whose list Krishnarāja stands second. This race, according to the writer, was, soon after Krishnarāja, subjected by the Sah king, Nahapāna, and not rehabilitated until the time of Gautamiputra.

A paper, by Captain E. Mockler, on "The Transliteration of Persian and Arabic Words," was also read. In the discussion which followed Professor Chenery, Colonel Sir Frederick Goldsmid, Mr. E. T. Rogers, and Mr. N. B. E. Baillie severally stated their views on the subject.

ANTHROPOLOGICAL INSTITUTE (December 8).

J. E. PRICE, Esq., F.S.A., in the Chair. Mr. M. J. Walhouse read a paper "On the existence of a Leaf-wearing Tribe on the Western coast of India." The author's residence at Mangalore for some years afforded him the opportunity of studying the habits of the native tribes of South Canara, and in the present communication he recorded a few facts concerning the Koragars, a remnant, now numbering only a few hundreds, of the aboriginal slave caste whose distinctive peculiarity was the habit of wearing aprons of woven twigs and green leaves over the usual garments. The custom at present is observed by the women only, who think that discarding it will bring them ill-luck. The author maintained that the leaf was a badge of degradation, and was a survival of a very ancient custom. The unswerving truthfulness of the Koragars is proverbial, and should be remarked as affording a complete refutation of Mr. Mill's assertion that savages are invariably liars. The paper contained many interesting facts concerning the physical characteristics, traditions, religious rites, and habits of the tribe. A paper, by Mr. Rooke Pennington, was read on some tumuli and stone circles near Castle-

ton, Derbyshire. It comprised a full account of the exploration of the barrow of Elden Hill, measuring 49 feet in diameter, which yielded bones of man, horse, and rat in great abundance, and a red deer's antler that had been worked. A few feet deeper was discovered a grave containing a skeleton of a young person that had been buried in a contracted position; no implements were found with it, but it appeared to have been interred with much barbaric pomp. On the top of Siggett Hill was another barrow of somewhat less dimension, in which was found a fine skeleton with inverted urn of the usual type containing burnt bones. Evidence was adduced to prove that the corpse was not burnt until after the funeral feast was concluded, and the bones of the animals eaten were cast at the same time, and into the same fire, with the human body. This was one of those barrows which had led the author to conclude that, in Derbyshire at any rate, no connection can be established between the neolithic age and contracted burial and the bronze age and incineration. Major Godwin Austen contributed some further notes on the Stone Monuments of the Khasi Hills.

FINE ART.

THE INSTITUTE OF PAINTERS IN WATER-COLOURS.

THE Ninth Winter Exhibition of Sketches and Studies opened, on December 7, at the Gallery, 53 Pall Mall. Two of the contributors come out with conspicuous strength; there are others of some proportionate degree of merit; and, on the whole, the collection may be considered moderately agreeable—not certainly more than that.

The two excellent exhibitors are the figure-painter Mr. Herkomer, and the landscape-painter Mr. Small. Mr. Herkomer sends three works—*A Gossip, Der Büttgang, and Carnival Festivities in the Alps*. The first, comprising a couple of female figures, is principally remarkable as a painting of the brilliancy and freshness of early spring—the blossoming fruit-trees casting sharp thin shadows on the sunny verdant grass. The *Büttgang* is one of those peculiar subjects of which a true artist, working with direct and unexaggerating fidelity, can make a good deal, though it would be worse than unrepaying in other hands. It represents five persons, of both sexes, standing in loose order one behind another on an ascending mountain-road, in Switzerland probably, or the Tyrol: they are daily and inveterate beggars, and have posted themselves here to waylay any and all of the numerous tourists who are certain to pass by that road ere "the night cometh in which no man can work"—or beg. Each of these personages is perfectly individualised, and drawn with most skilful accuracy. The *Carnival Festivities* is not carried far beyond monochrome: it shows us a bleak snow-covered spot, with all sorts of rough-and-ready maskers in a quaint turmoil: one of them is a witch riding a broom, another simulates a barrel of good liquor, and so on. This is a design of great spirit and dexterity, and, though caricaturish in tendency, not more so than comports with the subject selected. Mr. Small's picture is named *Autumn Evening, Returning from Work*. It has been a rainy trying day: seven plough horses are crossing an extremely soppy path leading off the high road, their labour finished. The treatment, especially the colour, is broad and full, and its air of natural truth pre-eminent: all is done with vigorous effective decision. We have before us a scrap of English country scenery and life, only less real than the actual thing.

Next to these artists, we may name as figure-painters Mr. Gow, Mr. J. D. Linton, and Miss Thompson. Mr. Gow's principal work, *A Rout*, showing the disorderly flight of a number of troopers, and improvised raw country levies, in the time of one of the Tudor sovereigns, with the rain coming down as the day closes, is executed with

great propriety and nicety; the actions varied and well studied, and the whole subject treated with great intelligence. The defect here is that the style is too precise for such a theme: a certain rapidity of manner, and fusion of constituent parts—of course, stopping short of mere slapdash—would be needed, and these are not given by Mr. Gow. Two other works by this painter, *News of the Old Regiment and Headquarters*, are also highly commendable: the former portrays an old soldier of the Grande Armée laying aside his pipe outside a cabaret, to study a newspaper to which a friend calls his attention. Mr. Linton paints *Tristram and Ysolte, after the Tournament*: the beautiful queen rises to receive her champion, who is ushered into her presence by two of her tire-maidens. Although Tristram's face is somewhat wanting in the look of enterprise and chivalry, this is a work of talent and refinement; the best figure being that of a page who leans against the settee of Ysolte, in an easy swerving pose that has a good deal of vitality. Two untitled companion pictures by the same painter, Nos. 70 and 77—the first representing a seventeenth-century trooper, perhaps a Hollander, lighting his pipe with the tongs, and the second the man's wife in the same interior—are solidly painted. Miss Thompson's designs are chiefly done as studies of vehement action in equestrian, and are striking, even surprising, *tours de force* in this way. In the *Charge, a Reminiscence of the Life-Guards at Wimbledon*, a whole line of chargers are galloping furiously, several of them facing right forward to the spectator; in the *Sketch for a Figure in a Drawing of the Tenth Bengal Lancers at Tent-pegging*, a sepoy, still in full career, reins in his fiery steed. Mr. E. J. Gregory contributes two works of some mark. *Mr. Irving as Charles I.* is a picturesque treatment of the personage, rather than a mere theatrical portrait. *Sir Galahad* is of higher importance, showing the virgin knight on his war-horse, traversing the dark moon-tempered night, with a serpent in his path, and other symbolic accessories. The style has something of Sir John Gilbert, and something also caught from younger painters of a more abstract tendency, such as Mr. Burne Jones. Mr. O. Green sends various paintings, among which we may specify as nicely realised a scene from the comedy of *The Heir at Law*, with Dick exhibiting his new habiliments in the presence of Lord and Lady Duberly. Four of Mr. Tenniel's cartoon-designs for *Punch* (three of them being catalogued as "Original Sketch, finished") may be looked at with some curious interest: as one cannot fail to see from the woodcuts, they are executed with great uniformity and precision of hand. Mr. Absolon should not have obtruded on the public eye attempts so far beyond his range as the two "Studies for Pictures" named *The Raising of Lazarus*; nor are his nine slight affairs in one frame, denominated *Sketching Club*, of any value, whether realisation or suggestion be in demand. Mr. Augustus Bouvier, as author of *The Dance—Le Grazie, ch' eran tre, or son divenute sette*—is responsible for one of the largest pictures in the gallery, and one of the flimsiest.

After that by Mr. Small, about the best landscape is the *Showery Weather on the Coast* of Mr. T. Collier, pleasant and laudable for its sense of space. It presents a large expanse of sands, with the tide rolling in; the scrubby shore-vegetation; a ponderous drift of clouds, with a dim rainbow fading across them; and a few scattered figures. *Spring, Chiseldon on Thames*, is a work of well-studied atmospheric effect, by Mr. W. L. Thomas: the water is traversed by swans: the day is bright in intervals between stormy showers, one more of which is brewing in the leftward sky. *The Devil's Dyke*, by the same painter, with two little boys straying on the big hillside, is also good. Mr. Orrock sends a set of marine subjects, among which *Rain on the Sea* may be specified: there is hardly enough variety in the aspect of his element which he presents to us. *Seaweed*, by Mr. Robert

NOTES FROM ITALY.

Carrick, has a good deal of vigour and unconstrained; and some telling Venetian sketches by the late Mr. Telbin will be inspected with interest. Of such well-known exhibitors as Mr. Hine and Mr. Edmund Warren we need not speak in detail: they send specimens of average value. The *Sea View (Sketch from Nature)*, by Mr. E. H. Fahey, has more uncommonness, being painted evidently from some point of considerable elevation, so that the sea-surface rises like a vast stretch of wall above its green and lawny foreground. The President of the Institute, Mr. Haghe, has an ambitious work, *Ruins in the Roman Forum*, with a musician and numerous other figures: it is an efficient but at the same time an uninspired performance, tending towards the pretentious. The like may be said of two works by Mr. Werner—*Interior of the Church of the Holy Cross near Jerusalem*, and *Interior of the Vestibule of the Holy Sepulchre in Jerusalem, Pilgrims praying*. With this we may mention another interior skilfully handled—the *Staircase in Holland House* of Mr. Hugh Carter.

Mr. Wolf sends three studies of animals—*A Wild Boar's Head*, *A Young Lion*, and *A Dead Lion*; the second, in which the grim leonine nature is forcibly marked, as piercing through and now almost bringing to nought the innocuous good-nature of cubhood, being perhaps the finest, where all three—as sufficiently vouched by the painter's name—are genuinely fine. Mrs. Harrison has some pleasing flower-pieces, as, for instance, the *Roses in Dragon-bowl*; Mrs. Wm. Duffield succeeds less well in floral than in fungoid vegetation, of which the *Study of Scarlet Peziza*, &c., is an example.

THE FLEMISH GALLERY.

THIS is the name given to the premises of Messrs. Everard & Co., 34 King Street, Covent Garden, where a considerable stock of foreign pictures is now on view, not by any means exclusively Flemish. The most interesting work of all, however, does come from Belgium, being by the great painter of Antwerp, Baron Leys. This picture is named *The Declaration*, and was executed in 1863. It represents, on a large scale, a young couple of the earlier part of the seventeenth century, in a Low-country interior. The man is a substantial burgess, a close-thoughted, rather stern personage, very much in earnest just now, and indeed at most times. The damsel is pondering before she gives her reply to his proposal; but one can fairly conjecture that it will be a consent. This is a striking specimen of the master's solidity of character, design, colour, and handling. The Flemish school is further represented by three minor works of Gallait; a small Alfred Stevens, slight enough, but remarkable for its clever treatment of whitish light coming through a window; a fine specimen of Clays, *Early Morning at the Mouth of the Scheldt*, &c. &c.

Of the French pictures, one of the most prominent is the *Romeo and Juliet*, lying dead, by Bertrand, exhibited this year in the Paris Salon: one of those competent productions which "keep their place" in an exhibition room, but about which there is not much to be lauded in detail, whether from an emotional or from an artistic point of view. There are also works by Couture, Huguette, Troyon, Théodore Rousseau, and many others. Madrazo (*Lady in a Mantilla*) is the chief Spanish artist. Geronimo Induno (a very natural painter, but not a *distingué* one in execution, having a style which might be thought studied from Knaus and Thomas Faed in combination), Jacovacci, Boldini (singularly skilled in bright minute touch), and some others, give Italian art a creditable standing here among the other foreign schools.

W. M. ROSSETTI.

MR. THOMAS WOOLNER, A.R.A., has been elected a Royal Academician in the place of the late Mr. J. H. Foley.

THE second exhibition of the "Società Artistica" of Florence, opened on December 1, and the handsome rooms were crowded to excess, chiefly by English visitors. As there was in Florence a want of opportunity for artists to exhibit their works in a profitable manner, and as the old plan of sending them to dealers was very unsatisfactory, while the percentage was very heavy, and the equally old plan of giving fees to lacqueys who brought strangers to their studios was not less objectionable, several artists united, and obtaining ground from the Municipality on favourable conditions, built very handsome studios, while a young Englishman, who took a lead in the arrangements, added a spacious and admirably lighted exhibition room. In this the works of the associated artists are exhibited permanently. That is, the exhibition room is permanently open, while the artists themselves quietly pursue their work in the adjoining studios.

The associates readily admit the works of other artists of merit to the advantages of their exhibition room, and consequently it forms one of the most pleasing assemblages of original and meritorious pictures to be seen in Florence. To prevent the influx of mere idlers, and the inconveniences and damage to property caused by free admission, a small sum is charged at the door to persons not provided with invitations, and the proceeds are divided among charitable institutions.

The exhibition, which opened on the 1st, contains admirable contributions by the Associates Cassioli, Bechi, Vineia, Conti, and Spranger; besides these works, there is a very fine collection of English water-colour drawings of the modern and older school, and a number of the inimitable copies in water-colours from the old masters, by the late Mr. Wheeler. There is also a charming drawing by Gudin, and a clever picture by the Russian marine painter Avvezofski.

The names of Vineia and Conti are now becoming known in England, and so remarkable are their small *genre* pictures for skilful drawing, harmonious colour, and a wonderful dexterity of manipulation, that their popularity is merited. Mr. Spranger's landscapes are pleasing transcripts of nature, chiefly subjects from the scenery of the Gulf of La Spezia.

Among the interesting contents of this exhibition the etchings and drawings of Mr. Bradley play an important part: they are well known in London. Few artists have a finer perception of chiaroscuro, and as an etcher of landscape he stands in the first rank.

On the opening of the exhibition for the season the rooms were crowded as if London, rather than Florence, had been the scene, a satisfactory proof that in associating together and thus providing for a want which existed, these artists have done a wise thing and one which will be of great advantage to themselves and to others.

The claims of the English Academy in Rome merit attention. The French, as is well known, maintain a superb institution in Rome, called the French Academy, and the famous Villa Medici on the Pincian Mount, in which it is established, is the property of the French nation. There an eminent French artist resides, and the celebrated Ingres, Horace Vernet, and other of the heads of the French school have been the presidents in turn of this truly imperial establishment. The travelling students of the French Academy reside in it, and are provided with apartments and everything requisite for study there or wherever they may travel.

England has no such home of art in Rome. An Academy struggles on, supported as best it may by stray contributions of lovers of art and artists, but it is, however, useful in its humble way, such a contrast to the Academy of France that it is both painful and humiliating to mark the difference.

A small sustentation fund has been accumulated, to which the principal contributors have

been his late Majesty George IV., Mr. Hamilton, British Minister at Naples, Sir Thomas Lawrence, the late Duke of Devonshire, and Sir Watkin Williams Wynn, in what may now be called old times. The Royal Academy, London, has contributed four times, and the Royal Scottish Academy has also recognised the usefulness of the institution. At a later period Her Majesty the Queen generously contributed 300*l.*, and various noblemen and gentlemen have added to the funds of the Roman English Academy.

It appears that for a succession of years the affairs of the Academy were indifferently managed, and on the change of Government at Rome, the increase of rents, and the heavy taxation necessitated the closing of the life class. The committee of management, recognising the principle that application should be in the first place made to artists, have done so, and with very satisfactory results. But any institution dependent for aid on subscriptions, is almost sure to sink in the end, and this institution has been of such real use to British art that it deserves public recognition.

The teaching within its walls ought to be systematically conducted, and should embrace not only the study of the human figure, but also other branches of art, together with ornamental design. If this last branch was properly conducted, the utility of the institution might be greatly increased. Rome is the most interesting centre in the world of decorative design, and contains the greatest number of works of this class by the most famous of designers from Raffael downwards.

The establishment of a well-conducted, well-organised School of Art in Rome merits the earnest attention of our Royal Academies, and of the Department of Science and Art. It ought to have a competent director, for the young men who come in considerable numbers to study in Rome, from various parts of the United Kingdom, need guidance and help. Much of their cost and time is literally wasted for want of this guidance and advice at a period of life when it is essential. Other nations provide this for their artists, why does England neglect it? She is awakening to the value of art and its importance to her general welfare, and is now expending liberally in the United Kingdom, but utterly neglects an establishment which might be made as useful to the public interests and those of art as the great Academies of foreign powers.

C. HEATH WILSON.

THE MICHEL ANGELO CENTENARY CELEBRATION.

THE general misunderstanding that seems to prevail in England with regard to the Michel Angelo centenary celebration in Florence, and the important works to which it has given rise, is likely to be confirmed by a most misleading telegram that recently appeared in the papers. Seldom have so many blunders appeared in such a short space as in this extraordinary telegram. We should have warned our readers of its inaccuracy at once, but waited for farther information from Florence, in order to be able with greater certainty to contradict every one of its statements. To begin with, the telegram affirms that "the Director of the Royal Gallery degli Uffizi, has just published a curious work on Michael Angelo, founded upon new documents."

As long ago as September 1, 1873, we gave the programme of the proposed Michel Angelo festival, as then decided upon by the committee, the principal items of it being the new life of the master by the Commendatore Aurelio Gotti, and the publication of the Buonarroti documents. So far from being already published, we are informed by Mr. Heath Wilson, who, as previously announced in the ACADEMY, is preparing the English edition of Gotti's life, the first proof sheets of this work are only now in the hands of the translators. It will appear, not on March 10, as stated, that date having no reference to Michel Angelo, but on March 4, the true anniversary of his birth,

and will be published simultaneously in Italian, French, German, and probably in English. Of the English edition we hope to be able to give further particulars later on. In many respects it will be more important than any of the others.

The "new" documents to which the telegram refers as being "at the disposal of the publisher," were bequeathed by the last Buonarroti with his house and its other contents to the nation, under the condition that the papers in the family archives should not be published. When Hermann Grimm wrote his interesting history of Michel Angelo some years ago, he was not permitted to study these documents. Now, however, the State has wisely determined to disregard the unreasonable restriction under which they were left, and Professor Gotti, who has them in his keeping as Director of the Galleries and Museums of Florence, will publish a selection of the most interesting of them in his life of the master. The remainder will appear in a separate form, edited by the Signor Gaetano Milanese, a learned Italian writer, and at the same time a Bibliography of Michel Angelo, containing notices of all that has been written on or relating to him, will be brought out under the superintendence of the Count Luigi Passerini, Librarian of the National Library in Florence.

The statement that "an exhibition of some of Michael Angelo's works, and copies of all, is being organised," reads as if Michel Angelo's works were to be got simply for the asking. Application has certainly been made to every museum and gallery in Europe for information respecting any work or works it might possess by that master, and a letter from Professor Gotti appeared in the *Times* some months ago, asking for the co-operation of any collectors or others who might be able to send original drawings to the exhibition; still, though every pains has thus been taken to make the collection as complete as possible, it is to be feared that there will be many gaps in it.

For instance, we learn with surprise that the round relief attributed to Michel Angelo, in the possession of our Royal Academy, has never been photographed, and will be unrepresented on the occasion, unless the authorities can make up their minds to spend a few shillings in having it done. Neither will the painted works attributed to him in the National Gallery be represented by photographs unless they are contributed by England.

Our Department of Science and Art at South Kensington replied with the utmost readiness and courtesy to the request of the committee, and forwarded the volume of photographs from the Oxford collection of drawings. The British Museum also has sent information of all it possesses; but there appears to have been some misunderstanding or neglect of the application with some of our English collections that has produced an unfavourable impression on the Florentine authorities. It is to be hoped that this will be speedily removed, for England assuredly would not knowingly fail in contributing her homage to the great Italian.

There will be the more time for doing this, as we are informed that the festival is put off until the autumn of the year. September is now mentioned as the time when it will most likely take place; but this seems a very bad month for such an undertaking. Florence is very hot in September, and visitors have not arrived. Probably this date also will be altered, but the publication of the books before mentioned will not be delayed. These will appear on March 4, 1875, whether the festival takes place or not.

The announcement that the Buonarroti House "will be restored with a view to the circumstance, and decorated with sculptures and frescoes," is in the main correct, certain eminent artists of Florence having offered to restore the *façade* of the house free of all charge; but what is meant by Michel Angelo's "gallery of paintings" in it passes comprehension. There are a number of indifferent paintings in it representing events in

Michel Angelo's life, but these could hardly have belonged to the master himself. The only works of his now preserved in his ancient house are two early reliefs in marble, some studies for the *David*, and an interesting collection of original drawings and studies.

MARY M. HEATON.

ART SALES.

Messrs. CHRISTIE, MANSON AND WOODS sold on the 5th, by order of the Fire Insurance Offices, the salvage pictures of M. José de Murrieta, of Kensington Palace Gardens, saved from the fire at his house last summer. The water-colour drawings sold as follows: Birket Foster, *The Primrose Gatherers*, corner burnt, 106*l.*, and *Constance*, also much burnt, 44*l.*; Hunt, *A Negro Boy*, 48*l.*; Rosa Bonheur, *Landscape with Sheep*, corner burnt, 130*l.*; Fortuny, *Circassian Archer*, 52*l.* 10*s.*, and *Figures on a Terrace*, 63*l.* 2*s.*; Arab Musician and Monkey, corner burnt, 73*l.* 12*s.*; F. Taylor, *A Hunting Party*, 45*l.*, and *Hawking Party*, 104*l.*; Copley Fielding, *On the Sussex Downs*, very much smoked, 200 guineas; W. Muller, *A Rocky River Scene*, 126*l.*; F. Goodall, *Interior at Cairo, with Figures*, 73*l.* 14*s.*; Creswick, *Near Thirsk with Cattle*, 72*l.*, *River Scene*, North Wales, 122*l.*, and *Wooded River Scene*, 195*l.*; W. P. Frith, *Pope and Lady Mary W. Montagu*, 73*l.* 10*s.*, and *Girl with a Rose*, the head of the girl burnt off, 36*l.* 17*s.*; J. Phillip, *Water Carrier of Seville*, injured, 84*l.* 5*s.*; Linnell, *Landscape with Sheep*, 105*l.*; Bonington, *Landscape with Waggon*, right side burnt away, 63*l.* 2*s.*; J. Dupré, *Sea-piece, with French Fishing Boat*, much burnt, 63*l.* 8*s.*; J. Marris, *Coast Scene*, 50 guineas. The sale realised 3,030*l.* 12*s.*

THERE was a small sale of modern paintings on the 27th ult., at the Salle Drouot:—Charles Chaplin, *Girl with a Dove*, 2,925 fr.; N. Diaz, *Forest of Fontainebleau*, 1,130 fr.; Firmin Girard, *The Trio*, scene of the time of Louis XV., 2,900 fr.; Charles Jacque, *Pigs and Poultry*, 1,680 fr.; Perault, *The Meal Shared*, 1,800 fr.; Rudolph Pfuer, *The Bather*, after Falconnet, painting upon porcelain, 1,600 fr.; Troyer, *The Writing Lesson*, 650 fr.; Clésinger, *Head of Christ*, in white marble, 1,000 fr. At a sale on the same day, a bronze console table, supported by two crouching male figures, executed by Crozatier, sold for 2,230 fr.

NOTES AND NEWS.

AN important selection from the prints and drawings of the Howard collection has been made for the British Museum. The Howard collection, of which the first portion was sold in December, 1873, and the second portion in the last week of November of this year (see ACADEMY of last week for an account of the sale), owed its origin to a Mr. Hugh Howard, an Irish gentleman, who made a profession of art, and acquired some reputation among his contemporaries at the beginning of the last century. Horace Walpole gives a short memoir of him in his *Anecdotes of Painting in England*, and Prior celebrated his skill in verse. He appears, however, to have been a very mediocre artist, and would now most certainly have been forgotten had he not employed his time, money, and artistic knowledge in making a valuable collection of prints, books, and medals. At his death, in 1737, this collection passed to his brother, Dr. Robert Howard, Bishop of Elphin, in Ireland, and has remained in Ireland ever since, so that its treasures have been very little known to English connoisseurs until now. As the purchases of the British Museum were made before the sale of the collection by auction, and are not, therefore, included in the catalogues published by Messrs. Sotheby, Wilkinson and Hodge, a short description of them may be of interest.

Among the most important of the drawings may be mentioned:—

1. An elaborate design for a dagger sheath, by

Hans Holbein, most beautifully and finely executed with the brush and Indian ink.

2. A rough study, by Rembrandt, for his well-known etched portrait of Cornelius Sylvius. It is curious to note in this sketch the effect produced by a few rough lines. The eyes appear at first mere blotches, and yet the thought of the man looks out of them. The position of the hand in the etching is indicated in the drawing.

3. A portrait head of an old man with angry eyes and severe cast of countenance, by L. da Vinci.

4. Study of the horse in the well-known equestrian portrait of Charles I., by Vandyck, now in the Louvre.

5. Portrait head, by Lucas van Leyden, with Italian inscription.

6. A portrait of Bernard Baron, the engraver, sitting in his study, by Watteau.

7. 36 ornamental designs by Giulio Romano, a sheet of studies by Carlo Maratti, 91 miscellaneous drawings principally of the Italian schools, a frieze by Cambrasi, studies by Inigo Jones, 20 sketches by H. Howard, the founder of the collection, and 21 examples of masters hitherto unrepresented in the Museum collection.

The most noteworthy among the prints are:—

1. An early Florentine print representing a Dragon seizing a Lion. This is not described in any book of reference, or known in any modern collection; but a drawing of the same subject, by L. da Vinci, exists in the Uffizi; and Mr. G. W. Reid, the Keeper of the Prints in the British Museum, and a learned authority on such subjects, considers it very probable that this print was executed by Leonardo himself. It is etched on a softer metal than copper—probably on silver, a metal often employed by early engravers. A copy of it exists by Zoan Andrea, which is known to collectors.

2. Several fine engravings by Marc Antonio, including *The Queen of Sheba* in an early state; a Nativity after Francia, executed before Marc Antonio went to Rome, and in such an early state of the plate that the nimbus has not been put in over the heads of the Virgin and St. Joseph; St. Apollonia, and a curious counter-proof of an engraving representing three female figures holding up a basket, called *La Cassolette*. This is the only instance known of this mode of taking impressions by M. Antonio.

3. Two friezes by Bartel Beham, extremely rare; portrait by Aldegrever; and several other examples of the little masters of Germany.

Besides these works that we have examined for ourselves, the British Museum has acquired 12 prints by masters whose works are described in the 5th and 6th vols. of Bartsch; 11 prints described in the 7th, 8th, and 9th vols.; 41 in the 12th vol.; 30 in the 14th vol.; 84 in the 15th vol.; 115 in the 16th vol.; 130 in the 17th vol.; 56 in the 18th vol.; 78 in the 19th vol.; 26 in the 20th vol.; and 35 in the 21st vol.; 173 miscellaneous Italian etchings; 107 French and English etchings; and many others that want of space prevents us from enumerating; so that it will be seen that a goodly selection has been made for the nation from the now-dispersed Howard Collection.

In the current number of the *Zeitschrift für bildende Kunst*, Dr. Woltmann continues his critique on the Suermondt collection, a collection that Germany is naturally proud of having secured for her National Gallery. The paintings of the Flemish and Dutch schools are now under review, and we have in illustration of them a fairly good etching by Ch. Courtez of a painting by Terburg representing a love-lorn young gentleman indulging in a meditative pipe, and a farm-house scene by Jan van der Meer etched by L. Flameng. The other articles of the number are a continuation of Veit Valentin's philosophical study of dress and fashion, in which he comes to the conclusion that although Frenchmen must be allowed

to hold the first rank in respect to taste, especially in their cookery, yet that Germany is undoubtedly the land of art; an account of the recent architectural efforts in Stuttgart, by P. F. Krell; and a learned review, entitled *Nachlese zu Carsten's Werken*, of H. Riepel's "Carsten and his Works," of which a second volume has lately been put forth.

ALL the galleries of the Louvre are at last reopened to the public. The newly-installed pictures from the Luxembourg have been placed in the upper galleries.

THE design of M. Abadie for the Church of the Sacred Heart at Montmartre was definitively adopted at the last meeting of the Artistic Commission, so that the party in favour of domes has finally triumphed. M. Abadie has, however, been obliged to relinquish one feature of his plan—the high square bell-tower that he had placed at one of the angles of the building. This was considered to interfere with the general effect, and the architect has consented to suppress it. We may remind our readers that M. Ph. Burty gave an amusing and detailed account of the various rival plans for the erection of this ambitious edifice, in the ACADEMY of August 8, 1874.

MM. E. PLON ET CIE. have just published a second volume of M. Bertail's sketches with pen and pencil, entitled *La Comédie de notre Temps*. The comedy is divided into four acts, representing childhood, youth, middle age, and old age, and the various comic scenes enacted on life's stage by the various players of our time are cleverly depicted and satirised. The book is well got up, and contains 1,000 illustrations.

M. CHARLES CLÉMENT, writing in the *Débats*, gives a sympathetic little account of Emile Rousseaux, the engraver, who died in Paris, a few days ago, aged forty-three years. Among modern line engravers he was one of the cleverest. He was an excellent designer, and he had a quality specially necessary to a line engraver if his work is to be good—inexhaustible patience. *Le jeune Homme coiffé d'une Toque noire*, from the picture at the Louvre, Paul Delaroche's *Martyre*, and a *Portrait of Madame de Sévigné*, are to be reckoned as perhaps the best of his works. To some extent, he shared with some greater fellow workers the characteristic of bettering much in some things he reproduced. Rousseaux was born at Abbeville, of a family of clever artisans. He has died regretted by many friends, and just at a time when he was beginning to reap the rewards of success.

At the general meeting of the Cambridge Antiquarian Society on Monday, Nov. 23, 1874, Professor C. O. Barrington in the Chair, the following objects were exhibited:—

By Mr. Foster:—

"(1) A silver crown piece of George III.: *rev.* St. George and dragon, with *PISTRVCCI* engraved on the exergue of each side: *date* 1820.

"(2) A gold pattern crown of Queen Victoria: *rev.* rose, shamrock and thistle: *date* 1848.

"(3) A pair of leathern dress gloves, richly brocaded about the wrists; long in possession of the Ashby family at Naseby, they are said with great probability to have belonged to Charles I.; certainly they are good examples of the fashion of his time.

"(4) Three brocaded purses of the same period.

"(5) A pincushion with ribbon for suspension, both inwoven continuously with *GOD BLESS F.C. AND DOWN WITH THE R.V.M.P.*"

By Mr. Lewis:—

"(1) A bronze figure of Mercury as Messenger of Jove. He is furnished with his winged cap (*petasus*) and sandals (*talaria*). In his left hand is the customary purse (*crumena*), and the right hand holds a broken rod, which when entire was doubtless a *caduceus*. The statuette is of Gallo-Roman style, and about two inches in length. It was found last summer in the neighbourhood of Barton, Cambs.

"(2) Two intaglio gems, a sard and an amethyst,

the former giving Mercury at full length in a style precisely similar to that of the above-mentioned bronze statuette, the latter showing his bust wearing a tortoise-shaped cap as 'Parent of the Lyre.'

THE STAGE.

SUPPLEMENTAL NOTES ON IRVING'S HAMLET.

THE thirtieth performance of any stage play is sure to differ a good deal from its first, for even those actors who may be roughly classed as of the school of Kemble—followers of an accurate and preconceived method—much more, of course those others who follow Kean and the impulse of the time—change, at least gradually and surely, in their lesser effects, if not in the effects on which they most rely; so much so that it is even possible for a playgoer to be satisfied with a performance on the first night, and dissatisfied on the thirtieth or fiftieth. A few modifications are to be noticed in Mr. Irving's Hamlet in the interval that has elapsed between his first and thirtieth performance. Some of them may perhaps be due to the suggestions of criticism, and some to changes here and there in his own judgment on minor things, and some are no doubt unconscious modifications, which would have no importance were it not very curious to remark how they belie some of the subtleties which it is always very tempting to perceive in the performance of a great actor. I was told, for instance, within an hour of seeing Mr. Irving last Monday, to notice one little eloquent detail in particular—the tremulous handling and fidgeting with his neck chain which marked the moment of his enquiry of the players whether they could insert "a dozen or fifteen lines"—that moment being thus suggested and emphasised as the first in which Hamlet made active endeavour to carry out the "purpose," afterwards indeed "almost blunted" and now at first so unwillingly begun. And I remember myself to have noticed this on the first night, and to have admired it. But now, on the thirtieth, it was not there at all.

A second visit gives one advantage and one disadvantage. It is always enough on the first occasion to follow Hamlet himself. You have hardly the opportunity to notice with any keenness the merits or failings of the rest. And on the first night this certainly favoured the pleasantness of the impression produced. One rested and looked elsewhere while the King was mouthing his pious soliloquy in his closet: one omitted to notice that Horatio was by no means obviously so very fine a fellow as Hamlet was good enough to declare; and one was so much impressed with the apparition of the Ghost, and with his sustained monotony, that one forgot to remark that he mentions with absolutely equal solemnity the fact of the "most foul murder," and the somewhat minor circumstance that when in the flesh he generally had a nap in his orchard every afternoon. Mr. Mead announces to Hamlet this interesting "custom,"—"my custom always of an afternoon"—not in the least parenthetically, or incidentally, but with a solemnity with which a nap after lunch was never previously announced.

To see these things, and to be worried or amused by them, is the disadvantage of a second visit. Its advantage is that one can note little point after point in Mr. Irving's own performance, which at first, by its very richness, escaped one; for his performance from end to end is absolutely charged and laden with a fulness of meaning. To speak of two or three small things, he gives what I suppose to be a new reading to the lines—

"I'll call thee, Hamlet,
King, Father, Royal Dane."

Edmund Kean, they say, made a great point by the tremble in his voice at "Father," but Mr. Irving makes Father the last word of the invocation—the climax—and carries the words "Royal

Dane" (which of course do nothing but repeat "King") over to the next sentence, reading it:—

"I'll call thee Hamlet,
King, Father. . . . Royal Dane, O! answer me."

Notice, again, the half-indulgent yet half-jeering sigh of relief which follows his hearing Polonius's commendation of his praise of the little speech which he delivers as an example to the players. Here and elsewhere the actor suggests to you that among all great troubles, there is always this nagging little one, of the "tedious old fool's" presence and commendation. Many things weigh upon Hamlet: one thing worries him—to be praised by Polonius.

Notice, again, the difference between Mr. Irving's conduct and those of his comrades as he is listening to the first recitation by the player—that recitation which must indeed have been a good one, since founded upon it was Hamlet's own self-contempt:—

"O! what a rogue and peasant slave am I!
Is it not monstrous that this player here,
But in a fiction, in a dream of passion
Could force his soul so to his own conceit
That from her working all his visage wann'd,
Tears in his eyes, distraction in 's aspect,
A broken voice and his whole function suiting
With forms to his conceit? and all for nothing!
For Hecuba!
What's Hecuba to him, or he to Hecuba,
That he should weep for her? *What would he do
Had he the motive and the cue for passion
That I have?*"

No one else in the small audience is at all struck—as struck they should be—with the player's art. Nor, indeed, does the player's art, as shown at the Lyceum (where the small Court gathers to see the play), at all correspond with Hamlet's account of it, but Mr. Irving sitting in his chair, is seemingly struck with it—watches it not only minutely, but with wonder and admiration—and this makes natural, as nothing else could do, the subsequent praise of it.

One more point,—the death of Polonius. It was noticed, with some dissatisfaction, that Mr. Irving treated, as was thought, too lightly his discovery that behind the arras there now lay dead, Polonius, not the King. But probably he is right after all in treating the old man's death quite lightly at first. Hamlet is pre-occupied: he hardly understands it: he is foiled in his task: the one thing to be done is *not* done, and what is done is a chance of no moment. Then comes, with great significance, the after reference to it. Hamlet is going away with softer words to his mother:—

"Once more, good night:
And when you are desirous to be bless'd
I'll blessing beg of you."

He steps back, stops a moment with an afterthought—the dead Polonius. And with a new regretful gravity:—

"For this same lord,
I do repent."

FREDERICK WEDMORE.

MR. WATTS PHILLIPS, the well-known dramatist, died last week, quite prematurely. He was forty-five years old, and his death leaves a blank among a very small circle of writers who, if they have not contributed any great or graceful addition to the permanent literature of the stage, have done some service in satisfying a not too critical public with work neither vulgar nor very trivial. The *Dead Heart* was Mr. Watts Phillips' chief success. It set a certain fashion in melodrama, and was more or less successfully copied, during succeeding years, both by other writers and by the author himself. Mr. Phillips, up to the time of his death, was still a favourite with his own large public: his drama of *Lost in London*, notable for the pathetic performance of Mr. Emery, and for the opportunity adroitly afforded for this per-

formance, is, at the moment of our writing, drawing many people to the Princess's theatre.

Romulus and Remus, a burlesque, in which Messrs. James and Thorne were amusing some two or three years ago, as the representatives of the twins, has just been revived at the Vaudeville theatre, its original home. Messrs. James and Thorne continue to be funny in the piece, which is presented only after the performance of a good comedy.

We hear that Mr. Walter Thornbury is editing Mr. Buckstone's Autobiography.

NEXT week has been selected for some ambitious performances at Drury Lane. Mr. James Anderson takes a benefit there on Monday, and plays Falstaff in the *Merry Wives of Windsor*. On Tuesday there will be Mr. Creswick's Benefit, when he will enact *Hamlet*,—wearing his "rue with a difference." And on Wednesday, the large public of Drury Lane, which becomes "legitimate" in its tastes on the eve of Christmas, preparatory to the hardly wilder excesses of the Pantomime, will refresh itself with *Romeo and Juliet*; the heroine being represented by Miss Wallis.

The Prayer in the Storm—a piece worthy of the palmiest days of Adelphi Melodrama—has been revived at the theatre to which it rightly belongs. With it, Miss Geneviève Ward returns to the Adelphi, where she and the piece were first successful together nearly a year ago.

The Love Chase was played at the Crystal Palace on Thursday, as the typical work of Sheridan Knowles. The heroine—Constance—was represented by Miss Fowler.

THE largest part of the excellent Gaiety orchestra, conducted by Herr Meyer Lutz, goes to the Holborn Amphitheatre at Christmas, when *Cinderella*, with music by Rossini "and others," will be produced under Mr. John Hollingshead's management.

AMONG the articles in the current number of *Le Théâtre*, there is a very interesting one by M. F. de Marescot on the Théâtre du Marais as it was in the last century. Beaumarchais was its guiding spirit, and the excellent composition of its *troupe* enabled it soon to be popular. But its vogue did not last very long. The chief interest attaching to it—and that is a peculiar one—is due to its having been the scene of the early production of much of Beaumarchais' most remarkable work. Nevertheless, at the time Beaumarchais' exclusive direction of it soon told against its success. "Celui-ci," writes M. de Marescot, "revenant avec une tendresse exagérée vers ses premières œuvres dramatiques, marquées au coin d'une évidente faiblesse, eut le tort de faire représenter, sur la scène du Marais, non seulement *Eugénie*, mais encore *Les Deux Amis*." *La Folle Journée*, was, however, peculiarly successful. *Le Mariage de Figaro*, retouched as he had retouched *Tartare*, had almost the effect of a novelty; but it was to no purpose. About 1792 fortune finally abandoned the little playhouse in the Rue Culture-Sainte-Catherine. "Des petits bourgeois et les dévots qui habitaient le quartier du Marais, ne fréquentaient pas le théâtre. Les jours sinistres de la Révolution virent désertier ce quartier jadis si peuplé." The theatre vegetated, under Brazier, till 1807, when a decree of Napoleon's suppressed it along with several other of the minor playhouses. Any one now going down the street, which has been renamed Rue de la Sévigné, may see its site where a big bath-house stands, and the pilasters which formed part of its exterior.

M. JULES CLARETIE, the critic, is an active dramatist. He has arranged, for M. Castellano's theatre, a drama founded on his story *Les Muscadins*. The actor Laurent will act its chief character. Besides this, M. Claretie has had accepted

at the Théâtre de Cluny a four-act comedy called *Le Lest*. The piece has been written for Laferrière, who will play the part of an old captain in it.

M. GEORGES RICHARD, an actor well known at the Odéon, and author of the play *Nos Enfants*, has written for the Théâtre de Cluny a piece founded on M. Emile Gaboriau's singular novel *La Vie Infernale*. It will be produced almost immediately.

THE *Matinées* at the Gaité, in Paris, have recommenced for the season; and on the first day there was recited by Porel a prologue written for the occasion by François Coppée,—verses in which the poet appropriately sings the glory of the language and its literature. The verses are not only fine lines, but are charged with strong and deep patriotism. Three of them were forbidden by the authorities of Paris, as likely to excite too much the auditory.

La Haine, Sardou's latest piece, has at length been brought out, after an endless series of rehearsals and delays, at M. Offenbach's theatre. *La Haine* is the production of a man who has by no means as yet lost the force of his imagination, though much of his later work has been careless and trifling. The new drama has audacious and powerfully conceived situations which, however, the treatment of the story hardly justifies, as it might do. It has been well pointed out that the action presents two remarkable points, and in indicating these we shall tell all that is necessary of the story. The scene passes at Siena, when the strife between Guelph and Ghibelline is running high. Orso, a man of the people, has been insulted at a public festival, by a patrician girl, Cordelia Saracini. He has sworn to be revenged. At the head of the Guelph party in the town, he makes a violent attack upon Cordelia's palace, and as her brothers and their men are fighting elsewhere, he can enter, and in the dead of night ravishes Cordelia, who sees no face, but hears a voice that she can afterwards recognise. This voice she hears again, by chance, another day, and she follows Orso, to stab him, and succeeds in her vengeance, but does not know whether or no the wound given was a fatal one. Later on, there is a combat between the two parties, and Cordelia, going upon the field of battle, when the battle is over, hears Orso's voice, as one of the wounded, calling for water. She cannot refuse this now, in his suffering; she gives him to drink, takes his head on her knees, sees his face for the first time, and hate is turned to love. That is the first point, which were it more naturally led up to—rendered more probable by previous exposition of Cordelia's character—would be immensely striking. The action proceeds. The Emperor of Germany, profiting by the dissensions of the town, lays siege to it. Meanwhile Orso is transformed by Cordelia's love; he is determined to be worthy to ask her hand, and he will endeavour to weld together the two parties of the town in defence against the common enemy. He risks his all on the accomplishment of this project. "Hitherto," says Cordelia, "you have been but a bandit—be a hero, now!" And that is the second point—the culminating point in the piece, or rather, after all, a new point of departure, for the piece, of course, does not end here. It ends tragically—a love so begun could evidently end no otherwise. It is full of situations that would suit serious opera, full of opportunities for effective declamation and scenic display. It will draw a crowd to the theatre for many a week; but, despite its eloquent passages, it will never come to be reckoned among the lasting contributions to stage literature. As for the acting, Lafontaine, who plays the part of Orso, was not on the first night possessed of all his powers, but he is an actor who, when in fine condition, can hardly disappoint. There is, perhaps, too constant a tension, both for actress and audience, in the rôle of Cordelia, played by Mlle. Lia Félix with great impulse and force. Mlle. Marie Laurent plays a long part, and a part

abounding in horrors; but how little it has to do with the main theme of the drama may be judged from the fact that in telling the main theme, we have not had occasion to speak of the character she plays. "Too slight a picture, in too great a frame," is the judgment passed by one of its best critics on a piece which will nevertheless command the attention of a great public for some time to come.

A COMEDY, in four acts, by a little known writer, M. Poupart Davyl, has just been given at the Odéon, with a success obtained by its power to move and amuse, and in no wise owing to the efforts of scenic artist or costume-maker.

THE managers of all the German theatres have received a four-act comedy, named *Recept gegen Hausfreunde* by an author with a long Spanish name, which no doubt is a pseudonym—the real name of the author—"on dit"—is no other than Ludwig II., King of Bavaria!

THE Gymnase-drama *La Marquise*, by Adolphe Belot, was produced with good success last week at the Vienna Stadttheater.

MUSIC.

AT last Saturday's concert at the Crystal Palace, the programme was chiefly composed of the works of Mozart, the day being the 83rd anniversary of the composer's death. The most important novelty brought forward was his violin concerto in D, the fourth of six such works which he produced. In its general style the piece bears considerable resemblance to his pianoforte concertos, and though making far less demands upon the soloist than more modern compositions—such, for instance, as the concertos of Mendelssohn and Spohr—is full of genuine Mozartean grace and tenderness. The andante is one of those exquisite streams of melody in which Mozart has never been surpassed, and the final rondo is remarkable for the changes of time and rhythm which prevail in it, and which remind us of the finale of the composer's great sonata for piano and violin in the same key as the present work. The solo part was excellently played by M. Sainton, who introduced the cadenzas written for the concerto by the late Ferdinand David. The other pieces by Mozart given at this concert were the "Jupiter" symphony, which was splendidly given by the band, the overture to *Figaro*, and the song from the same opera, "Vedrò mentr'io sospiro," sung by Mr. Santley. The only other item of the programme calling for special notice was Mr. G. A. Macfarren's fine "Festival Overture," composed for and produced at the recent Liverpool Festival. As mentioned in our report of the Festival, it on that occasion received very imperfect justice. On Saturday it was played in a manner worthy alike of its merits and of the Crystal Palace Orchestra, and appreciated accordingly. It will certainly, we think, rank amongst its composer's most successful works.

LAST Monday's Popular Concert brought forward, for the first time at St. James's Hall, Haydn's quartett in C, Op. 20, No. 2—a work which is, in some respects, one of the most remarkable of the old master's eighty-three. While possessing perhaps less absolute melodious charm than some of its companions, it shows a boldness of harmonic treatment truly astonishing for the time at which it was written. It was played, it is needless to say how, by Mlle. Norman-Néruda and Messrs. Ries, Zerbini, and Piatti. Signor Piatti played a violoncello sonata by Marcello, in his own unrivalled style. The pianist was Mr. Charles Hallé, who, besides giving as his solo Beethoven's Sonata in A flat, Op. 110, joined Mlle. Norman-Néruda and Signor Piatti in Friedrich Gernsheim's interesting trio in F, which was introduced to the English public last season for the first time at one of Mr. Hallé's recitals.

THE most important works produced at the Albert Hall Concerts during the past week have been,—on Tuesday (English night) Bennett's overture to *Paradise and the Peri* (one of his most charming compositions), G. A. Macfarren's Festival Overture and E. Prout's Organ Concerto, the solo part excellently played by Dr. Stainer; on Wednesday, Schubert's B minor symphony, and Beethoven's seldom heard "Triple Concerto" for piano, violin and violoncello; on Thursday, Bach's sublime *Passion according to Matthew*. Last night, Liszt's Second Concerto, recently given at the Crystal Palace, was announced, with Mr. Walter Bache as pianist; and, in addition to Wagner's *Rienzi* overture, and a selection from *Tannhäuser*, a portion of Rheinberger's "Wallenstein" symphony was included in the programme.

A FESTIVAL is announced to take place at Rouen on the 15th inst., in commemoration of the centenary of the birth of Boieldieu, who saw the light in that town on December 15, 1774.

Mr. F. BRUCKMANN, of Henrietta Street, has just published a most charming little book, which will be found at the present season admirably suited for an elegant Christmas or New Year's gift. It is entitled *Gallery of German Composers*, and consists of twelve exquisitely finished photographs, with illustrative letter-press, of the principal German musicians. Those given are Bach, Handel, Gluck, Haydn, Mozart, Beethoven, Schubert, Weber, Mendelssohn, Schumann, Meyerbeer, and Wagner. The portraits are taken from the best sources, and are admirable likenesses. The biographical notices are from the pen of Dr. E. F. Rimbault, and while professing to be nothing more than sketches, are extremely well done. The whole "get up" of the volume, as regards paper, printing, and binding, is perfection, and the work can be most warmly recommended.

THE lectures on Bach, which Dr. Spitta has recently delivered at the Gewandhaus in Leipzig, are to be published by Messrs. Breitkopf and Härtel.

OUR readers will, we are sure, share our regret at learning, on the authority of the *Musikalisches Wochenblatt*, that the rheumatic attack which for some time past has prevented Mme. Schumann from appearing in public, has not been removed by her recent visit to the baths at Teplitz, and that there is no prospect of her visiting this country, or indeed playing at concerts at all, during the present season.

A CORRESPONDENT writes from Pesth: "Herr Glatz, one of the 'Nibelungen,' to whom the part of Siegfried is assigned at the production of Richard Wagner's tetralogy at Bayreuth, has made a very successful first public appearance at the first of Hans Richter's Orchestral Concerts. He sang Walther von Stolzing's 'Werbeld' ('Morgenlich leuchtend'), from the *Meistersinger*, and the really extraordinary power and richness of his organ produced a great effect on the whole audience. This marvellous voice, however, besides his 'Nibelungen figure,' is the only good quality to be found in him at present, as his voice has until lately been totally neglected. Our Capellmeister, Hans Richter, who has 'discovered' him, is his tutor; and so it is to be hoped that Herr Glatz will, studying under so excellent authority, realise the great expectations which Richard Wagner, who heard him last summer, has himself formed."

WE learn from Munich that Franz Lachner conducted a concert of the Musikalische Akademie there on the 18th of last month, at which he produced a new "Ball-Suite" in six movements. The new "Suite" is, like all Lachner's compositions, extremely effective and gorgeously rich in scoring, although it has the faults of all its predecessors from the same pen—it is not fresh in invention. The success was really enormous.

DR. EDUARD HANSLICK, one of the most prominent German critics, explains the small success of the revival of Gluck's *Iphigenie in Aulis* (November 21), at the Vienna Opera, in the following manner:—

"By Mozart—not to speak of Beethoven, Weber, and more recent composers—we have been used to such rich and lively colours in operatic music, that the sight of white marble can but rarely satisfy us, and then only by the aid of historic interest. Between *Iphigenie in Aulis* and *Don Juan* (which was composed but thirteen years later) there lies an abyss which can scarcely be passed now-a-days. Gluck's music is as dramatic as the modest means of the ante-Mozartean time and the somewhat heavy inventive powers of Gluck permitted. It is true, noble, sublime—but too wanting in charm, too monotonous for our time. Not even with Richard Wagner's excellent adaptation (he added two of the most beautiful scenes: Iphigenie's parting in the second act, and the finale) could Gluck's work make a great success. Only the great scena and aria of Agamemnon (splendidly sung by Beck), produced a more vivid impression."

According to Dr. Hanslick, the two principal parts (Agamemnon and Klytemnestra) were "grandly" given by Herr Beck and Frau Dustmann, whilst the other parts found efficient exponents in Fräulein Dillner, and Herren Labatt, Scaria, Hablawetz, and Lay.

IN Hellmesberger's Quartett-Soirées in Vienna a new pianoforte and violin sonata by Goldmark (who abroad grows more and more in appreciation the more his works are performed) was produced with enormous success; it was magnificently played by Professor Anton Door and Director Hellmesberger.

HEINRICH SONTHEIM has reappeared on the operatic stage at Stuttgart. At his first appearance he sang the scena with the "Revenge" aria from *Othello* and the Brigand aria from *Fra Diavolo*. According to local critics he has entirely recovered his fine voice.

JOHANN STRAUSS completed last week the second act of a new comic opera, which will be performed at the Theater an der Wien on or before January 15, 1875. The third act is also nearly finished, and the title is to be *Cagliostro in Wien*. The libretto, from the pen of Herren Zell and Genée, is intended to represent social life in Vienna about 1783.

THE statement that Herr Otto Dessoff was appointed Director of the future South Kensington National Academy of Music was erroneous, according to the source from which we took it.

THE Vienna "Sing-Academie" (conductor, Johannes Brahms) will perform in their first concert this season several interesting compositions by old masters, which have almost the charm of novelties. Amongst others there is a Hymn by Friedemann Bach, which is entirely unknown to the public, as it has only lately been found in Vienna by Professor Weinwurm.

THE Nestor of musicians in Hamburg, Herr Friedrich Wilhelm Grund, died at the end of last month, aged eighty-three. His name was widely spread, through his compositions, some of which—for instance, the oratorio *Auferstehung und Himmelfahrt Jesu*, two quartets, and especially the pianoforte Etudes—have met with great appreciation even beyond Germany.

MDME. ESSIOFF is now in St. Petersburg, where she intends to give a series of pianoforte recitals. A concert-grand, from the factory of the celebrated makers Messrs. Steinway and Sons, New York, has been specially ordered for these recitals.

POSTSCRIPT.

SOME little time ago Signor D. Ladislao de Velasco, correspondent of the Academy of History at Madrid, presented to that institution a Spanish MS., long preserved in his family and held in great estimation by it, which proved upon examination to be a very curious contemporary chronicle of Henry VIII. of England. We are glad to hear that the entire work has just been published in Madrid by Alfonso Duran, under the editorship of the Marqués de Molins. The full title of the volume runs thus—*Crónica del Rey Enrico Otavo de Inglaterra, escrita por un Autor coetáneo, y ahora por primera vez impresa é ilustrada, con introducción, notas y apéndices.*

DR. MILLEN COUGHTREY, formerly Assistant Lecturer on Anatomy in the Liverpool Medical School, has been elected Professor of Anatomy and Physiology in the University of Otago, New Zealand.

STANDARD BOOK FOR EVERY HOUSEHOLD.
WARNE'S POPULAR COOKERY-BOOKS,
10s. 6d., 7s. 6d., 3s. 6d., 2s. 6d., 1s. 6d., 1s.
7s. 6d.—MODEL COOKERY AND HOUSEKEEPING BOOK.
Receipts, numerous Woodcut Illustrations, and Coloured Illustrations of nearly 200 distinct subjects.

10s. 6d.—Ditto, ditto, half-morocco.
2s. 6d.—EVERY-DAY COOKERY-BOOK, with nearly 2,000 Receipts. Woodcut and Coloured Illustrations.
3s. 6d.—Ditto, ditto, half-bound.
1s. 6d.—WARNE'S POPULAR COOKERY AND HOUSEKEEPING BOOK. Nearly 800 Receipts and Coloured Illustrations.
1s. 6d.—Ditto, ditto, half-bound.

FREDERICK WARNE & Co., Bedford Street, Strand.
A COMPANION VOLUME TO MODEL COOKERY.
WARNE'S MODERN HOUSEHOLDER,
price 7s. 6d. (post free 8s. 3d.); 732 pp. A Manual of Domestic Economy in all its branches. With 16 pages of Original Illustrations, printed in Colours, and numerous Woodcut Illustrations. The information embraces every conceivable branch of the science of comfort in domestic management.
Frederick Warne & Co., Bedford Street, Strand.

Price One Shilling, postage 2d.
WARNE'S VICTORIA PENNY TOY-BOOKS.—A Packet of Twelve Books, the Plates printed in Colours, and letterpress descriptions.
The sale of upwards of two millions attests the extraordinary popularity and demand for the Victoria Penny Toy Books.
Sold by all Booksellers and Toy Shops.
FREDERICK WARNE & Co., Bedford Street, Strand.

WARNE'S NURSERY LITERATURE.
The Celebrated AUNT LOUISA'S TOY BOOKS; Fifty Varieties. Price 1s. each; or Mounted on Linen, 2s. All Printed in the Oil Colour Process.
AUNT LOUISA'S SUNDAY BOOKS. In the same style as "Aunt Louisa's Toy Books."
WARNE'S PICTURE PUZZLE TOY BOOKS. Full of Coloured Illustrations; will occupy the attention of children for days, and form an endless amount of instruction and amusement.
FREDERICK WARNE & Co., Bedford Street, Strand.

SATURDAY, DECEMBER 19, 1874.

No. 137, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Greville Memoirs. A Journal of the Reigns of King George IV. and King William IV. By the late Charles C. F. Greville, Esq., Clerk of the Council to those Sovereigns. Edited by Henry Reeve, Registrar of the Privy Council. (London: Longmans & Co., 1874.)

THE sensation created by these Memoirs on their first appearance was not out of proportion to their real interest. They relate to a period of our history second only in importance to the Revolution of 1688: they portray manners which have now disappeared from society, yet have disappeared so recently that middle-aged men can recollect them; and they concern the conduct of very eminent persons, of whom some are still living, while of others the memory is so fresh that they still seem almost to be contemporaneous. Mr. Charles Greville was Clerk of the Council from 1821 to 1861. Precluded by his position from taking any active part in politics, he watched them with the eye of a critical and interested observer; and as he had access to the best society, so he seems to have conversed unreservedly with the greatest personages of the period, and to have enjoyed the confidence of the leading statesmen of all parties. For himself, we are to suppose that he was neither a Whig nor a Tory: but in the broadest sense of the term, he was a genuine Conservative. He tells us in so many words that he cares very little who is in or out of office, "provided 'the thing,' as Cobbett calls it, is kept going:" the "thing" being, of course, the existing system of the country, with all its institutions, distinctions, and traditions. But as, probably, there was not a single Whig nobleman or gentleman in England forty years ago who was not just as anxious to keep the thing going as himself, this opinion would have been no bar to his intimacy with Lord Melbourne's colleagues. However, it is waste of words to try to prove probable what we know already to be certain. The extent of Mr. Greville's information was limited only by the extent of his curiosity; and the result is, that a mine so rich in that kind of matter which is half gossip, half history, as lies beneath the boards of these volumes has rarely been opened to the public. It is said that Mr. Greville abused the opportunities he enjoyed, and had no right to make notes of everything that was told him in confidence; likewise that Mr. Reeve ought not to have published these Memoirs till a longer interval had elapsed, when all chance of wounding the feelings of surviving relatives was past.

On these points it is impossible to lay down any rule. What hurts one person's feelings will glance harmlessly from another's. While, if men in the position of Mr. Greville are not to take notes of what they hear, one of the most useful and important branches of modern literature must in future be tabooed. Of course we expect some discretion from both diarist and editor; and we think that in some few instances Mr. Reeve and Mr. Greville have shown a want of it. Certain references, for instance, to the Royal family might well have been omitted; while of others, affecting less exalted but still distinguished individuals, good taste and good feeling would perhaps have dictated the suppression. But still, on the whole, offences of this kind are few and far between, and certainly do not justify the reproaches which by some contemporary critics have been hurled at the head of Mr. Reeve. Still less reasonable, as it seems to us, are the complaints which have been made of Mr. Greville's inconsistencies, and the contradictions which occur in one page of opinions recorded in another. But a journal or note-book which did not contain such contradictions, which had been weeded and digested into one harmonious whole, would no longer be a journal but a history. That they rob the journal of all value as a contribution to history is entirely untrue. The historian has to take up such materials and make the best he can of them. These very contributions and inconsistencies are a tribute to the diarist's sincerity, and show that he wrote to establish no foregone conclusion. The impressions made on his mind from day to day, often of necessity varying with the circumstances of the hour, or with the last conversations which he shared, is what we expect to find recorded in his pages. And the future historian is better able to trace the character of a public man, or of some great political event, by the aid of these unconnected jottings, than he would be by general conclusions, in which the diarist, without giving his data, had endeavoured to reconcile them with each other.

The interest of these volumes may be divided into four heads—Political, Social, Literary, and Personal. Under the first come all Mr. Greville's reminiscences of Canning and Castlereagh, of Roman Catholic Emancipation and Parliamentary Reform, of the break-up of the Whig Cabinet, the abortive effort of King William to reinstate the Tories, and the great coalition between the Whigs, Radicals, and Repealers, which proved too strong for him. It is characteristic of all lookers-on to see the faults of both sides more clearly than the merits of either. And Mr. Greville was an incorrigible grumbler. Nothing that was done in his day was done right. Roman Catholic emancipation ought to have been granted; but not as it was. It was difficult to say which was the worse—the Reform Bill of 1832, or the mode in which it was resisted. He is really puzzled what to wish for, "that is, for the success of which party," being equally disgusted with both. He wants a new man, some impossible piece of political perfection,—

"who will rally round him the temperate and moderate of both parties—men unfettered by prejudices, connexions, and above all by pledges, ex-

pressed or implied, and who can and will address themselves to the present state and real wants of the country, neither terrified into concession by the bullying of the press and the rant of public meetings and associations, nor fondly lingering over bygone systems of government and law."

After the Reform Bill, sometimes it is Peel who he thinks is the man of the future, but then Peel is so selfish, unamiable, and ambitious, that he wishes there was somebody else. Sometimes he speaks very highly of Mr. Stanley (the late Lord Derby), and on one occasion describes him as "the greatest orator and statesman of the day." Yet Mr. Stanley won't suit him after all. He has various drawbacks which disqualify him for the post of leader. This kind of morbid discontented criticism is, as we have said, characteristic of a man condemned to political inaction while taking a deep interest in politics. It is the style in which one often hears very clever men talk of public affairs who are remote from the scene of action, and have no practical acquaintance with them. Practical men understand that there is no room for such fastidiousness in real business; and that while you are waiting for the admirable Crichton who comes up to your ideal, the opportunity for action is lost. Critics may sigh in their closets over the degeneracy of modern statesmen, and amuse themselves with visions of imaginary excellence. But the business of the State must be conducted, and sensible men will not detract from the usefulness of statesmen by constantly carping at imperfections which, in some form or another, they know it is impossible to escape from. But Mr. Greville's business as a diarist seems to have been one of universal accusation. He quotes favourable opinions of the various leading men of the time, but seldom, if ever, expresses one of his own. He gives us, for instance, Lady Granville's and Talleyrand's opinions of Lord Palmerston, which were extremely complimentary: but when he speaks of him in the first person, it is with absolute bitterness. He does nothing in his office. He keeps our ambassadors for months without instructions.

"He spends his time in making love to Miss P., whom he takes to the House of Commons to hear speeches which he does not make, and where he exhibits his conquest, and certainly it is the best of his exploits—but what a successor of Canning, whom he affects to imitate! What would be Canning's indignation if he could look from his grave, and see these new reformers, who ape him in his worst qualities, and blunder and bluster in the seat which he once filled with such glory and success."

Nobody escapes—Lyndhurst, Melbourne, Althorpe, and of course Brougham, alike come under his lash. But it is evident that one who could write in this style of two such men as the late Lord Derby and the late Lord Palmerston had proved themselves to be by the year 1834, must have been deficient in penetration, and a very poor judge of character. Nevertheless, as we have already stated, by bringing together the various notices of men and measures which are to be found in these volumes, and by reading them by the light of subsequent events, we shall find that we have excellent materials for forming a correct and well-balanced estimate of both. The facts and circumstances which

he records are of course none the less interesting for the use to which he turns them. And we might fill a whole number with them, nor fear that our readers would be satiated. We must content ourselves, however, with two. When Lord Grey resigned in May, 1832, and the King commissioned the Duke of Wellington to form a Government, it was intended to prorogue Parliament, to suspend violent discussion. Such a step was natural, legitimate, and of the greatest possible importance. The King told Lord Lyndhurst to go to Lord Grey and inform him of His Majesty's pleasure; and Lord Lyndhurst forgot it. Another passage relating to the Reform Bill we shall quote, because it throws great light on a passage in Lord Dalling's *Life of Peel*, where Lord Dalling is illustrating Peel's deficiency in promptitude:—

"After dinner on Sunday Brougham talked of the Reform Bill and its first appearance in the House of Commons. He said that, once allowed to take root there, it could not be crushed, and that their only opportunity was thrown away by the Tories. Had Peel risen at once and declared that he would not even discuss such a measure, that it was revolution, and opposed its being brought in, he would have thrown it out, and if he had then come down with a moderate measure, it would have satisfied the country for the time. This is exactly what William Banks said to me last year, and the very thing Peel had intended to do, and from which he was deterred by Granville Somerset."

Lord Dalling did not know that this was the very thing which Peel had intended to do; and his omission to do it he cites as an example of his want of readiness and decision. With a good thing of Lord Lyndhurst's we must conclude this portion of our article:—

"The Duke of Wellington (1833) has continued to attend in the House of Lords day after day, proposing alterations and amendments to all the Bills, evidently reading hard, and preparing himself for each occasion, always loaded with papers. Lyndhurst said to somebody, 'I shall attend no more, what's the use of it?' The Duke comes every day and tries to make the Bills better; if I could make them worse, I would come too."

In anecdotes of society and manners these volumes are so rich that no selection can be made. We throw out one or two just as samples of the rest:—

"During the riots in 1780 on account of Admiral Keppel, Tom Grenville burst open the door of the Admiralty, and assisted at the pillage and destruction of papers. Lord Grey a little while ago attacked him about it, and he did not deny it. Such things could not be done now. During the Windsor election they hired a mob to go down and throw Lord Mornington (Lord Wellesley) over Windsor Bridge, and Fitzpatrick said it would be so fine to see St. Patrick's blue riband floating down the stream. They first sent to Piper to know if Lord Mornington could swim. The plan was defeated by his having a still stronger mob."

In 1830, when the country was terribly disturbed, and some districts one blaze of incendiarism, "the Duke of Richmond went down to Sussex, and had a battle with a mob of 200 labourers, whom he beat with fifty of his own tenants, harangued them, and sent them away in good humour." In 1830, when Brougham made Lord Chancellor, Mr. Greville dined with him at Lord Sefton's,

who chaffed his new Lordship all dinner time, and "after dinner he walked out before him with the fire shovel for a mace, and left him no repose the whole evening." At dinner at Holland House, September 13, 1834, Lord Melbourne "swore that Henry VIII. was the greatest man who ever lived." John Allen, the well-known Radical, said if he hadn't married Anne Boleyn we should all have been Roman Catholics to this day. Allen himself, according to Mr. Greville, was a bitter unbeliever; and he would have it that Lord Melbourne was one too. He likewise said that if Mackintosh "had lived much with Christians, he would have been the same." There is one good anecdote from Rome:—

"To the Sistine Chapel for the ceremonies of Palm Sunday. We got into the body of the chapel not without difficulty, but we saw M. de la Ferromays in his box, and he let us in (Marin and me). It was only on a third attempt I could get there, for twice the Papal halberdiers thrust me back, and I find since it is lucky they did not do worse: for upon some occasion one of them knocked a cardinal's eye out, and when he found who he was, begged his pardon, and said he had taken him for a bishop" (i. 309).

With literary reflections and reminiscences these volumes are abundantly supplied. Mr. Greville was very fond of comparisons. Burke and Mackintosh, Macaulay and Brougham, and some other couples, he analyses and contrasts with great ability. The comparison between the style, conversation, and oratory of Brougham and Macaulay, at p. 338, vol. iii. is admirable, but too long to insert. *A propos* of these two men, Mr. Greville quotes a curious story told him by "Stephen" (we suppose Sir James Stephen). He said he had known Brougham above thirty years—this is in 1836—and remembered walking down with him to Clapham to dine with old Zachary Macaulay and to meet a prodigy of a boy, who, of course, was the redoubtable Tom. Brougham characteristically at once offered to take charge of his education: and to a certain extent actually did so. "But he was like the man," says Mr. Greville, "who brought up a young lion, which finished by biting his head off." According to the same authority, Brougham was intensely jealous of Macaulay, who beat him at his own weapons. Macaulay's memory, if all is true that is told of it, was indeed astonishing. "Stephen" said that he could repeat the whole of Demosthenes by heart, the whole of Milton, and a great part of the Bible. But he did not get on with law, and he hated mathematics. There is a great deal of literary conversation scattered up and down the volumes, especially such as took place at Holland House. In 1834 the opinion of Holland House was still unfavourable to Wordsworth. Lord Holland himself thought Crabbe the greatest of modern poets. Lord Melbourne thought he degraded every subject he touched. Coleridge's lectures were voted tiresome, but his poetry was allowed great merit. Few women they thought had written well: Mme. de Sévigné the best. Sappho, whose claims were supported by Bobus Smith, had written too little. Miss Austen's novels were allowed to be excellent. Not a word, however, of Miss Ferrier or

Mme. d'Arblay. Rogers's breakfasts are mentioned; and Horace Twiss's "Judy" suppers. At the former Mr. Greville meets Sydney Smith, Moore, and "John Russell," and comes away convinced that breakfast is the meal for poets. At the latter, where everybody is bound to be amusing, he finds, among others, Mrs. Arkwright (one of the Kembles), Planché, Theodore Hook, and "Billy something," who imitates Cooper and Ward. His verdict is: "amusing, but noisy and vulgar."

It is impossible in a short review to give anything like an exhaustive account of such a work as the present. We have omitted a great deal which to many readers might be more interesting than what we have introduced; and a great deal of the very highest interest to all classes of readers. We have purposely omitted all those anecdotes of the Royal family which we think it was a mistake to publish; and as the remainder are of no particular interest, we have omitted all. What we do regret that our space precluded us from quoting, are some of Mr. Greville's portraits of his contemporaries which show a rare talent for character painting, whenever he understood his subject. Though his insight was not deep, his power of expression was considerable. And where he had a strongly marked character to deal with, he produced very striking resemblances. His characters are not perhaps on the whole equal to Lord Cockburn's Brougham, but the best of them run it very close, and as specimens only of English composition possess unusual merit.

T. E. KEBBEL.

Some Account of the Glenriddell MSS. of Burns's Poems; with several Poems never before published. Edited by Henry A. Bright. Printed for Private Distribution. (Liverpool: Walmsley, 1874.)

THIS handsome little book will be extremely dear to admirers of Burns; and, as all Scots come under that designation, not to speak of numerous Englishmen as well, the "private distribution" named in the title-page will no doubt be far from satisfying the natural demand. The Scotchman who has not got the book will envy the other favoured Scotchman who has. The history of the work is as follows.

In 1853 the widow of Dr. Wallace Currie, son of Burns's biographer, presented to the Athenaeum Library in Liverpool two MS. volumes, consisting, the first, of poems by Burns selected from his unprinted collection for Captain Riddell, of Glenriddell, seventy-eight pages of these poems being in the author's autograph; and the second of letters of his own writing, selected in like manner, and almost wholly in his autograph. These treasures remained practically unknown until 1873. A preface written by Burns in April, 1791, deprecates the publication of the poems in question; but in fact almost all of them have ere now been printed, some having, however, been omitted by Dr. Currie on account of their Jacobite or anti-loyal tendency. Captain Riddell was Burns's neighbour when the latter in 1788 settled on his farm of Ellisland; and the Captain entitled himself, by steady friendship and

attentions, to the gratitude and goodwill of the poet. After Burns had removed to Dumfries, in December, 1791, he almost lost sight of Riddell, but became intimate with his younger brother, Mr. Walter Riddell, and his wife. Unfortunately, a quarrel occurred between the poet and Walter Riddell at the end of 1793; the Captain, who sided with his brother, died shortly afterwards. Burns then, with manly right feeling, disregarded the recent estrangement, and wrote the so-called "sonnet" on the Laird of Glenriddell, beginning—

"No more, ye warblers of the wood—no more!"

He wished to get back from the representations of his deceased friend the volume of MS. poems, or to have it destroyed, speaking of the contents, with greatly overcharged disparagement, as "many of them local, some of them puerile and silly, and all of them unfit for the public eye." This request, however, was not acceded to.

The as yet unpublished items are now printed in full, with no change of spelling or of punctuation; the editor regards them as probably the last novelties from Burns's pen that will ever be forthcoming. These items are as follows:—1. "Ode to the departed Regency Bill, 1789;" 2. "Birthday Ode, December 31, 1787" (a small portion only had previously been made public); 3. "From Clarinda, on Mr. B.'s saying that he had nothing else to do," with "Answer to the foregoing, extempore;" 4. "On Glenriddell's Fox breaking his Chain" (published in the *Athenaeum* journal, April, 1874, by the editor of the present volume, but not otherwise known); 5. "On Captain Lascelles," epigram. In the other poems, fifty-two in number, appear many variations from previously published versions, and other minor points of curiosity or interest to the students of Burns; these are carefully set forth in Mr. Bright's list of contents. For instance, an account of Holy Willie; two additional stanzas to the "Poet's Welcome to his love-begotten Daughter;" and the proof that the two denunciatory epigrams beginning—

"Light lay the earth on Billy's heart,"

and

"Stop thief, Dame Nature called to Death."

were not (as hitherto generally surmised) intended for the same person, but referred, the former to Captain Ruddock, and the latter to Mr. Graham "of M-skn-w" (Mossknow?).

As to the newly-published poems. The "Ode to the departed Regency Bill," a very outspoken piece of political satire, is among the finer specimens of Burns's English (as distinguished from his Scottish) compositions. The "Birthday Ode" is in honour of the younger Pretender, and shows the most positive Jacobite sympathies. The lines to Clarinda are of no great merit; the editor raises a question whether the verses "From Clarinda," to which Burns thus replies, may not also have been his own handiwork. The poem "On Glenriddell's Fox" is but a fragment: many of our readers will already have perused it, and appreciated its sprightly and unforced banter. The epigram on Captain Lascelles is far from being

one of Burns's best; its brevity, however, commends it for citation here:—

"When Lascelles thought fit from this world to depart,
Some friends warmly spoke of embalming his heart.
A bystander whispers, 'Pray don't make so much
on't:
The subject is poison—no reptile will touch it.'"

W. M. ROSSETTI.

Egypt and Iceland in 1874. By Bayard Taylor. (London: Low, Marston, Low & Searle, 1875.)

THE author of this somewhat ante-dated volume is not unknown in Europe: in America not to know him is to proclaim oneself unknown. By turns, and sometimes all at once, he has figured as printer, journalist, dramatist, poet, special correspondent. That he has been a diplomatist we are almost certain; that he has figured as a tourist in every land under the sun, let the multitude of ephemeral travels which bear his name on the title-page testify. In a word, he is "one of the most remarkable men" of his country. But whether as a writer in the *Tribune*, as translator of Göthe, as Bayard Taylor of Central Africa, Bayard Taylor of California, Bayard Taylor of Japan, or Bayard Taylor the Secretary of Legation, he has, while doing everything well, in none soared above respectable mediocrity. In this book he appears in his old character—a respectable tourist—not a traveller, and quite bears out the reputation of the man of whom Humboldt is reported to have said that "he had travelled further and seen less than any person he had ever met." In Egypt, on *Tribune* business intent, he lands in March, 1874. He finds everything in Alexandria greatly changed since he visited it twenty years ago. English is spoken everywhere—225,000 people are intent on gain, and with such good results that 25,000,000*l.* are laid out in banking alone. People who once rode on donkeys ride in carriages now. Old customs are dying out—the pipe, the meditative coffee-house, and the story-teller are disappearing and giving place to elegant hotels with every European luxury except bells. To Cairo he hies by rail. Here, too, everything is strangely altered since 1852. Railways and telegraphs intersect the Delta. Christian churches are built alongside of the mosques; a daily paper is flourishing; a carriage road is made to the Pyramids and Heliopolis; unveiled ladies drive about in spanking equipages—and the faithful are not abashed. Trotting mares and English "tigers," modern residences, and parks in imitation of the Bois de Boulogne, serve to change the aspects of the place; and were it not that still the muezzin calls the Moslem to prayer, the traveller could scarcely believe that here is the city of the Caliphs and the Mamelukes. Finally, everything is twice as dear as in 1852, and a trip up the Nile has now become one of the luxuries of travel to which only long purses can aspire. Apparently Mr. Taylor is supremely disgusted. There is not a more honest lover of the past—whether of good or bad report—than your intelligent New Englander, if he happens, like our author, to be of a sentimental

turn of mind. The old Moslems care little for these changes; but the younger or more ignorant of the population look upon the Khedive's reforms only as something which brings in "backsheesh" present and prospective. The future is a factor which has no place in their calculations, and so they stare at the statue of Ibrahim Pasha, and get their *cartes de visite* taken by the Frankish photographer, all careless whether the Koran prohibits it or not. Of course Mr. Taylor goes to the Pyramids, and looks as coldly as does the Sphinx on the crowd of tweed-clad Cockneys who are munching cold chicken on the tomb of Cheops. He interviews the Khedive—who is understood to be sore if the name of Baker is mentioned, but speaks freely of all other travellers in his dominions; visits Mariette Bey's splendid museum of Egyptian antiquities at Boolak, and there finds material for two chapters on ancient Egyptian history and literature, which, though mainly founded on the official catalogue of the collection, are the most valuable—or rather the least valuable—in the book. The conclusion Mr. Taylor arrives at from his visit, is that under the present intelligent ruler of Egypt the country is vastly improving, but that his reckless Oriental personal extravagance, and almost Hebrew-like capacity for mortgaging and foreclosing on other people's lands, is crushing a population only numbering about 7,000,000 all told. Indeed, so terribly is the load of taxation felt, that a new sect is said to have arisen the main tenet of whose faith is—death to the Frank and all his new-fangled ways.

Why Mr. Taylor should have included Iceland under the same cover with Egypt is difficult to say, except that his letters on either country, reprinted from the journal which he represents, would by themselves have formed too thin a volume for the purpose of publication. Accordingly, to Iceland we go, with him and hundreds more, to witness the celebrations attendant on the one thousandth anniversary of the settlement of the island, of which the newspapers have only recently given such an exhaustive account. He sees nothing of Iceland except the well-worn sights within a short radius of Reikjavik. He gives the old—the very old—story in which "vikings," "sea-kings," and "saga men" are freely used; and thereafter the American party follow at King Christian's heels with a keenness of scent only known to the avowed despisers of monarchy. They listen to the address in Icelandic, they dance at the ball, they eat the dinner prepared beforehand in Copenhagen, they interview the King (but, strange to say, do not report his conversation); they go to Thingvalla and the Geysers—in a word, they do everything which thousands have done both before and since, and reported in a hundred books, papers, and published letters. We have perused all that Mr. Taylor has written, but can find nothing which has not already been frequently recorded before, and in reference to which everyone in the slightest degree acquainted with Iceland must be very familiar. We accept his high opinion of Icelandic intelligence; but will caution our readers against receiving, without many grains of salt, his account of the political state of the inhabitants, as it has been

evidently inspired from a source not difficult to divine.

Finally, they land at Leith, and having, in order to fulfil the hollow technicality of the law in reference to their steamer, which was not licensed for passenger traffic, been shipped as "British seamen," they go to the Custom House for their discharge. They have the satisfaction to know that in that capacity this voracious document states their conduct and ability to have been "good." We have no doubt but that Mr. Taylor and his companions well deserved this; but it is only our function to deal with his book. To say that it is written in as fresh and pleasant a style as a stale subject will allow of, and without any of that obtrusive nationality which certain of our American cousins are apt to show when taking the European tour, is only equivalent to saying that it is written by the deft penman and accomplished citizen of the world the author is known to be. Why the letters of which it is made up should originally have been written we know; but why they should ever have been reprinted in book form we will leave Mr. Taylor's publishers and his readers to settle between themselves. Those whom the name of Iceland forces to fly to their Gazetteers, and who live in such remote districts that the newspapers of last August have not yet reached them, or who only know of Egypt as the land into which Joseph's brethren went to buy corn, may derive some information from it. But we defy anyone else to extract much mental pabulum from the 280 pages contained within its boards.

ROBERT BROWN.

DR. GRANVILLE'S AUTOBIOGRAPHY.

Autobiography of A. B. Granville, M.D., F.R.S.; being Forty-Eight Years of the Life of a Physician who practised his Profession in Italy, Greece, Turkey, Spain, Portugal, the West Indies, Russia, Germany, France, and England. Edited by his youngest daughter, Paulina B. Granville. In Two Volumes. (London: Henry S. King & Co., 1874.)

THOUGH long, this is on the whole an interesting and instructive book. After reading it, honestly, one feels as if he had been at a panorama—"across a continent in two hours;" a maze of bewildering details has passed before his eyes; yet he cannot say he has learnt nothing. Two large classes of persons might much enjoy these volumes—supposing them gifted with curiosity—those who know nothing of physic, and those to whom aristocratic circles have been a closed region. The former will find a very active and successful medical life frankly detailed, and may be supposed capable of not taking for medicinal facts all an enthusiastic practitioner's own ideas on the value of his own plans of treatment; and the latter will be regaled with an insight into high life, narrated by one keenly susceptible to its pleasures, and whose delight in it is unmarred by disappointment. One fact also is strikingly confirmed by the history of the earlier years of Dr. Granville's life, namely, how slightly the general routine of life may be affected by its being passed amid the

utmost turmoil of war. The most gigantic struggles of modern Europe were being fought out around our author's path, yet references to them occur but as to minor and subordinate events, and some of the chief actors in them flit like shadows across the scene. Here, for instance, is a vision of Napoleon on his entry into Milan on May 15, 1796:—

"An under-sized man, with a lank sallow face, rather compressed than meagre, or, as he himself used to say, 'J'étais un vrai parchemin,' with sparkling eyes, overshadowed by straight black hair, which, descending over a large forehead, came down the sides of the head and touched the shoulders. . . . Riding a white horse that seemed nearly exhausted with fatigue, he was followed by his tattered infantry battalions, the heroes of Montenotte, Millesimo, and Lodi, looking very much like the tatterdemalions Falstaff refused to lead through Coventry. Reviewing them shortly after, 'Soldats,' said Bonaparte, 'vous êtes nus, mal nourris; on nous doit beaucoup.'"

Not that Dr. Granville was an apathetic spectator of political events. On the contrary, in his youth he was a zealous Republican, even to the incurring of college troubles; though he was soon cured of that enthusiasm, and became an ardent labourer for the monarchical unity of Italy. And all through his life politics, especially patriotic work for his native land, divided his attention with professional and scientific labours.

But we must introduce our author. Dr. Auguste Bozzi Granville [the name of Granville being that of his grandmother, assumed by him on entering upon practice in England] was born in Milan, October 7, 1783; third son of the Postmaster-General of the Austro-Lombard provinces. Though he remained all his life Italian in heart, he was proud of his share of English blood; and perhaps the Saxon pertinacity may be traced, united with more Southern vivacity, in his untiring and varied activity. He was proud also of a union of his family, on the female side, with that of the ancestors of the Bonapartes.

Thus happily born, and endowed with popular talents, among which were those of poetry and music (the latter of which he considers to be often an insidious and dangerous endowment, if much indulged, alluring young men to their ruin), his education also was well cared for, and his enthusiastic recollections almost place us in the presence of a group of most illustrious men; among the rest of Volta, whose first demonstration of the Voltaic pile he was privileged to witness.

"How shall I describe," he says,

"the feeling which we experienced on the day when the immortal Volta in our presence called into existence this mighty power? He first placed (explaining as he proceeded the order and the reason of it) two round pieces of dissimilar metal in contact, and upon them a paper moistened in salt water, to the number of 100 couples, secured between slender glass rods; then he showed us on the instant, and made us feel, the electric spark."

The undergraduates, as might be supposed, fell to using up their coins and linen in repeating the experiment at every opportunity, and were proud indeed in exhibiting the new force before illustrious professors from neighbouring cities. But this fascinating stu-

dent life ended at nineteen with a medical diploma, and the young doctor set off to seek his fortune first at Genoa, leaving home secretly to avoid enrolment in the conscription. But the tyranny with which France then ruled Italy was not so to be balked, and nothing remained but to fly to Venice, and take refuge under Austrian rule. But how to escape? Here came into play, for the first important occasion, the readiness of resource which afterwards stood Granville in such good stead as a physician. A theatrical company had just lost its "secondo amoroso;" he, having been well drilled in private theatricals, is accepted instead; is smuggled across the Peninsula; at Venice flatly refuses to play; is brought before the Imperial Commissioner; in him recognises, overjoyed, his own elder brother; solatium to manager. End of first act, with just retribution to a former devotee of France and the Republic.

Now the scenes begin rapidly to shift. Having resolved to travel to the East, he first visited the Ionian Islands, and at Corfu accepted the post of physician to Mr. William Richard Hamilton, afterwards British Minister at the Court of Naples, and accompanied him to Constantinople. On the way he travelled through Albania, and ran great risk of being kidnapped by the Vezir Ali Pasha, "the most hellish of the Turkish chiefs of the day." At Janina he reports a curious phenomenon. Near the Metzikili mountains

"are several islands of considerable extent formed of the roots of reeds. Though not more than one cubit thick, they will support men and cattle. Some have large trees upon them, and when there is much wind the islands are put in motion. . . . One is so timed in its approaches to the land on the town side as to serve as a ferry for crossing the lake. . . . The proprietor of the island on which I crossed was a member of a family who had borne the name of Charon from time immemorial."

A propos of classical stories, Dr. Granville suggests a version of the golden fleece. The Zagoreans are successful breeders of silkworms, and guard their secrets with the utmost jealousy:—

"These selfish descendants of Jason seem to retain an hereditary exclusiveness. In a word, the golden fleece was silk. Having learnt whence the golden-hued lustrous Median robes had come, thither the Argonauts proceeded; and the love-smitten Medea aided them to elude the worm-preservers' wrath."

At Zagora also, seventy years ago, there flourished, and set an example to the world, a lady doctor; Dr. Don Gaetano having "instructed the sister of his deceased wife to act as a physician and apothecary, an office she had successfully filled for some years, though unable to read or write. Our author talked with her, and found her modestly capable.

In Constantinople—Mr. Hamilton having been recalled to England—Dr. Granville lived as physician in a Greek family, allied to the Hospodars of Wallachia. He found high Greek life

"surrounded by a more charming prestige than he has ever met with in Western aristocratic circles, due to a number of pleasing customs and delicate proceedings that made the absence of the more bustling ostentation and unmeaning display of modern fashionable life elsewhere not in the least to be regretted."

Also, as a physician, having long worn the Turkish costume, he gives it a decided preference to the European on every ground; alike for health, development, and appearance. In five minutes you are attired,—

"You may even dispense with an attendant to put the long wide sash or shawl round your waist, which is *de rigueur*; for if you fasten one end of it to the key of your bedroom door, and stretch the shawl to its full length by going towards the opposite wall, you may roll yourself neatly up in its folds, keeping the straight end tight in one hand while you waltz round on your return to the first end, which you then detach and tuck in at the waist. The operation used to occupy me one minute exactly."

Can we be here approaching the origin of the pious waltzing of the dervish?

At Constantinople, Dr. Granville suffered from the plague, caught, he considers, from two porters who aided him on landing; and here and elsewhere he expresses very earnestly his conviction of the absolute necessity of quarantine regulations.

Becoming, next, surgeon in the Turkish, and then in the English fleet, after a short sojourn in Spain and Portugal, he found a good English wife at Portsmouth. And the activity of his intellect showed itself in the fact, that having to spend a few months in Manchester in 1812, he amused himself by writing five critical essays on John Kemble in his chief characters. We may mention here that at a later period of his life he accuses the British Admiralty of deliberately defrauding him of his half-pay.

Settled now in England, he engaged in efforts of Italian patriotism; and, through Mr. Hamilton, was despatched to Italy on diplomatic affairs. How, while he was there, he met Sir Humphry Davy, Faraday, Cardinal Mezzofanti, and the Signora Tambroni, the lecturer on Greek; how he gave occasion to the Austrians to imprison him, through rescuing a woman from the brutality of an officer, and has the lowest opinion of the honesty of the Austrian officials; and, finally, how he predicted the escape of Napoleon from Elba, and vainly warned the British Government—we must refer to his book to show. As also how, in Paris, he aided Canova to thwart Talleyrand's machinations, and regain the works of art carried away by Napoleon; how, by hard work, he restored his shattered health; and helped to introduce to England Pistrucci, the Roman sculptor, who produced the Waterloo medal, and a cameo of whose was palmed off by Bonelli on Mr. Payne Knight at a great price as an antique; how he attended M^{de}. de Staël in her last illness, and thought her restlessness denoted that she almost believed she might be exempt from death; how he studied the art of the obstetrician in Paris and laid the basis for his great success and considerable fortune; the reforms he wrought in England, beginning with the Royal Society and extending down to the reports of dispensaries; how he almost ruined Buxton by his work on the Spas of Germany, and set her on her legs again, with Bournemouth for a southern sister, by his book on the Spas and Watering-Places of England; how he went to Russia to attend noble ladies; was fascinated; and defrauded when he presented a medal to the Emperor, and many things besides. But we must make

room for a tribute of justice to the painter John Martin, who, it seems, had designed the plan of metropolitan main drainage and embankment many years ago on a scale even more complete, but money failed the projected company; and for the story of Morrison the Hygeist's ball. The "Millionaire Anglo-Américain" filled his rooms with the *élite* of Paris:—

"At one o'clock in the morning a magnificent supper was served, following a most delightful concert, in which the best talent of the Italian and French operas achieved great success. At dawn of day the company began to disperse, and as each guest stepped into his or her carriage, he or she received a splendid enamelled card with an inscription which the increasing daylight enabled the curious to read: 'M. Morrison remercie, and begs to recommend the never-failing vegetable pills,' &c.

For proof "refer to the Préfet of Police of the time, or to any survivors among the *employés* of the British Embassy in Paris in June, 1817."

One subject of the utmost consequence receives illustration in this volume—the disastrous influence often exerted on human affairs by cerebral derangement assuming the aspect of moral obliquity or unreasonable obstinacy. A private letter from Dr. Granville to Lord Palmerston, which was sent to the *Times* shortly after the death of the late Emperor Nicholas, is reprinted here, containing evidence that the course adopted by him previous to the Crimean War was the expression of disease (apparently hereditary). But it is not only in exalted stations, and through the abuse of despotic power, that life is desolated by this cause; nor, perhaps, could the sum of human misery be diminished more effectually by any means than by a more truthful estimate and quicker apprehension of that form of disease which wears the mask of moral perversion. But this Autobiography touches, though but slightly for the most part, upon many subjects of interest, and we quit it with the feeling that we have been made the companion of a genial, affectionate, capable, and most industrious man, perhaps not of the loftiest aspirations, but of a real sincerity, who was impatient of any evils he saw his way to remedy, and willing to devote labour to objects from which he could derive no personal gain. He was a true physician; but still we would not advise his lay readers to treat their children in whooping cough with prussic acid. The discovery of new and successful modes of treatment has more difficulties than an inexperienced person perusing this volume might be apt to suppose.

JAMES HINTON.

Lucrezia Borgia, nach Urkunden und Correspondenzen ihrer eigenen Zeit. Von Ferdinand Gregorovius. Zwei Bände. (Stuttgart: Cotta, 1874.)

It is impossible not to sympathise with the feeling that makes Herr Gregorovius devote himself to a popular subject after having reached the end of his serious labours in the *Geschichte der Stadt Rom*. Ending that work as he does with the beginning of the sixteenth century, he had the characters and careers of the Borgias fresh before him. In his researches he had gathered much

material which he could not use for the purposes of his history, so he fixed upon one of those heroines of historical gossip and scandal, whose name is sure to attract the attention of the literary lounge, and has grouped round Lucrezia Borgia the result of his enquiries into the character of Alexander VI. and his sons. After having worked so long to benefit the learned few, Herr Gregorovius now comes forward to amuse the idle many: those who have no care for history shall be caught by gossip.

However, Herr Gregorovius has brought to his task, trivial as it may be, the care and patience of a skilled worker. He has never tried to be sensational, and has spent no time in idle declamation. He founds his conclusions on an accurate investigation of all the letters and documents which he can find with any bearing upon his subject, and he prints in a separate volume the more important of them. He contents himself with showing that, so far as they go, there is nothing whatever to justify the terrible character which romance, following a few mentions of contemporary writers, has given to Lucrezia. He does not, however, claim for her, as some apologists have done, the position of an injured saint: he merely aims at proving that she was an ordinary respectable woman of that age, who would not, if she had not been the Pope's daughter, have been in any way remarkable. It was the charm, rather than the force, of her nature that raised her above the ordinary level. So far from being a tragic heroine, she does not seem ever to have felt a real passion in her life. Like a dutiful daughter she obeyed her father, and believed that, though his arrangements were rather odd, he still had her interests at heart, and would make a good provision for her in the long run.

This conception of her character is certainly borne out by the letters which Herr Gregorovius prints; but perhaps he has been too ready to credit her with fixed principles, and has made too little allowance for her acute calculation of self-interest. Bred in an atmosphere of easy self-indulgence, she soon developed a graceful and languid selfishness, which accepted without much reflection any position which was tolerably comfortable. Her first husband was divorced at her father's bidding, for she knew a more prosperous husband would soon be provided for her. Her second husband was murdered by her brother to suit his own political plans, but Lucrezia soon dried her tears, for after all her own interests and her brother's were much the same. But when a third husband was brought to her, the heir of the ducal house of Ferrara, she felt that here was a position that would last for her lifetime. Herr Gregorovius thinks her marriage with Alfonso of Este was a great moral turning-point in Lucrezia's life. But he does not notice how entirely this must have been owing to the keenly-awakened sense of self-interest. When the marriage negotiations began, Lucrezia knew that her future husband disliked the alliance, and that his father was only brought to consent to it by strong political pressure from Louis XII. of France. She had never seen her unwilling suitor, and no feeling of

tenderness or affection can have influenced her. She saw that here was a great chance offered her of gaining a high and independent position, and she was determined not to miss it. She charmed the Ferrarese ambassadors by her courtesy; she wrote so prudently and respectfully to her intended father-in-law, that he began to lay aside his bad opinion of her. Whatever she had done before, henceforth she was determined to live cleanly.

At Ferrara she won golden opinions, and no voice was ever raised against her conduct there. It is from this fact, and from the tone of her letters, that Herr Gregorovius infers that she was really a quiet and respectable woman, who could not have been guilty of the monstrous charges which have been brought against her. Probably she was not guilty, but this particular argument counts for nothing. Becky Sharp was not the first person who discovered that it was easy to be virtuous on five thousand a year. Lucrezia came to Ferrara a mere adventuress. Her father had forced her upon an unwilling husband, and the position so hardly won must be secured by her own skill; at her father's death, which could not be far off, she would be helpless unless she helped herself. Moreover, Lucrezia was, as has been said, of an easy, yielding, self-indulgent nature. Such natures suffer little from remorse, for they have little feeling of responsibility, and they are easily moulded either for good or bad by their purely conventional surroundings. The position of Pope's daughter was one difficult to fill with decorum, since the restraints of conventional morality were entirely wanting to it. But it was far otherwise with the position of Duchess of Ferrara: when once her station in life was secured, Lucrezia fell naturally into the respectable performance of her duties, and carried away no strong feelings from her past.

Of this psychological possibility Herr Gregorovius has taken no account, and, therefore, his psychological argument is very far from conclusive. Lucrezia's stainless life at Ferrara does not prove she had been stainless at Rome, nor do her respectable letters show that she was incapable of iniquity. The blackest charge against her is certainly without any good authority, and perhaps, as Herr Gregorovius suggests, many slanderous tales were spread about her by her divorced husband Giovanni Sforza, who deeply resented the slight put upon him by his divorce. But about her presence at the disgusting orgies of Caesar Borgia, Burkard, the Pope's master of ceremonies, is our authority. Burkard's general trustworthiness Herr Gregorovius readily admits, but is willing to assume that, about so small a matter as Lucrezia's gleeful presence at a revolting scene of profligacy, Burkard must be mistaken; and his only ground is this:—"Who could believe that Lucrezia, who had been already legally declared the bride of Alfonso of Este, and was just on the point of setting out for Ferrara, should have been the laughing spectator of such a scene?" This is simple claptrap, which one who knows so much of the manners and feelings of the sixteenth century as does Herr Gregorovius must have written only for the very ignorant.

With the conception of Lucrezia's character which we have briefly sketched, such a feature is in entire agreement. Right and wrong were scarcely categories of her mind at all; she took things as they came, and made the best of them. She laughed with careless good-nature at the indecencies which amused her father and brother, and then she passed on to lead a strictly respectable life at Ferrara, where her fortunes depended on her good behaviour.

Herr Gregorovius makes very true remarks about many of the characteristics of the Renaissance epoch, when he stops for the purpose of generalising; but he does not keep these characteristics clearly enough before him when he is moving among the men to whose actions they apply. He can stop and remark on the difference between the moral views of our days and those, but in dealing with the men of those times he credits them with the consciences and moral perceptions of the nineteenth century. Profligacy at the era of the Renaissance left no stain upon the conscience; treachery and guile did not diminish fearlessness and self-respect: it was not hypocrisy, but a sense of aesthetic propriety, that clothed the outward forms of life with strict decorum.

The general result of Herr Gregorovius' enquiries into the life of Lucrezia Borgia is to prove that very little is known about her, and that the little that is known does not show her to have been a person of much importance. We learn much more from this book about Alexander VI., who is entirely freed from the gloomy atmosphere of unnatural wickedness to which historians have generally consigned him. We see him, on the contrary, as a man of great personal beauty and charm of manner. His beauty had a strange fascination over women even in his old age. His presence was commanding, and his public appearances as Pope were marked by the strictest decorum, and always produced a great impression. His character was joyous and genial, and the tragedies which have made his Papacy so memorable to later ages certainly did not affect his happiness or comfort at the time. It is impossible to conceive a character so full of force, so self-reliant, so strong in every element that makes the natural man, existing at all amid the complex organisation of modern life.

Herr Gregorovius' book brings together much new and useful matter, and in many points gives a lively picture of the times. But he has tried to be too popular, and perhaps his desire for that end has robbed his hand of some of its cunning, and made his view of his heroine a somewhat crude one. It is, no doubt, good to be popular, but it is well to avoid puerility, which Herr Gregorovius has scarcely done when he stops to point out that, if the occupation of Rome by the Italian troops in 1871 had taken place in the Middle Ages, the king would have made a triumphal entry on horseback, and would not have driven from the railway station. It is also hardly necessary to tell us that in the Renaissance epoch they could not make such an illuminated garden fête as the Emperor of Austria made for the Shah of Persia at Schönbrunn.

M. CREIGHTON.

NEW NOVELS.

Harry Heathcote of Gangoil. By Anthony Trollope. (London: Sampson Low & Co., 1874.)

Looking for the Dawn. By James Burnley. (London: Simpkin, Marshall & Co., 1874.)

In Honour Bound. By Charles Gibbon. (London: R. Bentley & Son, 1874.)

Olympia. By R. E. Francillon. (London: Grant & Co., 1874.)

Harry Heathcote of Gangoil is a very pleasant, if not a very elaborate or important, result of Mr. Trollope's trip to the other side of the world. Harry Heathcote himself, the Antipodean counterpart of the ideal English squire, is sufficiently, if slightly, sketched; but the other characters are hardly even outlined. The interior of the Brownie family, however, is good, and the bush-fight capital. Mr. Trollope is artist enough to be aware, as he has before now shown, that a "scrimmage" is by no means the smooth, round, and Homeric thing which the ordinary novelist delights to depict. But there is one thing in the book which strikes us with some consternation. Do Australian young ladies *always* expect one to propose to them at the second time of meeting? We hope that, if it be so, the custom will be strictly confined to the bush. If people are to be allowed habitually to engage themselves with the undisciplined gluttony of Ferdinand and Miranda, what is to become of an art already maligned, misunderstood, and disgraced by bunglers—the great, noble, and intricate art of flirtation?

Looking for the Dawn is a very virtuous book, but its virtue unfortunately is rather antiquated in character. Mr. Burnley appears to have several fixed ideas, of which the following are samples. A Tory squire is a person who swears at his servants and occasionally knocks them down (we should like to see the modern Jeames submitting to this treatment), who behaves like a bear to his wife and daughter, and who, in short, is a survival of the Western class. A young man educated at Oxford in the society of the "best blood of the country," is, mainly in consequence thereof, a low debauchee, dividing his time between clumsy attempts at seduction, and still more clumsy attempts at cheating insurance offices. Another young man who, being heir to an ancient estate and name and in actual possession of a competent fortune, chooses to improve the latter by mill-owning, is *ipso facto* an angel. All "hands" are angels. Most policemen and soldiers are cowards. Captains in the British army, on an occasion when outward decency is usually observed (the reading of the will at a funeral), alternately ejaculate "dem" and "blahst." It is a pity that Mr. Burnley did not carry out his original intention, which was, he tells us, to embody the above convictions in a drama instead of in a novel. Two advantages would have resulted from his so doing. In the first place, the play would have been very popular at certain theatres, by reason of its fine full-bodied villains, its virtue triumphant, and, above all, its flattering morals, that the poor "in a loomp" are much better than their

betters, and that in miscegenation between the poor and the rich lies the only hope for the latter. In the second place, we should not have had to read it.

Mr. Gibbon has chosen for *In Honour Bound* a theme which admits of a good deal of pathetic treatment, and he has not been wanting in his development of its capabilities. Walter Burnett, of Dalmahoy, eldest son of a Scotch laird with a small estate and a large family, falls in love, or grows in love, with a certain Christina Thorston, daughter of a fisherman. But there is a sort of understanding in the family that he is to marry his cousin, Grace Wishart. In this difficulty Walter, who is a well-natured and honourable, but somewhat "chuckle-headed" young man, takes the rather incredible step of going to his cousin, stating his difficulty, and kindly offering to marry her if she likes. Grace, who is a little too angelic, requests him to marry his beloved, and promises perpetual friendship, aid, and countenance. So he marries Christina, or Teenie, as she is called, despite a little opposition from his father, who had at first favoured the match, imagining the girl to be heir to a fortune. Teenie's married life is made unhappy by an idea, partly founded on some words of the Laird's, that Walter had not been quite sincere in marrying her, or at any rate regretted that step, and by a not unnatural jealousy of Grace, though this jealousy, very unaccountably, does not produce any animosity in her mind towards that young lady. Various complications take place, and Teenie dies, principally in consequence of a wild escapade of hers, in which she runs away from her husband under the influence of the above idea. She being disposed of, everything ends happily. This is a plot not in all respects admirable, but the working out of it has produced a decidedly good novel, as novels go. The improbabilities lie chiefly in the conduct of the two heroines, Teenie and Grace. It is almost impossible that an uncultured nature like Teenie's (who is also represented as peculiarly hot-tempered), should take the disease of jealousy in a form so singularly mild in its display towards its object. And Grace in her patience rather surpasses Griselda, and the more wonderful woman in the *Heptameron* *qui réclamait son mari* by so strange a piece of complaisance. These two good ladies might explain their conduct as simply making the best of a bad job; Grace has no such excuse, but must have acted from a purely angelic nature. Mr. Gibbon must either have had very little experience of the feminine sex, or his experience must have been singularly favourable. He is much less complimentary to his male characters. Walter is, as has been said, a well-intentioned but foolish person; his father, though more tolerable, is a little too shameless to be natural. But the book is, on the whole, a good book. There is a great deal of real pathos in the description of Teenie's vague sorrows, and real pathos is not too common.

Readers of Mr. Francillon's novels should know by this time pretty well what they have to expect from him. His style and *faire* remind one, though with no servile or unpleasant similarity, of the late Lord Lytton's better manner. There is the same

affection for improbable incident and eccentric character, the same tendency to sharp and sudden contrast, and occasionally the same proclivity to rather cheap philosophising. But the author of *Pelham* was frequently absurd and not seldom dull, and Mr. Francillon, to do him justice, is not often either one or the other. When he writes carefully, the result is so good that one feels that the writer should make a permanent mark in fictitious literature; when he writes carelessly, one can only be sorry for it. The present book, taken as a whole, is not so good as *Pelham* and *Emerald*, but the heroine is a better study than Mr. Francillon has yet made. She is, in fact, so charming that one vigorously grudges her to the elderly but virtuous convict Forsyth, the most Lyttonish figure in the book. Virtue, unmerited evils, and age do not suffice, somehow or other, to make a man interesting, even though he superadd to these attractions the bluest of blood and the most consummate skill in art. And we object strongly to the not uncommon device of making a man marry his lost love's daughter. It is, as the Mosaic Law has it, "confusion," and ought to be included in the table of prohibited degrees. The fact that the other male characters are all pitiful scamps or obnoxious scoundrels, does not much matter. It is almost an accepted axiom with the modern British novelist that all male beings are one or the other, so that it is hardly worth disputing the point. It is much better to imitate the wise acquiescence of the late Bishop of Southwark, who being informed by a London street boy that he was "no gentleman," replied, "Perhaps not, my dear, perhaps not." Mr. Francillon has chosen to stand or fall according to the merits of one character, Olympia, and we think he stands. But we wonder whether, in these hasty days, it would be too much to ask of a novelist that he should not thus write books, but that he should bestow on at least one novel the same equal and pervading care which other artists are expected to give. We should not think much of a painter who should send in for exhibition a large and complicated picture, with one figure or one patch of foliage carefully drawn, and the rest a mass of blotch and blur. We should hardly admire a poem which had one good stanza and twenty bad ones. And yet in each of these cases the artistic defect would be less, because the parts would be more easily separable than is the case in a novel. There are not many novel writers who could do better than Mr. Francillon; it is rather a pity that he should choose to swell the mass of hastily written trash which to-day is, and to-morrow finds receptacles not quite so honourable as the oven.

GEORGE SAINTSBURY.

CURRENT LITERATURE.

Tiny Travels. By J. Ashby-Sterry, Author of "The Shuttlecock Papers," &c. (Tinsley Brothers.) The map of the world is for the most part completed. It is true that as we approach the poles the outlines become vague and finally cease, and the map of Central Africa is receiving almost daily additions; but it is plain that at some future time, perhaps not very distant, the limit to discovery will be reached, the

Geographical Society will dissolve itself, or continue to exist only as an office for registering the alterations in political boundaries, and those who desire to write a book of travels must follow Mr. Ashby-Sterry's example, and *travel at home*. The advantages of confining oneself to this limited range are evident: the traveller's is still a terribly serious occupation, and the man who sets himself to the task of exploring unknown regions, or extending our knowledge of countries little known, must be thoroughly in earnest, and must expect to encounter dangers and privations; whereas the traveller of Mr. Sterry's type may extend his travels to any length without being, or even wishing to be, in earnest. When it is said that the author travels at home, it is not to be understood that he has never been abroad. He has spent seven hours in Amsterdam, and writes very fluently about the place. He has also been at Antwerp, Venice, at the Italian lakes, and perhaps elsewhere. But whether at home or abroad, he never ranges far. He may diverge for a time to offer us a description of beautiful scenery, or of some amusing incident; but after a mere swallow-flight he invariably returns to the themes he most loves to dwell upon—himself and his idiosyncrasies, his genial laziness, his thirst, his intense susceptibility of heat. It is interesting to know that his tongue has all the delicate sensitiveness of a thermometer, and, as such, is to him an object of careful attention. Thus at one time "it feels like a kippered reindeer's tongue;" again, "it feels as if it had been sand-papered;" and once more as "dry and rough even as that of a parrot."

Apart from this too frequent reference to self there is nothing in the nature of the subjects of which he treats that is beneath the dignity of literature. Nothing is too small or too mean for intelligent treatment. The works of Dickens and Charles Lamb, of both of whom he seems at times to have caught the manner (of the former especially in the essay entitled "Sideboard Square"), and the *Tiny Travels* of Xavier de Maistre, furnish abundant illustration of this. But to treat of the infinitely little, a mind at least moderately large is required. The smaller the object the more powerful should be the lens. Dickens employs the minute description of things in themselves uninteresting, artistically as a framework for his characters; where these subjects are treated for themselves alone, the composition must derive its chief charm from the individuality of the writer. Mr. Sterry is too apt to give a bare and almost exhaustive enumeration of details, and then to content himself with striking an attitude of mild wonder, and with asking a variety of questions to which neither he nor they require any answer. If all philosophy begins in wonder, Mr. Sterry has assuredly mastered the first step: the phrase "I wonder" is with him a rigid formula for the transition from the things he sees to the things he does not see. His misfortune is to write too easily: did he find the process of composition a labour in any sense of the word, we may argue from his character, as portrayed by himself, that he would write less. If he wrote less, he would write better; and, by going one step farther in the same direction he would put himself beyond criticism. In which case we might not be tempted to urge him to carry out his own half-threat, "I would as soon pare apples and think of nothing as weave essays and drive quills for the British public."

Crusts: a Settler's Fare due South. By Laurence J. Kennaway. (Low and Co.) The author tells a good story, how a loaf of his baking proved too heavy for human food, and was finally built in to the wall of a house. The first impression created by his book was that the amateur baker's hand had not become lighter with time, and that, professing in his title (however modestly) to satisfy the public craving for bread, he had nothing better to offer than a stone.

The experiences of a settler in a new country,

however, are always worthy of attention so far as he endeavours to give a truthful account of the difficulties he has encountered, and of the way in which he has met them; and the present volume, in spite of faults in the execution, does give us a picture which is always pleasant to dwell upon, of an Englishman, with the obstinate pluck of an Englishman, persevering against difficulties, undaunted by apparent failures, and at length establishing a home in a desolate and uninviting country.

Mr. Kennaway was one of the earliest settlers in the province of Canterbury, in the Middle Island of New Zealand, about the year 1851. The tract which he had purchased was absolutely uncultivated, and almost destitute of animal life. We hear only of wild pigs, the degenerate and carnivorous descendants of a small stock left by Captain Cook, and of more than half-wild Australian cattle which roamed over the country near the coast, seriously interfering with the earliest efforts at agriculture. The settlers found a rich soil, but the great plain which extends half across the island between the South Pacific and the outskirts of the great range of the Southern Alps was totally devoid of timber. Twenty years of cultivation have worked great changes in this, as in other respects: we are told that the spot where the author's first camp was pitched is now occupied by a house, surrounded by belts of trees, among which is a blue gum seventy feet high.

The author is by no means wanting in descriptive power, examples of which are found in his accounts, perhaps too often occurring, of the discomforts of camping out in the severe winter nights, and in his vivid picture of the difficult operation of forcing a mob of unruly sheep across one of the rapid Australian rivers. But the narrative is carelessly put together, and its want of connexion is not altogether compensated by the accompanying chart of the district, which, for the reader's guidance, has been filled in with the titles of the chapters. These titles generally contain a jocular but occult reference to the events recorded in the chapters, and, distasteful in their proper place, become more than wearisome when repeated on the chart. The passages quoted *verbatim* from the author's journal have, as a rule, a considerable advantage in point of style over those parts upon which a greater amount of labour appears to have been expended. Here the effort to please a larger audience leads to an unnatural and unchastened playfulness, which displays itself among other ways in the use of such words as "smilable," "weepable." Of the illustrations nothing more need be said than that they would have been better omitted. The same applies to the two poetical compositions which occupy some four and twenty pages, and which are really too puerile for print, however gratifying they may have been to the friends who received them in England, as proving that some culture still survived in the settler. Upon the whole, since the author of *Crusts* appears to have placed himself by honourable exertions out of the reach of hardships, we may fairly congratulate him that he is not writing for his bread.

Past Days in India, or Sporting Reminiscences of the Valley of the Soane and the Basin of Singroulee. By a late Customs Officer, North West Provinces, India. (Chapman & Hall.) A very pleasant succession of sporting scenes, portrayed with great spirit, and illustrating an eventful *shikaring* expedition in the North of India. The author, "knowing the country and its ways, having been unanimously elected president of the mess as well as caterer, has the charge and management of things in general;" and, in rendering account of his trust to the reading public, shows clearly that a better or more experienced commanding officer could hardly have been selected. He can, moreover, chronicle as well as organise, as the present smartly-written volume will testify. There is no undue prefacing or introduction to the gist of his pages. Business

is entered upon at the outset, and kept up with unflinching vivacity until about a dozen chapters before the end (there are fifty-three), when some snatches of unlooked-for versification give evidence of exhaustion. The daily incidents of the tour, however monotonous in character, will have a charm for young sportsmen, and many of the episodic tales are exceptional enough to gratify the most ardent lovers of the marvellous. Two or three fables, borrowed from Indian oral or written tradition, have a smack of the well-known Akhwānu'-s-safa and Anwari-Sohaili. A map of the localities visited by the *shikāris*, and surrounding country, added to a few illustrations, would have contributed to the completeness of the book.

Men whom India has Known: Biographies of Eminent Indian Characters. By J. J. Higginbotham, F.R.A.S. Second Edition. (Madras: Higginbotham & Co.) This is a second edition "with emendations and considerable alterations;" and the book may therefore be considered, in its way, successful. A want of amplification in some cases, of condensation in others, and of general revision, is, however, apparent in the biographical sketches; and the selection of individuals is not always judicious. Perhaps the publication of the volume at Madras is the cause that so many names known chiefly to Southern India find place in its pages. There would be no need to cavil at this fact, but that their admission causes wonder at the absence of other names more widely famed in the Peninsula. While we are introduced to field officers, captains, and army surgeons, gallant and highly-respected men, but rather of local than historical repute, we miss Lord Keane, Thomason, Broadfoot, Lord Elphinstone, and many others who have played a conspicuous part in Indian annals. In like manner, Hindú Rajahs and Muslim Nawābs, with native chiefs of various grades and castes, appear on the scene; but we see nowhere Shir Muhammad, the "Lion" of Sir William Napier's history; Rústam Khan, the host of Alexander Burnes; Nasir Khan of Haidarabad, or, indeed, any of the ill-starred Amirs of Sind. Moreover, if living celebrities are mentioned, names such as Rawlinson, Clerk, and Kaye should not be omitted from the record; and we do not exactly see how Mrs. Hassan Ali (p. 166) belongs to a group of "men whom India has known." Among the more interesting biographies are those of Governor Macrae and Henry Martyn; but both might be greatly improved. The spelling is so far consistent as to be almost invariably opposed to the lately adopted system of transliteration; but it seems to us inconsistent in its assumed conventionality. "Zeinmaun Shah" (p. 478) shows a philological independence and wholesale indifference to precedent apart from any system whatever; and "Surajah Dowlah," "Abunzafier," and other occurring orthographical eccentricities, are in much the same boat.

EDITOR.

NOTES AND NEWS.

WE understand that the author of *Supernatural Religion* will contribute to the forthcoming number of the *Fortnightly Review* a reply to Professor Lightfoot's recent strictures in the *Contemporary Review* of the present month.

WE are informed that the income from the Anglo-Saxon Professorship Fund at Cambridge, given by Dr. Bosworth, amounts now to 460*l.* a year. As the required income for the Professorship is 500*l.*, we may look forward to Cambridge having in about three years, for the first time in its history, a permanent Professorship of Anglo-Saxon; and we trust that the first holder of it will be that resident member of the University whose admirable editions of *The Vision of Piers Plowman* and the Anglo-Saxon Gospels of Mark and Luke prove him to be the fittest Cambridge man for the post.

MAJOR POWELL, who commanded the Government expedition into Colorado, is writing a series of papers on his adventures and discoveries for *Scribner's Monthly*.

Two handbooks for students, one on the *Science of Language*, the other on the *Science of Mythology*—are preparing for press, both founded on Professor Max Müller's *Lectures on the Science of Language*. The Handbook of the Science of Language will comprise the subjects treated in the first series, and in the first four lectures of the second series, with maps and tables; the Handbook of Comparative Mythology will give the results of the concluding lectures of the second series, in a condensed form, and with many additions.

A HISTORY of the Famine in Asia Minor will appear shortly, compiled from the pages of the *Levant Herald*, with a preface by the editor.

SOME of our readers may like to know that the Rev. A. B. Grosart, who has issued so many interesting portraits of sixteenth and seventeenth century worthies, is about to issue prints of Wordsworth and his sister.

DR. THIBAUT, whose paper on the origin of geometrical conceptions in Vedic literature excited a very general interest at the International Congress of Orientalists in September, has been selected by Lord Salisbury, the Secretary of State for India, for a Professorship of Sanskrit in the Government College, Benares. Dr. Thibaut came to England some years ago, to assist Professor Max Müller in carrying through the press his small edition of the text of the *Hymns of the Rig Veda*, 2 vols. 8vo (Triebner and Co.), reprinted from the large edition, containing text and commentary, the last volume of which has just appeared. Dr. Thibaut is the grandson of the celebrated jurist of Heidelberg, well known also to musicians by his work *Ueber Reinheit der Tonkunst*, which has passed through many editions.

MRS. HUMPHREY WARD, one of the granddaughters of Dr. Arnold, is writing a short primer of English literature for children. It begins with "Beowulf," which is as good as any giant story; says something of Chaucer's *Canterbury Tales*, as well as of later work; and is meant to interest young folk in the worthies of our literature.

THE New Shakspeare Society now numbers over 450 members. Its promised issue of publications is delayed for a week by the paper-maker's slowness.

THE Philological Society has just issued the fourth and concluding part of its *Transactions*, for 1873-4, including Mr. Henry Sweet's "Concise History of English Sounds" (with long lists of all the words containing the different vowel-sounds, arranged under each sound, in the three periods of English—Old, Middle, and Modern), and Professor J. B. Mayor's paper on some weak points in the metrical theories and examples of Dr. Guest and Dr. E. A. Abbott.

WE hear that Messrs. G. Bell and Sons are about to undertake a new translation of the greatly enlarged Shakspeare Commentaries of Professor Ulrich.

PROFESSOR WAGNER of Hamburg finds evident similarities between some passages in that unique copy of *Alcilia*, 1597, which we mentioned that he had discovered in the Hamburg Library, and Shakspeare's *Merchant of Venice*. He has therefore copied the poem out, and is preparing it for printing in the next volume of the *Annals of the German Shakspeare Society*. Dr. Wagner finds also that the author's initials in the first edition are I. G., and not I. C. as in the second of 1613 and later editions, so that a fresh writer has to be sought—possibly John Gouborne—instead of John Chalkhill, to whom Mr. Corser, Mr. Collier, and the British Museum Catalogue have attributed *Alcilia*. At the end of the British Museum volume that contains the 1619 edition, are some

witty manuscript poems. These will be printed for the Ballad Society at once.

WE learn from the *Nation* that the old story, according to which the regicide Goffe suddenly appeared at a critical moment among the people of Hadley, Massachusetts, and led them forth to successful battle against the Indians, and then as suddenly vanished, must be unhesitatingly relegated to the region of myth. There is no contemporary evidence whatever of Goffe's presence on the occasion; and it appears that the town was only alarmed, and not actually molested, by Indians.

AN English newspaper, called the *International Gazette*, is one of the latest literary speculations in Berlin, and the large increase of English and American travellers there of late years would seem to justify the attempt to establish it. Much useful information—such as lists of unclaimed letters left at the various Consulates, fresh arrivals, &c.—is added to a careful summary of home and German news.

THE Rev. C. Henry Daniel, Fellow and Tutor of Worcester College, Oxford, has printed twenty-five copies of *Notes from a Catalogue of Pamphlets* in his College Library. The little tract includes Brinklow's "Complaint of Roderyck Mors," 1542, now in the press for the Early English Text Society; "A Canterbury Tale, translated out of Chaucer's Old English into our now usuall Language. Whereunto is added the Scots Pedler. Newly enlarged by A.B.," 1641; "The Dolefull Lamentation of Cheapside Crosse: or Old England sick of the Staggers," 1641, with the Answer to it: "The Great Assises holden in Parnassus by Apollo and his Assessors," among whom are "The Lord Verulam" and Sir Philip Sidney; while among "the Jurours" the last two are "William Shakespeare, Philip Massinger;" "Ben Johnson, Keeper of the Trophonian Denne." Among the few early tracts are some on the Roman Catholic side. Most of the pamphlets catalogued belong to the Civil War time. Mr. Daniel says:—

"The echoes of the 'Hurle Burtle' still roll among us, the same follies still fire like passions, and the sectaries, maimed, in patched armour, offer battle with the same war-cries, inspired by the same crazes as their ancestors. An Episcopate still haunts the *Jus Divinum*; Surplice and Cope, and Cross and Image, still provoke the frenzy of the Puritan; while the clouds that encompass Altar and Font become more dense as fresh combatants shoot off the old artillery."

LAST Easter vacation, the librarian of the William Salt Library, Stafford, discovered in that collection an uncatalogued portfolio containing a number of drawings signed W. Hollar, many others signed J. E. (for Captain J. Eyre), and a mass of manuscript notes also by Captain J. Eyre, all dated either 1643 or 1644, and relating to the antiquities of Staffordshire and a portion of Warwickshire, and the changes wrought in churches and castles in those parts by the Civil War up to the middle of 1644. The first person to see them on the re-opening of the library was Mr. Robert Flamank, jun., who, struck with their artistic and antiquarian value, at once announced his intention of editing the MSS., copying the drawings in facsimile, and publishing the whole. He had copied several of the specially interesting drawings when, in one professing to represent Lichfield Cathedral as it appeared in 1643, he found some things hard to be understood, and, closer study making matters worse instead of better, Mr. Flamank confided to the librarian his doubts of the genuineness of this particular drawing. During August and September the library was closed, but, thinking the subject over and studying the facsimile, Mr. Flamank was able before August had passed to demonstrate that the original drawing had been made later than 1796. He continued to work at the portfolio—not now with a view to the publication of its entire contents, but merely of so much as might be required to prove the

Eyre drawings and MSS. forgeries, for the condemned drawing was too evidently by the same hand as the others. On the 3rd instant he found it expedient to inform the librarian of the results at which he had so far arrived. Mr. Flamank is completing his investigation, and will shortly publish a full account of his discovery, giving facsimiles of some of the drawings and of portions of the manuscript.

MR. SYMONDS writes to call attention to one or two points in our note, which should have been more carefully worded, on his article in the December *Fortnightly*. As he points out, Ford was a great artist in blank verse who can be proved to have read Italian, or at least to have used Italian phrases, but there is little or nothing to show that he was familiar with Italian poetry: even if he was so, he cannot have appreciated its metrical structure, for, as Gifford observes (p. 115 vol. i., Dyce's edition), he repeatedly uses Giovanni as a quadrisyllable. His metre, as a very able writer pointed out in the *Cornhill* some years ago, is almost identical with the metre of Shakspeare, and, like it, is based upon the metre of Marlowe, which is really iambic in structure. It is more than doubtful whether the metre of the great Italian poets is really iambic in structure, and hardly possible it can be iambic in origin; and the metre of Spenser and of Milton, the only two great poets of the period who can be proved to have been familiar with Italian poetry, though unlike in almost everything else, is alike in the presence of numerous lines which make the application of iambic scansion an impertinence or a violence. This points to the inference that both took as their base of operation not the iambic quinarium of Marlowe, but the free Italian hendecasyllable without the final syllable, which is superfluous in English, though in use of it they differ almost as much as Catullus and Vergil in their use of the hexameter. Milton subordinates his metre to periodic harmony in a way in which Spenser and the later Italians do not, but there is reason to think that they all wrote the same metre, which was independent of the metre of the dramatists.

MESSRS. MACMILLAN inform us that the note in our last number with reference to an enlarged edition of Mr. Green's *History of the English People* was somewhat premature. It should be added that it is a small history of Rome, not of Latin literature, which Mr. Creighton has in preparation.

THE untimely death of Professor Tischendorf is a severe blow to the study of early Christian literature. To the public in general he was only an editor of the Greek Testament, but scholars admired in him the most industrious collator of manuscripts in modern times, and one of the most productive editors. He was born January 18, 1815. His first critical edition of the Greek Testament appeared at Leipzig in 1841; his second, which gave the first complete exposition of his critical principles, in 1849; his eighth was only completed in 1872. In 1842 he brought out the celebrated Codex Ephraemi, a palimpsest MS. in the Imperial Library at Paris, containing portions of the Old Testament in the Septuagint and great part of the New; in 1846 the Codex Friderico-Augustanus, of which he was himself the discoverer, the same codex of which another part is familiar to every one under the name of Sinaiticus. The latter manuscript was not brought out till 1862; its value, especially in the New Testament, is sufficiently known to the readers of the *ACADEMY*. Tischendorf's own recension of the Septuagint first appeared in 1850. His labours on the text of the Vulgate were of less importance, and much still remains to be done. Yet it was he who in 1850 edited the New Testament portion of the Codex Amiatinus, perhaps the best, and certainly one of the oldest, of this version. We must also not forget his editions of the Apocryphal Gospels and Acts, and his treatise on the origin of

the former (1850-54). And these are only a few of his titles to the everlasting gratitude of theological and historical students. The romantic story of his last and most important journey to the East has been too often told by himself for us to repeat it here; indeed, he was not the man to put his candle under a bushel.

PROFESSOR SVEND GRUNDTVIG and Dr. Brandt are issuing a request, which is being published all over Scandinavia, that any persons possessing letters, poems, speeches, inscriptions, or any other materials for a life of N. F. S. Grundtvig, will graciously furnish them with the same. The public life of the veteran Grundtvig lasted over seventy years, and during that time he was equally prominent in all political, religious and literary movements in Denmark. Hence a good biography of him would be a history of culture in Denmark from 1800 to 1872. One has to go back to the lives of Titian and Michael Angelo to find a parallel for this poet's ceaseless energy from boyhood to extreme old age.

LAST week, Messrs. Sotheby, Wilkinson and Hodge completed, at their rooms, the sale of the library of the late antiquary, Mr. John Gough Nichols, which occupied eight days. The collection consisted mostly of works on topography, heraldry, family histories and autograph letters, making above 2,800 lots:—Lot (252) *Progress through Wales*, by the first Duke of Beaufort, 1684, sold for 15*l.* 2*s.* (325) A collection of original assignments and agreements between celebrated authors and their publishers, from 1703 to 1822, receipts, &c.: An assignment by Addison of *Cato* for 107*l.* 10*s.*; Colley Cibber, for 100 guineas, of *The Provoked Husband*, Rowe, of *Jane Shore*, with the signature of Pope, his attesting witness, and that of Savage as attesting witness for J. Smythe: Pope's receipt for his *Homer*, Gay's for his *Fables*, Lillo's for *George Barnwell*, and numerous others, all arranged alphabetically in three volumes quarto, by Mr. Upcott, and illustrated with portraits, 52 guineas. (439) J. G. Nichols, *Collectanea Typographica et Genealogica*, 5*l.* (637) Dallaway's *History of Sussex*, 57*l.* 10*s.* (712) J. Carter, a collection of Sketches of the Antiquities of this Kingdom, with several hundred original drawings, in thirty-seven volumes folio, 111*l.* (996) Gurney, D., *History of the House of Gournay*, 13*l.* 10*s.* (1131) Sir R. C. Hoare, *History of Wiltshire*, 12*l.* 10*s.* (1412) J. B. Nichols, *Obituary of Literary and Eminent Persons*, autograph MS., 25 guineas. (1434) Mr. Noble, *Biographical Anecdotes*, autograph MS., 31*l.* (1505) Ogilvie, *Anecdotes of all the Anglo-Norman Families settled in England since the Conquest*, MS., 15*l.* (1902) Publications of the Surtees Society, 27*l.* 10*s.* Willement's *Arms, Banners and Standards of the Royal Family and Nobility, temp. Henry VIII.* MS. with drawings, 13*l.* (2939) Seven brass and iron seals, 15 guineas. (2641) Seal found near Durham, 12*l.* (2642) Ancient metal shield of arms, 7 guineas. The sale realised 2,195*l.* 10*s.* 6*d.*

IN the Lansdowne MS. 121 is "A coppie of notes deliuered to her Maiestie [Q. Elizabeth] by Raphe Robbards," which contains seeming anticipations of the steam-boat, steam engine, and rifled guns:—

"A vessel, in manner of a Gally or Galliotte, to passe vpon the seas and Ryvers without oars or sayle.

The rarest Engine against wynde and tyde, swifter than euer was inuented, then any that euer hath bynne used for sea seruice. scene, of wonderfull effect, both for Intelligence and many other admirable exploitcs almoste beyonde the expectation of man (leaf 106)."

"A fry Chariott without horses to runne vpon the battaile, and disorder it, that no man shalbe able

A fry Chariott to abide or come nighe the same, be forct by Engine and wilbe directed even as manni of greate seruice. will, to tourne, to staye, or come directly backe, vpon any presente danger, or elles to followe and chase the enemye in their flighte (leaf 105)."

"A muskett or Calyver with dyvers strange an l

forcible shotte which no Armor will holde out, at three quarters of a mile or more. A rare Invention. And will also become a most forcible weapon in the hande, as good as a pollax, and with a trice become a perfit shotte agayne (leaf 105, back)."

These (with many others) Robbards groups under the head of "Fireworks." He complains to the Queen that "some workmen haue taken my money, and haue spoiled my modelles and devises," and hopes it will please God to put into her heart "to erecte some Academy or place of studdy and practice for Ingenious, Politique and learned men and apte Artificers, as in a corporation or bodie politique, maintayned partly by your Majestie, and partly by your nobilitie, your clergie, and your comons, for theis moste noble effectes."

A NOTEWORTHY contribution to the early history of Lincoln's Inn Fields is to be found among the State Papers, in the shape of a petition addressed to Charles II. early in the year 1664. It was drawn up by about twenty-five inhabitants and set forth that in the foregoing reign, under date 15 Dec. 1639, licence had been granted to one William Newton, Esq., to build fourteen new dwelling-houses and no more, in the said fields, for their ornament and the security of passengers; but that Thomas Newton, son of William, had lately erected several wooden houses or sheds and dug gravel pits in the middle of the fields, and had employed the said structures for "Puppet-plays, dancing on y^e ropes, Mountebanks, & other like uses," whereby multitudes of loose and disorderly people were daily brought together. These houses are also described as being on dark evenings lurking places and receptacles for thieves. His Majesty was therefore besought to direct the commissioners for highways to take down the sheds, &c. An interesting collection of signatures may be seen attached to this document. They all denote persons "of quality," and among them may be named those of Lords Middlesex, Cardigan, Bellasis and Henry Howard; Sir William Cowper, father of the Lord Chancellor, and George Cowper; and one which we take to be that of the learned and benevolent Lady Mary Armine. About the same time, the governors of St. Bartholomew's Hospital petition that a stop may be put to the proceedings of the Society of Lincoln's Inn, the latter being about to build a lane (Carey Street?) from Chancery Lane to Lincoln's Inn Fields, which will much prejudice some houses which they hold south of Lincoln's Inn Gardens.

Some of the inhabitants of Pall Mall at that time were also of good repute. The names of them are to be gathered from a memorial they addressed to Charles, representing that they had given great prices or rents for their houses, in the expectation of having the convenience of the highway between their houses and His Majesty's park wall, which expectation seemed likely to be balked. Among those who pray for a redress of this grievance are Lord Saye and Sele, Sir John Bennett, Sir Edward Brett, Sir George Penruddock, Sir Gilbert Gerard, Lady Ranelagh, and "Mr Serg^t Barcroft."

THE title given by Mr. Gardiner to his forthcoming work, namely, *A History of England under the Duke of Buckingham and Charles I.*, seems in strict accordance with the course of events. Buckingham was the actual ruler of England before the son of James I. was king, either in name or power. Many writers claim for the duke a complete control over affairs at a very early period of his career, and in matters of personal favour his influence was undoubtedly overpowering; but up to the end of 1623 James decided his own political course. From that date to his death Buckingham was supreme. We believe that the above-named history will differ very markedly from the works of recent authorities in the greater prominence given to the foreign relations of the kingdom, a vast amount of unused

material, in the shape of copies of French and Dutch despatches amongst the British Museum MSS. and foreign State papers in the Record Office, having been investigated by Mr. Gardiner. Due prominence will of course be given to the fresh elucidations of Wentworth's character, in connexion with which many new facts have already been made public.

NOTES OF TRAVEL.

LIEUTENANT CAMERON has achieved a great geographical success. His letters come down to May 18; and he was to start two days afterwards for the Lualaba with the intention of following its course, believing that it will lead him to the Congo. He has sent home his journal, map, sketches, and botanical specimens. He has surveyed the whole of Lake Tanganyika, south of Ujiji, the examination of the northern part having been made by Captain Burton. He has also discovered the outlet of the lake, which proves to be a river called the Lukuga, about twenty miles south of the islands visited by Captain Speke. The current was flowing out of the lake at the rate of about 1·2 knots an hour, and the course of the river was, as is so frequently the case in Africa, much obstructed by floating vegetation. The services of Lieutenant Cameron to geography have been most important, for he is an accurate observer as well as an intrepid explorer. We trust that, for very shame, the Geographical Society will recognise the duty they owe to their zealous and gallant agent, and not, as now appears to be the intention, abandon him to his fate, after having sent him into the heart of Africa.

Not the least important of Lieutenant Cameron's services is the recovery of Dr. Livingstone's map and pocket-books which were left at Ujiji. It was ungenerously and incorrectly alleged by Mr. Waller, at the meeting of the Geographical Society on Monday, that this map was of little value. The map recovered by Lieutenant Cameron is of the greatest value, being that of the previously entirely unknown country between the Rovuma river and Lake Nyassa. Without it one of the most important portions of Dr. Livingstone's labours would have been inaccurately laid down.

We are glad to announce that Viscount Duprat, the Portuguese Consul-General in London, and a warm friend to geographical exploration, has already written to the Governor of St. Paul Loanda, and other officials on the west coast, instructing them to render all possible assistance to Lieutenant Cameron in the event of his succeeding in his chivalrous attempt to descend the Congo.

ONLY three officers have yet been selected for the Arctic Expedition. Captain Nares will command, and that officer will thus form a link between the old and the young race of Arctic naval officers. During his service, as a very young man, in the Arctic regions, on board the *Resolute*, he showed considerable aptitude in two very essential respects. He was among the foremost in providing amusements in winter quarters for the men; and he did his part manfully as a sledge traveller. We are happy to be able to announce that Commander A. H. Markham has also been selected. He was telegraphed for from Vigo last week. The third officer is Lieutenant Aldrich, who was with Captain Nares in the *Challenger*.

It should be remembered that the Arctic Expedition, after it has once passed the portals of Smith Sound, will be a little isolated world in itself, with all the requirements of the great world in miniature. Not the least important of these will be provision for the occupation and amusement of officers and crews during the winter. For much of the success of spring operations depends upon the men emerging from the winter in perfect health both in mind and body. There will cer-

tainly be a "Royal Arctic Theatre," in accordance with a good old precedent carefully followed ever since Parry wintered at Melville Island in 1819-20. We would invite the managers of our theatres here to come forward liberally in this matter, and to supply their Arctic colleague with such properties and dresses as they can spare.

A VERY important and interesting fact in botanical geography has been brought to light by the visit of Commodore Goodenough to Amsterdam Island, in H.M.S. *Pearl*, last year. Tristan d'Acunha, an isolated group of islands in the Atlantic, possesses a remarkable flora which was supposed to be peculiar to itself. Commodore Goodenough discovered on Amsterdam Island, an equally isolated spot in the Indian Ocean, a shrub called *Phyllica arborea*, which had previously been supposed to be peculiar to Tristan d'Acunha. The two places are separated by the continent of Africa, as well as by intervening oceans.

It had been intended to commence the marine surveys of India with the portion of coast bordering on the Bay of Bengal between Point Palmyras and Bimlipatam. But, owing to the delay in completing arrangements and appointing officers, it will be necessary to alter the programme. It is now probable, as the season will be too far advanced for work in the northern part of the Bay of Bengal, that the first survey will be that of the new coffee port of Colachul, on the Travancore coast; and that next the approaches to the Paumban channel, and Palk Strait, will be taken in hand. Captain Taylor (late of the Indian Navy) is the superintendent of marine surveys, and Staff Commander Ellis will be the chief surveyor afloat under him. Mr. Carrington, a most accomplished draughtsman, who has been many years in the Hydrographer's office at the Admiralty, will be superintendent of charts.

THE *South Australian Register* furnishes some details respecting Gosse's journey in Central Australia. He went over much the same ground as Giles had explored, but has added much to his predecessor's discoveries, though he agrees with him in thinking the greater part of the country traversed useless for settlers, on account of the want of water. Starting from Alice Springs on April 21, 1873, accompanied by four whites, three Afghans, and a black, he held a south-westerly course. No water was found until they arrived at Ayer's Rock, three months later. Ayer's Rock is an imposing mass of granite, about two miles long, running east and west, and abounding in grotto-like recesses in which traces of bushmen, who resort thither during the rains, were found. Some of the mountains to the north visited by Gosse proved to be higher than was imagined: Mount Gardiner, in the Reynold chain, being about 2,550 feet high; Mount Liebig, in the Mac Donnell range, about 1,900 feet above the plain, or 3,200 feet above the sea; while Mount Morris, he calculated as 3,750 feet high. During his journey he not unfrequently met some of the aborigines, and they were friendly, except on one occasion, when two of his party were attacked by about forty savages, on whom he felt compelled to fire. Gosse's general opinion of the country is that the lack of water will preclude all hope of establishing a route between the southern part of Western Australia and the line of the overland telegraph.

A RECENT number of the *Journal Officiel* contains a translation of two articles from Chinese papers, in which the writer, noticing the pressure put upon the Emperor's government by certain foreign merchants and others, to favour the introduction of railways, observes somewhat shrewdly, that in China such a step would infallibly lead to much loss of life from accidents, and that considering railways only date from 1835, Europeans are hardly justified by experience in prophesying unlimited blessings from their institution in any country.

DR. DALL, of the United States Coast Survey, recently gave the California Academy of Sciences an interesting account of some Indian mummies found in Alaska. The discovery was made by Captain Hennig, an officer of the Alaska Commercial Company. When removing some men from the island of Four Mountains, he with great difficulty effected a landing at the base of a cliff where fallen rocks formed a large cave, from which, assisted by the natives, he obtained twelve mummies in a good state of preservation, and some skulls of bodies that had suffered from exposure to the weather. The island is volcanic, and the soil in the cave was warm and the air hot. The mummies are the remains of Aleut Indians. The oldest of the mummies was deposited in the cave in the autumn before the spring in which the Russians first made their appearance at Four Mountains, rather more than a hundred years ago. This was an old chief, and many of his family had been deposited with him. One was a woman who, according to the tradition among the Indians, died in giving birth to a child prematurely, through the effects of an accident. The mummified body of a still-born child was found among the number. The bodies had been eviscerated, stuffed with grass, dried in a sitting posture, wrapped in furs and grass matting of very fine workmanship, and finally enveloped in a waterproof covering of seal-hide. The chief was in his usual dress, but covered with the wooden armour formerly worn by the Aleuts. The grass matting used to cover the mummies was finer and softer than any now made by these Indians. In the matting in which one mummy was done up into a triangular-shaped bundle, a Maltese cross was worked into a strip of another colour. This had, probably, been recently deposited in the cave, as the grass still retained its red and yellow colours. A large hoop made with wood and bone served as a base for the largest of the mummy-baskets. The best-preserved specimens appeared to have been at one time suspended in the air by cords attached to their envelopes. Lines made of sinew with which the coverings were secured were in a perfect state of preservation. Some stone knives and other implements, a child's fur shoe containing an ivory image of a sea-otter, and other carvings were also found in the cave.

THE *Geographical Magazine* for December contains a welcome announcement. From January 1 next the price is to be 1s., instead of 2s. as heretofore. That this is a change which will eventually benefit the proprietors, we cannot for a moment doubt. A shilling is the recognised price for most monthly magazines, and various events have combined during the last few years to lend so much interest to the study of geography that, in our opinion, the reduction in price offers every prospect of a large increase of popularity for our contemporary. A perceptible improvement of style is to be seen in the maps: the one presented to the readers this month being a well-drawn and executed map of the new Arctic land discovered by the Austro-Hungarians. The paper illustrated by it is the same as that read by Lieutenant Payer before the Royal Geographical Society. The most noticeable article in the number is one with the appropriate heading "From China to Peru." This paper, which bears the author's name, deserves careful attention on the part of the Aborigines Protection Society, who have recently raised such a vigorous outcry against the employment of Indian coolies in Peru. The author points out the systematic measures taken by the Peruvian Government to regulate the Chinese coolie traffic. To this he adds much valuable knowledge acquired by himself on the spot respecting the character of the Peruvian proprietors, and the nature of the reforms adopted by them for the protection of the emigrants. He adduces a good proof of the contentedness of the Chinese settled in Peru in the fact of their having in August last presented an address to the President on the occasion of his completion of his

second year of office, and warmly expressed their gratitude for the guarantees and protection secured to them. A short description of the new guano deposits in Peru follows, from which we observe that the value of these deposits amounts to 55 millions, or considerably more than the whole public debt of Peru. The number concludes with the usual careful notices of geographical books, and the work of geographical societies, both in this country and abroad.

PETERMANN'S *Mittheilungen* for December contains a communication from Lieutenant Weyprecht, in which he draws three conclusions from the recent Austro-Hungarian Arctic explorations. These are, first, that all theories about an open Polar Sea are as untenable as any hasty assumptions that the pack-ice southward of Francis-Joseph Land is impenetrable. Secondly, all conclusions which attribute the drift of the *Tegethoff* to the action of the Gulf Stream are utterly erroneous. Thirdly, Weyprecht still holds to the possibility of extensive exploration by way of the Siberian coast. He also states that the name of Weyprecht Island (given by Dr. Petermann to a small island south of the winter quarters of the *Tegethoff*), has been fixed without his authority, and requests that it may be withdrawn. Lieutenant Payer also contributes his views, which are that the best chance of achieving a high latitude is *via* Smith Sound, as urged by the English and Americans.

The continuation of the account of Lieutenant Wheeler's travels through New Mexico and Arizona is given, as well as an extract from Captain Nares' last official reports on the voyage of the *Challenger*. This last paper is illustrated by a semi-circumpolar map of the Antarctic regions, similar to the one by Signor Cora in the last number of the *Cosmos*.

BOSTON LETTER.

Boston : Nov. 18, 1874.

PROFESSOR WHITNEY'S *Oriental and Linguistic Essays*, Second Series, appeared last week. The most interesting of these essays are those on the lunar zodiac of India, Arabia, and China; the accent in Sanskrit; the elements of English pronunciation; and there are also reviews of Professor Max Müller's *Chips from a German Workshop*, and of Mr. Cox's *Mythology of the Aryan Nations*. In the essay on the lunar zodiac, Mr. Whitney writes with his usual critical caution, finding every theory unsatisfactory which derives either of the three systems—the Hindu, the Chinese, or the Arabian—from one of the others. In his opinion "the way is left open to anyone to prove, by good and sufficient evidence, that either" they or "that some fourth people, different from them all, may claim the honour of being inventors of an institution so widely diffused, and forming a cardinal element in the early astronomical science of the most important and cultivated races of Asia." He agrees with Weber in thinking it unlikely that the Hindus deserve the credit of originating the system; but this, he says, is merely an opinion rather than a settled conviction resting on satisfactory proof.

The essay on the elements of English pronunciation gives in full the interesting results of the investigations to which brief reference was made in my first letter. Mr. Whitney says, among other things:—

"The English is sometimes accused of an unpleasant predominance of hissing or sibilant sounds; and not without some reason, since the sum of sibilant elements amounts to nine and a half per cent., or nearly one-tenth of our whole utterance. In French, however, according to my reckoning, the proportion is even a shade larger, and in ancient Greek it was over twelve per cent.; of our modern Germanic relatives, the German and the Swedish have each about six per cent."

He gives a complete table of the scale and rate of frequency of English sounds, formed by the selection of ten passages, five in prose and as many in poetry, from authors of various periods. For

the standard of pronunciation he has taken his own, which he describes in full, and which represents very fairly the New England method of utterance. Objection might be made to his putting such words as *fruit*, *rheum*, and *brew* in the same class with *few* and *pure*, as representatives of the *u*-sound mixed with a preceding *i* or *y*-sound.

The reviews of the two books mentioned above are not wholly favourable, but they present a marked contrast to the Billingsgate with which Professor Steinthal, in his recent pamphlet, has seen fit to reply to his critic. This volume, it will be seen, confines itself to other classes of subjects than those treated in its predecessor. Of those essays Mr. Whitney says that "though they have provoked in one or two quarters a certain amount of vituperation, they have not been met on their own ground, of fact and argument." This volume is much less aggressive in tone than the other, and it is none the less valuable on that account.

In lighter literature there will soon appear in book-form Mr. Howells' *A Foregone Conclusion*, which for this last half-year has been coming out in the *Atlantic Monthly*. An earlier novel by Mr. Howells met with great success in this country a year or two ago: its name was *A Chance Acquaintance*. The story was a simple one, of the adventures of a young woman from the West who, while travelling in Canada with her married sister and her brother-in-law, meets a haughty citizen of Boston who falls in love with her and becomes engaged to her. In time there appear some ladies of more conventional elegance who make him ashamed of his betrothed, and the novel ends with their separation. This slender outline is filled in with delicate humour and gentle abuse of the peculiarities of the male sex of this town, and there is so natural a young girl for heroine that the book became very popular. Its good descriptions of Canada have made it an inseparable guide-book for Americans visiting that country. This later story, however, marks a considerable advance. The scene is laid in Venice, where Mr. Howells was American consul for four or five years. The most prominent character in the story is an Italian priest, Don Ippolito by name, who is a sceptic in religion, is very much interested in mechanics, and who looks to America with vague longing as to a land of promise, where he may prosecute his inventions, and thus secure his support free from the trammels of the church, which is fast becoming hateful to him. This feeling is soon intensified by the fact that he falls in love with a young American girl to whom he gives lessons in Italian. This girl is a charming creature, ardent, impulsive, and the soul of truth. When Don Ippolito confesses to her that he has no belief in the church, that his life is a lie, her horror at the deceit is only equalled by her pity for the sinner, and she urges him to leave the church, and to betake himself to this country. He is misled by her ardent expression of sympathy to declare his love for her. Such a love as Don Ippolito's, however, could have but one end. Although the girl has urged him to cease to be a priest, she cannot help regarding him as one, and he leaves her presence a heartbroken man. The girl herself is very attractive—she is by no means one of the American girls Mr. Ruskin laughs at—but the main charm of the book lies in the way Don Ippolito is drawn. All through the story the reader feels the hopelessness of the poor man's love, but he is set before us with so much sympathy and delicacy that it is impossible not to be interested in him. This is really a pathetic story of great beauty, and it has the rare advantage of being an American novel which can stand on its own merits without needing any superfluous aid of local colour to make it popular. It is a story of real merit, the best, indeed, that has appeared in this country since Hawthorne's time. There is no pretentiousness about the book; it is merely a pathetic story of an impossible love affair; but in

spite of all the attempts that are made to write just that, those who come so near the mark are very few.

I see that Mr. Longfellow's *The Hanging of the Crane* is announced in London. The poem has the pleasant grace that we have learned to expect from this author; the illustrations are somewhat better than usual. Mr. Longfellow is sure of striking a certain note, but those who undertake to aid his text by their illustrations often fall very far short of their intentions. In this case, however, the little sketches of domestic life suit the poem, and show more care and unanimity on the part of artist, engraver, and publisher than are sometimes found.

CORRESPONDENCE.

SHELLEY AND PETER FINNERTY.

In 1872 Mr. D. F. MacCarthy published his serviceable and very painstaking work, *Shelley's Early Life*, chiefly (it may be said) for the purpose of showing that a now untraceable poem, named *A Poetical Essay on the Existing State of Things*, by a Gentleman of the University of Oxford, brought out in 1811 "for assisting to maintain in prison Mr. Peter Finnerty, imprisoned for a libel," was written by Shelley. I reviewed Mr. MacCarthy's book in the ACADEMY (December 1, 1872, No. 61), expressing the opinion that he had fairly made out his case. I need not here go over the same ground. Suffice it to say that Mr. Finnerty was an Irish journalistic patriot, who was lying imprisoned in Lincoln jail within the period (1810-11) of Shelley's university career—his sen-

tence having been passed on February 7, 1811; and that Mr. MacCarthy's argument amounts briefly to this: Shelley can be shown to have published some poem for the benefit of Mr. Finnerty; the *Poetical Essay on the Existing State of Things* was published with the same object; various details favour the surmise that it might have been written by Shelley; therefore, in the absence of any evidence to the contrary, we may reasonably believe that he *did* write it.

I now find a strong (I think, a conclusive) confirmation of Mr. MacCarthy's ingenious and inciting suggestion. Moreover, there appears ground for thinking that Shelley published for the benefit of Mr. Finnerty, not only the unknown *Poetical Essay*, but also the well-known *Posthumous Fragments of Margaret Nicholson*. The new evidence on both points is as follows.

A work published by Mr. Colburn in 1838, named *A Diary illustrative of the Times of George IV.*, contains the ensuing passage (vol. i. pp. 54-56). It occurs in a letter signed C. R., from Christ Church, Oxford, dated March 15, 1811:—

"Talking of books, we have lately had a literary sun shine forth upon us here, before whom our former luminaries must hide their diminished heads—a Mr. Shelley, of University College, who lives upon arsenic, aqua-fortis, half-an-hour's sleep in the night, and is desperately in love with the memory of Margaret Nicholson. He hath published what he terms the *Posthumous Poems*, PRINTED FOR THE BENEFIT OF MR. PETER FINNERTY; which, I am grieved to say, though stuffed full of treason, is extremely dull. But the author is a great genius; and, if he be not clapped up in Bedlam or hanged, will certainly prove one of the sweetest swans on the tuneful margin of the Charwell. . . . Shelley's style is much like that of Moore burlesqued, for Frank is a very foul-mouthed fellow, and Charlotte* one of the most impudent brides that I ever met with in a book. Our Apollo next came out with a prose pamphlet in praise of Atheism, which I have not as yet seen; and there appeared a monstrous romance in one volume, called *St. Irvyne, or the Rosicrucian*. Here is another pearl of price! All the heroes are confirmed robbers and causeless murderers; while the heroines glide *en chemise* through the streets of Genoa,† tap at the palazzo-doors of their sweethearts, and, on being denied admittance, leave no cards, but run home to their warm beds, and kill themselves. If your Lordship would like to see this treasure, I will send it. Shelley's last exhibition is A POEM ON THE STATE OF PUBLIC AFFAIRS."

Here we find it stated unmistakably that Shelley published *Margaret Nicholson* for the benefit of Mr. Finnerty; also that he had written "a poem on the state of public affairs," which the most cautious investigator, cognizant of the evidence adduced in Mr. MacCarthy's book, will not, I think, hesitate to identify with the *Poetical Essay on the Existing State of Things*, advertised in the *Oxford University and City Herald* of March 9, 1811, as brought out "by a Gentleman of the University of Oxford for assisting to maintain in prison Mr. Peter Finnerty, imprisoned for a libel."

The letter of C. R. is also interesting as showing with great distinctness how strong an impression Shelley's genius had made in the university; he was accepted as a predestined admirable poet, notwithstanding (for it was certainly not in virtue of) those heinous performances *Margaret Nicholson* and *St. Irvyne*—the latter of which is described by the writer in amusing and not far from accurate terms. Perhaps the clear perception of the influence which Shelley's genius and ardour must have upon his fellow-students weighed with the

* "Frank" is no doubt François Ravallac, and "Charlotte" Charlotte Corday: one of the poems in the *Margaret Nicholson* volume being an epithalamium for these denizens of Hades. The abrupt way in which, in the printed letter, these names are introduced by C. R., seems to show that the printer must have erased some other details bearing upon Shelley: not any of those that he gives are omitted in our citation.

† Misprinted "Genoa" in the *Diary*.

authorities of University College when they expelled him on account of his pamphlet (here also mentioned), *The Necessity of Atheism*. The phrase about "arsenic, aqua-fortis, half-an-hour's sleep in the night," bantering though it is, confirms what we previously knew, from other sources, of Shelley at this period.

I find only one other reference to Shelley in the *Diary illustrative of the Times of George IV.* A letter signed C. K. S. (but, it might seem, really written by this same "C. R."), from Christ Church, Oxford, dated October 1811, contains the following:—

"Meanwhile be it known unto you that the ingenious Mr. Shelley hath been expelled from the University on account of his atheistical pamphlet. Was ever such bad taste and barbarity known? He behaved like a hero. 'He showed to Fortune's frowns a brow serene,' and declared his intention of emigrating to America. I send his Romance; which would have reached you sooner, had not an impudent person cribbed it from my rooms."

To this passage (at the words "emigrating to America") the editor of the *Diary* has added a foot-note, which I transcribe exactly for your readers' diversion, even down to the triple note of admiration which terminates it:—

"In my opinion, Mr. Shelley merited the opinion* here formed of him. Nevertheless he had genius, he had power. But his genius was an evil one, and his powers were directed to a bad end, or (what was the same in effect) to no end at all. The best parts of his phrenzied compositions have all the deleterious qualities of alcohol; and Hamlet would scarcely think it necessary to apostrophize his shade in the questioning words—'Bring'st with thee airs from heaven, or blasts from hell.'—But *de mortuis*: he was drowned in a storm!!!"

The statement of C. K. S. that Shelley, when about to be expelled, "declared his intention of emigrating to America," is new to me.

The date of the second letter—October 1811—deserves a moment's notice. Shelley was expelled from Oxford on March 25, 1811. Yet C. K. S., writing seven months after the event, refers to it as if it were the last Oxonian news. Perhaps the assigned date is wrong, as well as the initials. The advertisement prefixed to the *Diary illustrative of the Times of George IV.* shows that the editor through whose hands the materials of that work first passed had purposely altered them in some respects; in especial, changing dates, and giving to letters which were really written by one woman to another the character of letters written by one man to another. W. M. ROSSETTI.

AN ALLUSION IN "HAMLET."

4 Victoria Road, Clapham: Dec. 12, 1874.

Mr. Furnivall's note upon Hamlet's introduction to the murderer's speech in the sub-play is of itself a striking illustration of a principle which I hope the New Shakspeare Society will not lose sight of—that the work of commenting should be postponed to the work of gathering materials. Hamlet does not quote any passage of the old play of the same name, but he does roll into one two lines of another old play, doubtless as familiar upon the Elizabethan stage. In the *True Tragedie of Richard the Third* is a speech of the King to the Lord Lovell, describing the terrors of his conscience, and his "hell of life":—

"Methinks their ghosts comes gaping for revenge

Whom I have slain in reaching for a crown."

Clarence, and his nephews, and the headless peers, all mankind, all nature, the sun, moon, birds, beasts, all clamour for revenge:—

"The screeking raven sits croaking for revenge

Whole herds of beasts comes bellowing for revenge."

I think that no one can doubt that Hamlet's line "The croaking raven doth bellow for revenge,"

* The editor evidently means "the unfavourable opinion;" though in fact no opinion regarding Shelley's character is expressed by C. K. S.

is a satirical condensation of these two lines. The speech is to be found at p. 61 of the [old] Shakespeare Society's reprint of the play.

RICHARD SIMPSON.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Dec. 19,	1 p.m.	Sale at Christie's of the Collection of Pictures formed by the late T. C. Molyneux, Esq.
	3 p.m.	Crystal Palace Concert (Ouseley's <i>Harar</i>).
	"	Saturday Popular Concert, St. James's Hall (Schubert's Octett; Billow).
	8 p.m.	Royal Albert Hall (Irish Festival).
MONDAY, Dec. 21,	8.15 p.m.	Mr. Phelps as Falstaff in <i>The Merry Wives of Windsor</i> at the Gaiety.
	8 p.m.	Medial.
	"	Society of Arts; Cantor Lecture (Dr. B. W. Richardson on "Alcohol, its Action and Use").
	"	Royal Albert Hall: Ballad Night.
TUESDAY, Dec. 22,	8 p.m.	Civil Engineers: Annual General Meeting.
	"	Anthropological Institute: Col. A. Lane Fox on "Early Modes of Navigation, tracing the Development of Ship Forms."
	"	West London Scientific Association: Mr. B. Thompson Lowne ("A Sketch of the Anatomy of Insects").
	"	Royal Albert Hall: English Night (New Symphony by G. Lohr).
WEDNESDAY, Dec. 23,	3 p.m.	Dr. Billow's Recital (St. James's Hall).
	8 p.m.	Royal Albert Hall: Classical Night (Mendelssohn's Reformation Symphony; Mme. Norman-Neruda).
THURSDAY, Dec. 24,	8 p.m.	Royal Albert Hall (<i>Messiah</i>).

SCIENCE.

Annales des Rois d'Assyrie. Par M. Joachim Ménant. (Paris: Maisonneuve & Cie., 1874.)

ONE of the most remarkable achievements of the present day has been the rapid progress made in the decipherment of the Assyrian inscriptions, and the startling results already obtained from it. Not much more than twenty years has passed away since the ruins of the great cities of the Tigris were laid open by Botta and Layard; but these twenty years have been sufficient to revolutionise our ideas of ancient history, and to make us almost as well acquainted with Sennacherib and his subjects as with the Norman kings of England. We possess contemporaneous records of the Assyrian monarchs from an early period down to the closing days of the Empire, besides chronological tables which range over more than 200 years, and have enabled us not only to fix the dates of Assyrian history, but also to correct the chronology of the Old Testament, hitherto the despair of historians. Assyria took its name from Assur, "the water-border," the primitive capital of the country, now represented by Kalah Shergat. It was the Ellasar, or Al Assur, of Genesis, over which Arioch was king. Its rulers were termed *patesis*, or "viceroys," and it was not until the sixteenth century B.C. that the monarchy of Assyria, properly so called, was founded, apparently by Bel-sumili-capi, whom M. Ménant erroneously names Bel-kat-irassou. One of the princes of this line overthrew the Elamite power in Babylonia (B.C. 1270), and established the Assyrian dynasty there which

lasted to the eighth century. A hundred and fifty years later lived a Tiglath-Pileser, whose annals have been preserved in a very complete state, and whose conquests extended from Chaldaea and Susiana to Cilicia and Cappadocia, then inhabited by the Tibareni and Moschi and their five kings. Shalmaneser, who reigned from 857 to 822 B.C., was the first to come into contact with the Israelites. Ahab and his forces formed part of a confederacy, under the leadership of Benhadar of Damascus, which was defeated in 853; and we may see the Israelites bearing the tribute from Jehu sculptured upon the Black Obelisk which now stands in the British Museum. Shalmaneser's dynasty ended in 727, when Tiglath-Pileser seized the crown, and carried his arms southward and westward, exacting tribute, among others, from Menahem of Samaria, whose conqueror has been transformed into Pul in the text of the Second Book of Kings, by the mistake of some early copyist. Tiglath-Pileser was followed by Shalmaneser, who laid siege to Samaria; but he died during the campaign, after a reign of five years, and the city was eventually taken by Sargon. Sargon claims also the conquest of Judaea; and the fragment of an unpublished cylinder, with which M. Ménant does not seem to be acquainted, tells us that the subjugation of Palestine took place in consequence of an alliance formed against Assyria by Judah, Edom, Moab and the Philistines, in conjunction with Egypt and Ashdod, the siege of which is alluded to in Isa. xx. Sargon was murdered, like his son and successor Sennacherib, who rebuilt Nineveh, and covered the walls of his palaces with the records of his victories. It was under his grandson, Assurbanipal or Sardanapalus, however, that the Assyrian Empire attained its culminating point; the ancient kingdom of Elam was devastated and overthrown, Egypt was ruled by Assyrian satraps, and Gyges of Lydia sent tribute to Nineveh. But signs of internal decay were already beginning to show themselves; the royal patronage of literature and science went hand in hand with the increase of luxury; and even during the reign of Assur-bani-pal himself, more than one revolt shook the monarchy to its foundations. Before the end of the century Nineveh saw itself encircled by the besieging armies of Media and Chaldaea, and the supremacy in Western Asia passed into the hands of the insurgent viceroy of Babylon.

The details of these events may now be read in the contemporaneous chronicles left us by the actors themselves. Most of the historical inscriptions have been published either in England or in France, and the general public will be able to study them by means of the translations given in M. Ménant's work. M. Oppert attempted some years ago to make the monuments tell their own story, and thus put the materials for the reconstruction of Assyrian history into the hands of everyone. The work has been taken up by M. Ménant; and the result is a handsome volume, with all the charm of type and paper for which the author is famous, containing the annals of Assyria literally translated from the inscriptions. The main bulk of the translations will be accepted by every Assyrian scholar, what-

ever difference of opinion there may be as to the sense of individual words or expressions. We are rejoiced to find that M. Ménant receives the native chronology, and refuses to tamper with the lists of yearly eponymes in order to harmonise them with the dates of the Old Testament. But why should he make the unfounded statement (p. 7) that "the name of Hoshea" is found among the tributaries of Shalmaneser? or place Accad in Northern Mesopotamia, and call it by the doubtful name of Chalauneh? It is refreshing, too, to meet with a writer who still believes in the personality of Shem and Asshur in spite of the monumental evidence to the contrary. We must not forget to add that the book is enriched by excellent maps and plans of the Assyrian world and the chief cities of the country, or to recommend to the historian what he will find an extremely useful work.

A. H. SAYCE.

UNIVERSITIES COMMISSION REPORT.—VOLS. II. AND III.

THESE two volumes, which conclude the labours of the Royal Commissioners who were appointed nearly three years ago to enquire into the revenues of Oxford and Cambridge, contain the actual returns and answers furnished by the Universities and Colleges to the elaborate sheets of interrogatories addressed to them. They are the very figures and words of the corporate officials, and therefore are entirely free from any imputation of having been manipulated by the Commissioners, and must form the most trustworthy materials for all enquirers into these interesting matters, though a useful introduction to their study is afforded by the first volume of the Report, containing the abstracts and synoptical tables framed on the authority of the Commissioners from these returns, which has been already twice noticed in these columns. The two present volumes weigh together eight pounds avoirdupois in their unbound form, and contain more than 1,400 pages, closely packed with figures, account sheets, and agricultural details. This enormous amount of statistical information, which forms a University Domesday Book and something more, is all arranged in an intelligible shape, and under appropriate headings; but, of course, the limits of our space do not permit us to do more than draw attention to such of the facts here recorded as are most important or interesting. The volume devoted to Oxford is the larger by nearly 400 pages, a circumstance which is to be accounted for not only by the greater number of colleges and halls at that place, and their greater wealth, but also by the fact that the University of Oxford has returned the accounts of its corporate and trust property with most extraordinary minuteness, and that New College and Lincoln have volunteered intricate forms of account which involve a considerable amount of repetition. At Cambridge, on the other hand, Sidney Sussex College occupies only two pages, for Dr. Phelps, the master of that college, who is also bursar, refused in an entertaining correspondence here published to fill up the questions of the Commissioners within any given limit of time, and contented himself with sending to them a polemical pamphlet of his own composition, concerning which he writes in the following style of ponderous badinage:—

"It was perhaps a too ambitious thought, but I hope nevertheless I may be pardoned if I confess that there was something irresistibly attractive to me in the idea of my poor little brochure finding itself embalmed for ever *in extenso* in a huge blue book, and deposited in the national archives where those inestimable treasures are preserved."

It is hardly necessary to add that the Commissioners have not favoured Dr. Phelps's project

of literary immortality, though they have used the figures of his pamphlet so far as they could in the preparation of their own abstract.

The greater wealth of the University of Oxford is made very clear in these returns, and also the fact that it is from endowments that this advantage is obtained; for Cambridge receives in dues and fees from its members nearly 20,000*l.* a year, and Oxford only 18,000*l.* The superfluity of wealth at Oxford would seem to have induced that University to indulge in considerable purchases of land, for within the last thirteen years it has not only bought land in the High Street of Oxford on which to erect new Schools, but also an agricultural estate at Elmley, in Kent, of 2,500 acres, and building ground in Oxford for seventy-seven small houses. It also owns a fishery in the Cherwell, let for 15*l.* Two curious items in the accounts of this University for the year ending 1868 are: "The Mayor of Oxford, towards expenses of soldiers during riots, 31*l.*;" and "expenses of division of police from London, for Commemoration on occasion of the visit of H.R.H. the Prince of Wales and the Crown Prince of Denmark, railway fares 118*l.*, refreshments 38*l.*" Those yet *in statu pupillari* will be interested to learn that the fines exacted by the proctors at Oxford average about 315*l.*, varying between the wide limits of 44*l.* and 240*l.*; whereas at Cambridge these fines, for the one year which is alone given, amount only to 130*l.* The proctors and pro-proctors receive proportionately 1,000*l.* and 724*l.* at the two Universities, so that to the undergraduate mind there will appear some ratio between pay received and work done. The expenses of the Spinning House at Cambridge reach altogether 320*l.* a year; but at Oxford, "maintenance of prisoners confined by the authority of the University in city gaol," which seems to be the analogous item, costs 32*l.* The stipends to the various public officers at the latter University are throughout on a higher scale, and the examiners collectively receive nearly 800*l.* more than at Cambridge, where the mathematical tripos demands on this account not more than 236*l.*, while the classical honour final examination at Oxford, which occurs, it is true, twice in the year, requires 313*l.* It may further be noticed that the sites of the Logic School and the Botanic Garden at Oxford are held by the University from Magdalen College on two beneficial leases, which the college has refused to renew, and consequently they will both expire within the next twenty years.

The returns of the individual colleges are so voluminous, and so largely consist of the details of their landed property, its condition, and management, that no adequate idea even of their general character can be concisely given. They comprise the acreage of the estates, their situation, the buildings upon them, the name of lessee, duration of lease, rent, rateable value, with many other minor details. The external sources of income are arranged under no less than sixteen headings, of which the most important are estates on beneficial leases, and at rack rent; houses on beneficial leases, long leases, and at rack rent; copyholds for lives, and of inheritance, and tithe rent charges. The internal sources of income are not set out with the same regularity, and it is therefore difficult to obtain any rough estimate of the proportion between the income received from the members of a college, and the corresponding expenditure. Nine colleges only at the two Universities return the amount of the "gate fines" as a distinct item, and adding all of these together, they are on an average less, by considerably more than one-half, than the sums paid in porters' salaries. At Emmanuel, Cambridge, the gate fines come to only 30*l.*, and the porters receive 140*l.*; whereas, at Exeter, Oxford, these items are respectively 227*l.* and 169*l.* At Magdalene, Cambridge, the chapel fines appear to be very large, in 1868 amounting to no less than 154*l.*, being just one-sixth of what was received for tuition. The master of this college is credited with a peculiar

addition to his salary under the name of poundage, being five per cent. on the cost price of bread and beer. At Trinity, Cambridge, fines levied for various breaches of college discipline averaged 500*l.*, but neither at Christ Church, Oxford, nor at St. John's, Cambridge, is an analogous entry to be found. The expenditure out of corporate income is returned with the same irregularity as the internal receipts. Some colleges include under this title many of the expenses of management, &c., such as the permanent outgoings on estates and rent dinners; some pay their common-room servants out of corporate revenue, while others do not pay any of their servants from this source; and many, including a majority of the Cambridge colleges, set aside a certain percentage out of divisible revenue for a reserve fund, which they call by many different names. Owing to these various modes adopted for keeping accounts, it is almost impossible to institute any fair comparisons, but it may be perhaps calculated that the Cambridge colleges spend more than twice as much as those at Oxford on "extraordinary entertainments," the total amount at the two Universities being 4,726*l.*, and the average respectively 192*l.* and 87*l.*, the highest at Cambridge being St. John's with 898*l.*, and at Oxford Queen's with 206*l.*, while some colleges spend either nothing, or a trifling sum. Even the inferences to be drawn from these figures are not really quite so clear as they seem, and the heading under "ordinary commons and fixed allowances" is yet more delusive. A report of a committee at All Souls' College, here reprinted, reveals some of the secrets of the bursary, and suggests the astonishing conclusion that, through the means chiefly of an euphemistically named "song book," about 1,800*l.* is annually paid from corporate income toward the kitchen and common-room expenses of the Fellows, and to this 400*l.* more may not unfairly be added for the salaries of the servants in the kitchen and buttery departments, for not much of this can be apportioned to the four undergraduate members of the college. At Worcester, on the other hand, the Fellows receive absolutely no advantage from such sources. Among the more curious items of expenditure may be noticed—at Magdalen, Oxford, 60*l.* for candles for the chapel, 400*l.* for the gardens and the walks, 70*l.* for portraits of Bishop Philpotts and Dr. Daubeny; at New College, 98*l.* for the Progress, including outriders' fee; and at the same college an average of 75*l.* is obtained in sconces from scholars, applied to the exhibition fund, and there is a casual receipt of 10*l.* for the shooting of Widdington Wood. At Cambridge, Trinity pays about 40*l.* a year for the entertainment of the judges at the assizes, and St. John's has obtained for 50*l.* a bust of Sir John Herschel.

With reference to the landed property of the colleges, the returns from Cambridge are both the more simple and the more minute. Their estates are smaller, better situated for supervision and for agricultural profit, and mostly at rack rent. The characteristics of the system of beneficial leases, which is still so prevalent at Oxford, are indicated in certain remarks appended by the bursar of Christ's, Cambridge, to his account of the college property in Leicestershire of 1,500 acres in extent, formerly let in one beneficial lease:—

"The grand lessee had the power of granting beneficial sub-leases; and the present occupiers and their forefathers have in many instances been occupiers on the estate for several generations. The estate is much more subdivided than is desirable, the land is in a poor state of cultivation, and the farm-buildings are of an inferior description and in bad repair; the cottages also are very poor and in bad repair."

The change to the rack-rent system not only demands that the thrice-recurring fines must be foregone, but also a large immediate expenditure on improvements. The bursar of St. John's, Oxford, thus describes a farm, now let at rack-rent, of about 500 acres,

"formed on the expiration of various beneficial leases and the dropping of lives. The land was generally in

a very bad state, and the buildings unfit for present occupation. In order to obtain a substantial tenant, the college covenanted to erect a good dwelling-house and a large set of farm-buildings, as well as to drain the land and cut down all the copses and grub up many of the hedges. These operations, which necessitated a loan of 4,500*l.*, have been entirely successful; and when the charge is paid off (as it will be in thirty-one years, interest with principal at 6 per cent.) will be very profitable to the college."

The bursar of Magdalen College also estimates—"that when the beneficial leases fall in, the value of such property will be increased by at least one-half, after taking into account the expenses which will be entailed on the college for new buildings, &c. When the copyhold property held upon lives falls in, the worth of the land will, it is presumed, be increased fivefold."

Despite these circumstances, which are notorious at the Universities, Brasenose still retains the old system for rather more than 87 per cent. of its entire property, and thus receives from these estates only 14*8.* 4*l.* per acre; whereas the Commissioners have calculated that these same estates, if changed to rack-rent, would within twenty years give an increase to the income of the college of at least 9,000*l.* a year, which is more than double the present income. From tithe rent-charges some of the colleges receive a large portion of their revenue, in the case of Trinity, Cambridge, amounting to as much as 26,000*l.*; and these also have been let on beneficial leases, often at a nominal rent to the incumbents of the parishes from which they issue, in which case they are merely augmentations of benefices, though not so returned. The number of copyholds for lives is proportionately very great, and as the colleges, with hardly an exception, are allowing the lives to drop, these properties, except in the case of cottage copies, will soon be turned into freehold. Copyholds of inheritance are much less frequent, and their value is comparatively small, but as yet the privilege of enfranchisement has in few cases been resorted to.

A considerable amount of real property law, and of mediaeval usages might be gathered from these volumes by a curious student. The extensive powers of a tenant in fee may be illustrated by an estate belonging to St. John's, Oxford, which was conveyed to the college in 1636 subject to a lease for 300 years, at a reserved rent of 200*l.* The names of free bench, borough English, customary tenant right, executor's year, tenure by the curtesy, heriots, and quit rents, constantly recur in the case of the copyholds; and the common law obligation of the parson to keep chancels in repair causes a regular deduction from the gross amount of tithe rent-charges. The returns of Brasenose show that the existence of heriots is not confined, as has often been erroneously supposed, to lands of copyhold tenure, and also disclose a mysterious accompaniment to these heriots by the name of "brawners." It may serve perhaps to illustrate this item, to state that Merton receives from its house property in Holywell Street, Oxford, fifteen capons a year by way of part payment of rent, and that in the case of all old beneficial leases a certain proportion of the reserved rent is payable in wheat and malt. Trinity, Cambridge, for example, receives for the tithes of Cuxwold, in Yorkshire, a fine of 4,000*l.*, a rent of 20*l.* in money, 79 quarters of wheat, and 105 quarters of malt. The accounts of Lincoln College are presented in their original Latin, curiously interspersed with modern English. Among the items of annual recurrence are the following:—

"Exposita pro focalibus calcei-teroris, 1*l.* 10*s.* Chapel marker, 5*l.* Pro carne suilla et ostreis, 17*s.* Domus wine bill, 12*l.* 9*s.* 6*d.* Solutio Rectori pro visitatione apud Combe, 6*s.* 8*d.* License for college arms, 1*l.* 1*s.* Majori et camerariis Oxon., pro portione terrae infra situm Collegii et pro acquit, 1*s.* 2*d.* Brown, ironmonger, for common room lamp, 4*l.* 16*s.* 6*d.*"

Christ Church receives many quit rents for land within the city of Oxford, among which may be noticed "from the Professor of Botany, 4*l.* for encroachment in the meadow," and "from the

Union Society, *Id.*" Nowhere among the returns is there to be found any allusion to the value of the college plate, nor do the Commissioners comment upon this omission, for the fault is their own.

JAMES S. COTTON.

THE WASHINGTON ACADEMY OF SCIENCES.

If Boston deserves to be regarded as the literary centre of the United States, and New York as our commercial metropolis, it is equally safe to say that Washington is the scientific as well as the political capital of the country. In no other city of the Union can there be found so many institutions devoted to the pursuit of both practical and theoretical science. In support of this statement, I need but enumerate the Smithsonian Institution, the National Observatory, the Bureaux of the Coast Survey, of the Nautical Almanac, of Weights and Measures, of Statistics, of Navigation, and of Steam Engineering; the Patent Office, the Census Office, the Hydrographic Office, the Signal Corps Office, the Engineer Department and the Ordnance Department of the Army, the Medical Departments of the Army and Navy, the Agricultural Department, the Botanical Gardens, the Lighthouse Board, &c. &c. And connected with these several institutions are found valuable special libraries, as well as apparatus and collections for the promotion of original research in the walks of science and art to which they respectively pertain. It hardly needs to be added that in no city of the United States, considered in proportion to the number of its inhabitants, can so large a body of men be found actively engaged in the pursuit of science as in Washington; and it gives one pleasure to say that, among these scientific workers, a considerable number are devoted to *original* investigation in the fields which they are specially called to cultivate.

Among the scientific institutions of Washington there is, of course, no one which is so widely known as the institution built on the foundation of the bequest left to the Government of the United States by James Smithson, a British subject (he was the natural son of the third Duke of Northumberland), who died in the year 1829. The condition on which the bequest was to take effect in favour of the United States did not occur until the year 1835, and it was not until three years later that Mr. Rush, the American Minister, was able to deposit the legacy in the Federal Treasury at Washington. The proceeds of the legacy as thus deposited yielded the sum of 515,169 dollars—somewhat more than 100,000*l.* By additions made to this sum from the accrued interest, it was subsequently raised to 655,000 dollars, and in the year 1846 the Institution was formally organised by Act of Congress, and placed under the direction of Professor Joseph Henry, the most eminent scientific man in the United States.

By the terms of his will Smithson had bequeathed his property to the United States of America, "to found, at Washington, under the name of the Smithsonian Institution, an establishment for the increase and diffusion of knowledge among men." There were no other guiding words to regulate the disposition that should be made of his bequest, but Professor Henry in his conduct of the Institution has consistently maintained that these words point to the erection of an establishment which was designed by the testator for the benefit of all mankind, and that it should be equally devoted to the *increase* and to the *diffusion* of knowledge in all departments of enquiry. And under his wise and efficient direction the annual income of the fund has been devoted in the first place to the increase of knowledge in all departments, by the promotion of original research in each, and then to the dissemination of any and all scientific gains thus acquired, by means of the press, under the form of "*Transactions*," "*Collections*," "*Reports*," or "*Contributions*."

The policy thus impressed on the Institution has now been in operation more than a quarter of a century, and has yielded results which sufficiently confirm its wisdom. By a judicious expenditure of the small revenues annually placed at his command, Professor Henry has been able to touch the springs of original investigation in almost every department of scientific research, and the positive results of these investigations have been diffused throughout the whole civilised world by the valuable publications issued under the auspices and in the name of the Institution. In determining the appropriations to different objects of research, the advice of persons of established reputation in the different branches of scientific pursuit is sought by the Director, and in all cases, before an article, memoir, or contribution is accepted for publication, it is referred to a commission of experts, who report upon its fitness for adoption by the Institution as containing an addition to the existing stock of knowledge in the department to which it belongs. In the field of natural history it has been the established usage of the Director to make large collections of specimens illustrating the fauna and flora of the American continents, and then to make these specimens up into sets for distribution to scientific and educational institutions in all parts of the world.

From the last annual report made by Professor Henry to Congress, I cite the following paragraph:—

"One prominent maxim of the Institution has been 'co-operation not monopoly,' and another, 'in all cases, as far as possible, not to occupy ground especially cultivated by other establishments,' or, in other words, not to expend the money of the bequest in doing that for which provision could be obtained through other means. To gratify men of literature as well as to advance an important branch of knowledge, from the first much attention has been given to anthropology, including linguistics, antiquities, and everything which tends to reconstruct the history of man in the past: this being a common ground on which the man of letters and of science could meet as harmonious collaborators.

"From the foregoing sketch it will be evident that the theory of the Institution is that of an ideal establishment for the collection of facts, the elaboration of these into general principles, and a diffusion of the results among men of every race and of every clime. That an institution of this character, in which the accumulation of ideas and not merely of material objects is the great end, should not have been properly appreciated at first in a country so eminently practical as ours is not surprising. But we are happy in knowing it has been from year to year growing in public estimation, and we are encouraged to cherish the belief that it will not only realize the ideas of the benevolent founder of the Institution, but also serve as an example of imitation, while the errors which may have been committed will also be of service in an opposite way."

The publications of the Institution fall under three categories: The Annual Reports made by the Director to Congress; the Miscellaneous Collections, and the Contributions to Knowledge. The first, besides giving a popular *résumé* of the operations of the establishment, its expenditures, condition, &c., contain valuable translations from works not generally accessible to American students, reports of lectures, memoirs, extracts from correspondence, &c. The Miscellaneous Collections are composed of works intended to facilitate the study of natural history, meteorology, &c., and are particularly designed to aid individuals who may be engaged in special studies under any one of these heads. It is the aim of the Institution, by these means, to increase the number as well as to facilitate the labours of persons engaged in those studies as specialists. The volumes known as Contributions to Knowledge consist of memoirs supposed to contain positive additions to science, resting on original research initiated or promoted by the Institution, except in the case of independent works whose publication is assumed by the Director because of their ascertained merit, and

which may be freely offered by their authors in the absence of any other channel for the communication of their labours to the scientific public. In this way the Institution offers itself as a medium for the publication and dissemination of works possessing an inestimable value to scientific students, but which, through being addressed to a "fit audience though few," would otherwise entirely fail of publication, because their unremunerative character, considered in a financial point of view, would leave them a prey to "dumb forgetfulness" if they were compelled to depend on the ordinary resources of publishers engaged in the book trade.

The publications of the past year, as stated in the last Annual Report of Professor Henry, embrace tables and results of the precipitation of rain and snow in the United States, and at some stations in adjacent parts of North America, and in Central and South America. In the words of Professor Henry:—

"This memoir is one of a series embodying the results of all the labours of the Smithsonian Institution in regard to the meteorology of the United States. These will include not only all the observations which have been made under its own direction, but also the discussion of all that has been made by other parties. The whole series will embrace the tabulation and discussion of observations on the temperature, atmospheric pressure, direction and force of the wind, moisture of the air, and miscellaneous phenomena."

Another work, that of Dr. Horatio C. Wood, of Philadelphia, treats of "*Fresh-water Algae*," and forms a complement to the great work of Dr. Harvey on the Marine Algae, as published by the Institution in the year 1858. The memoir embraces all families of the fresh-water Algae except the Diatomaceae, which are so numerous as to constitute in themselves a special object of study.

Another investigation embraced in the last publications of the Institution is a contribution to the science of Tides, by Mr. William Farrel, of the United States Coast Survey.

Believing that most of the hitherto unexplained apparent anomalies in the tides are due to the friction of the water on the surface of the earth, the author has given special attention to the effects of this in all the various cases, not only on the hypothesis of its being in direct proportion to the velocity but also as the square of the velocity.

In forming his tidal theory Mr. Farrel makes comparisons

"with the extended series of observations of the United States Coast Survey, and with the results obtained by the Tidal Committee of the British Association from the analysis of tidal observations of various ports by means of the harmonic method of analysis. The memoir also contains the discussion of the published series of observations of the French Government at Brest, with a comparison of the results with theory, and a chapter on the retardation of the earth's rotation on account of the tides, and its effect upon the apparent secular variation of the moon's motion in its orbit."

Of the great and laborious investigation instituted by Professor Simon Newcombe, of the National Observatory, into the orbit of Uranus, as given by the Smithsonian Institution to the astronomical world, I need not speak more particularly, that work having already received the highest applause which can be bestowed on its learned and distinguished author.

The Smithsonian Institution having collected large numbers of vocabularies of the several Indian languages of North America, these materials have been placed in the hands of Mr. George Gibbs, for critical study, that they may yield their proper contingent to current ethnological and linguistic science.

Professor Theodore Gill, an eminent naturalist connected with the Smithsonian Institution, has prepared three catalogues to facilitate the re-arrangement of the collections of the National

Museum in Washington. One treats of the arrangement of the families of molluscs, referred to in previous reports; another of the arrangement of the families of mammals; and a third of the arrangement of the families of fishes. A large demand has been made for these catalogues for the arrangement of other museums and collections.

The National Academy of Sciences, whose proceedings at its annual meeting, held in this city early in the month of April last, I reported to you at some length, has recently closed its intermediate session at Philadelphia, where interesting papers were read on many scientific subjects. Among these I can only indicate for special remark, without, however, intending any reflection on other memoirs which, for want of space, I must pass over in silence, the papers of Professor Elias Loomis on the "Results derived from an Examination of the United States Weather Maps for 1872 and 1873;" of Professor Alfred H. Mayer on "The Composite Nature of the Electric Discharge;" of Professor Charles A. Schott on "The Secular Change of the Magnetic Declination in the United States and adjacent Countries of North America;" and of Professor Henry on "The Effect of Wind upon Sound-Waves."

The discussion contained in the last-named paper relates to a most interesting question raised with regard to the propagation of sound, where the problem is complicated with considerations derived from the presence of contrary winds as well as of fogs; and Professor Henry controverts some of the recent conclusions reached by Professor Tyndall in his kindred experiments on the waves of sound. Professor Tyndall, in seeking to account for the variable rate of the transmission of sound, and the apparently contradictory effect at times of the wind's action, refers the phenomena to a flocculent condition of the atmosphere produced by the mingling of air and vapour, and by patches of air of different temperature. On this induction Professor Henry spoke as follows:—

"Fog has been shown to have no apparent effect on the penetrating power of sound. A sound has been heard twenty-five miles through a dense fog. Snow storms have no effect. Vapour in the air could not, therefore, produce the phenomena, as Tyndall supposes. The fault with Tyndall's experiments was that they were all made in one direction, and from these partial experiments he derived his theory of the acoustic opacity of the atmosphere. Last summer he (Professor Henry) placed a large steam trumpet on a steamer. The wind was from the west, and the trumpet was pointed northward. The steamer sailed toward the wind and carried the sound only $3\frac{1}{2}$ miles, but in sailing in a contrary direction the sound was heard for a distance of eight miles. If Professor Tyndall had observed the sound from one direction only, he would have called the day opaque; if from the other only, he would have concluded it was quite clear."

The explanation offered by Professor Henry to account for the deflections with which sound is propagated under the action of variations in the direction and intensity of the wind is as follows:—

"In a river of air of considerable depth moving over the surface of the earth, the lower part moves with less velocity on account of friction than the upper part, and consequently the tendency would be to tip the sound-wave so as to throw the sound downward toward the earth in the case of the sound moving in the same direction as the wind, and to deflect it upward in case the movement is in an opposite direction, throwing it into the air above the head of the observer."

This hypothesis gives, he thinks, a ready explanation of all the phenomena observed, and was fully confirmed by a series of experiments which he made last summer, and the details of which are reported to the Academy with Professor Henry's accustomed clearness in the paper above specified.

JAMES C. WELLING.

NOTES AND NEWS.

A New Astronomical Photometer.—Professor Thury describes, in a paper read before the Société de Physique et d'Histoire Naturelle of Geneva, a modified form of the photometer with variable aperture, which he has applied successfully to the determination of the brightness of stars. The principle on which this instrument depends is, that the apparent brightness of a star varies with the aperture of the telescope, and M. Thury's contrivance consists in a diaphragm composed of sixteen rectangular plates of metal arranged radially in a circle, and sliding to and from the centre by a pin moving in a spiral slot cut in each, so that they all approach the centre equally, and form a nearly circular aperture of variable size. In this way the aperture could be reduced till the star (if not too bright) was extinguished, and the aperture of the diaphragm when this occurred would be a measure of the star's brightness. This is the method which has ordinarily been employed in photometry, and is known as the method by extinction. One great objection to it is that the disc of the star increases as the aperture is diminished, the result of the wave of light being limited by the object glass to a small portion of a spherical surface. To get over this difficulty, or rather to keep this variation within moderate limits, M. Thury never reduces the aperture below 28 mm., which, with an object glass of 121 mm. to start with, diminishes the light to one-twentieth. Where smaller apertures would be required, he views the star's image as reflected from a plane surface of glass at an angle of 45° , the brightness of such an image being only one-twentieth of what it is when viewed directly; a second reflection of the same kind reduces the light to one four-hundredth of its original brightness, so that M. Thury is able to measure any star which is not more than eight thousand times as bright as the faintest star visible in his telescope. The brightest stars are, however, out of his range; thus, Sirius requires the aperture to be reduced to 4 mm. to extinguish its light.

Another difficulty is the comparison of stars of different colours; but though such observations do not appear satisfactory to the observer, the results for any one individual are more accordant than might be expected, Fraunhofer and others having found that after a little practice, measures of the relative brightness at different parts of the spectrum might be made with tolerable accuracy, though doubtless different observers would differ greatly in their estimates. The question, however, of the colour of stars can be satisfactorily treated, though not on the principle adopted by M. Thury. As the base of the scale of magnitudes, Professor Thury proposes the faintest star visible to the naked eye, and to eliminate errors of observation he suggests that the mean of a considerable number should be taken, which comes to the same thing as the plan adopted by previous observers of selecting a number of sixth magnitude stars: in his scale each magnitude would be twice as bright as the one below; but though this ratio is proposed on account of its convenience, it is not really so simple as the ratio 2.512 (proposed by Pogson), the logarithm of this number, required for calculating the magnitude, being 0.4, making a first magnitude star exactly 100 times as bright as a sixth, and a second magnitude 100 times as bright as a seventh, and so on; and further agreeing with the relative brightness of first and sixth magnitude stars on the usual scale, as found by Sir W. Herschel. M. Thury does not give any of his observations, but contents himself with discussing the theory of the photometer with variable aperture.

Eclipse of the Sun.—The beginning and end of the eclipse of October 10 were observed by Secchi with the spectroscopic directed to the sun's limb in the ordinary way, so as to see the black moon advancing over the chromosphere, as an experiment

on the applicability of this method to the Transit of Venus, the object in that case being to observe the external contact with the sun's limb, which cannot be done accurately unless the advancing planet can be seen outside the sun on the chromosphere.

The results obtained by Secchi are given in the *Bullettino Meteorologico del Collegio Romano*, the conclusion being that his method of using a prism in front of the spectroscopic, so as to throw a prismatic image of the sun on the slit, is better, as it allows the whole of the sun to be seen, the red light from one part, the yellow from another, the blue from another, and so on, falling on the slit and being afterwards spread out by the spectroscopic, so that the corresponding parts of the sun appear at the red, yellow, and blue parts of the spectrum, and an image is thus formed in which the different points appear of different colours, the chromosphere being seen when the adjustment is such that the limb of the sun is seen at the part of the spectrum corresponding to the red line of hydrogen. In this way the difficulty of placing the slit exactly at the point of contact is avoided, though Secchi's method requires a more powerful instrument and very perfect prisms. But with either method it is necessary, as appears from the observations of this eclipse, that the sky be quite free from light cirrus clouds, which are the worst enemies of the spectroscopist.

If the telegram from Japan is to be trusted, it seems that Venus has been seen passing over the sun's *corona*, outside the limb, presumably without the use of any spectroscopic; but further explanation of this is required.

The Tail of Coggia's Comet.—Mr. Cleveland Abbe, of Washington, has communicated to the *Astronomische Nachrichten* a series of careful eye observations of the tail of Coggia's comet, extending from June 18 to July 22, the positions and breadths of sections at different distances from the head being given, as well as the length. These positions and the careful notes which accompany them will give the means of deciding several interesting questions—such as, whether the tail pointed directly away from the sun; how much it was curved; and whether this curvature changed—matters which have a very important bearing on the question of the physical nature of comets.

Spectra of Stars.—From his examination of the spectra of stars, Professor d'Arrest has come to the conclusion that colour cannot be taken as a certain indication of the nature of the spectrum, and that the connexion between colour and temperature, though not improbable, has not been satisfactorily established; while the assertion that the red stars are older than the yellow, and the yellow than the white, is, according to M. d'Arrest, entirely without foundation. The spectroscopic examination of stars which M. d'Arrest has made at Copenhagen has resulted in increasing the number of stars of Secchi's third type threefold. These stars are distinguished by channelled spectra, indicating that their temperature is so low that combination of the elements in their atmospheres has taken place. M. d'Arrest's observations are given in the *Astronomische Nachrichten*, Nos. 2,009 and 2,015.

Solar Photography.—Dr. Lohse calls attention to a very simple method of obtaining photographs of the sun without the use of an instantaneous slide or photographic chemicals. In the ordinary method an exposure of a few thousandths of a second is given, and the latent image developed afterwards; but if the exposure be a thousand times as long, i.e., a few seconds, an image will be obtained without development, as was done in the earliest photographic processes, though in the case of the sun a comparatively long exposure is rather an advantage than otherwise. Dr. Lohse uses the ordinary paper for photographic printing, sensi-

tised with chloride of silver, which he has found by the experience of several years to give very good results.

Photographing the Red Rays.—Dr. H. C. Vogel has extended his researches on the effect of adding colouring matter to ordinary collodion for photography. Some time ago he found that the presence of a substance such as corallin, which absorbs red rays of a certain refrangibility, rendered the bromide of silver sensitive to those rays, a discovery which seems likely to be of the greatest importance in photography, the great defect in photographs being that red and yellow come out black. Dr. H. C. Vogel now finds that the sensitiveness to the red rays decreases as the quantity of corallin is increased, which he supposes to result from the absorption of a thick layer of the colouring matter being so great that the red light does not reach the particles in contact with the bromide of silver, while with a thin film these particles take up the red vibrations and communicate them to the bromide of silver, causing a partial decomposition of the latter, which forms the latent image to be afterwards rendered visible by the further decomposition produced by the developer.

With this sensitiveness to red rays there is a marked decrease of sensitiveness to the green and blue rays, so that the chemical action is more nearly equalised for the different parts of the spectrum.

Greenwich Observations.—The Greenwich Volume of Observations made in 1872 has just been published. It is generally similar to its predecessors, the only special feature being some lithographed tracings of the photographic registers of magnetic elements and earth-currents of electricity on February 4, 1872—a day remarkable for a magnificent display of aurora and for great disturbance of the magnetic needle, accompanied by earth-currents of electricity which interrupted telegraphic operations all over the kingdom.

Transit of Venus.—A telegram received from M. Struve this week announces that the Transit of Venus has been successfully observed at the very important station of Nertschinsk, in Siberia, with the heliometer and 4-inch telescope; and also at Teheran and Kiakhia, where a photoheliograph and a 4-inch telescope were erected; and, further, that the photographs taken at Port Possiet have proved satisfactory when developed—an operation which, with the dry plate process adopted, may be performed at any convenient time after the exposure.

Observations of the Satellites of Uranus and Neptune.—The great refractor of the Washington Observatory, of 26 inches aperture, has been used by Professor Newcomb and other observers to determine the positions of the satellites of Uranus and Neptune, which are too faint to be seen in any but the very largest telescopes. Sir W. Herschel with his great 40-foot reflector repeatedly observed the two outer satellites, but though he is believed to have seen the two inner, it was only once or twice under exceptionally favourable circumstances, and he did not recognise their existence as satellites, so that the credit of discovering these two was left to Mr. Lassell with his reflector of 4 feet aperture in the pure sky of Malta. The excellence of the Washington telescope is shown by the fact that the two outer satellites of Uranus are visible when the central part of the object-glass is cut off by a central screen of 20 inches diameter, leaving a ring only 3 inches wide.

Phenomena seen during Eclipses of the Sun.—In the eclipse of October 10, Mr. Brett, who observed at Guernsey with a three-inch refractor, noticed a ray of light from the cusp of the sun just at the instant that a deep notch or valley on the moon's limb came to the cusp, a phenomenon which he had seen previously in the eclipse of December 22, 1870. He considers that this may arise from reflection from the moon's surface, the light having

been first bent down very slightly by the refraction of the very rare lunar atmosphere, which would be sensibly confined to the deepest valleys.

A New Observatory in South America.—M. Gonzalez, the Director of the National Observatory of Columbia, is about to establish a private observatory for astronomical physics at Bogota, at an altitude of 10,000 feet, and nearly on the equator, a most favourable situation for the application of the spectroscopy to the sun and planets, as they may there be observed in the zenith, while the observatory will be removed above the grosser portion of the atmosphere.

M. HALÉVY's paper "On the Pseudo-Turanians of Mesopotamia" will probably mark the beginning of an important controversy. The paper was read before the Académie des Inscriptions et Belles-Lettres, and if we may judge from abstracts published in the French journals, it is a decided challenge addressed to the small but valiant army of Cuneiform scholars. M. Halévy denies *in toto* the existence of an Accadian language unconnected with the Semitic dialects of Assyria and Babylon. He protests against the use of any Turanian dialect as a key to the decipherment of Assyrian inscriptions; he denies, in fact, any scientific value to a number of works published during the last ten years by some of our most distinguished Assyriologists. His paper is divided into three parts. In the first M. Halévy examines the linguistic resemblances which have been supposed to exist between the so-called Accadian language and some of the Ugro-Finnish dialects, and he shows that the phonetic system of the Accadian inscriptions differs completely from that of the Ural-Altaic family, that the grammar and the vocabulary of the Turanians are diametrically opposed to all we know of the language of the people of Accad. In the second part M. Halévy tries to find out whether there are any traces in Mesopotamia of the former existence of a non-Semitic race, conquered by invaders who afterwards founded the Second Babylonian Empire. He sums up by saying that the oldest works of art discovered in Chaldaea bear the impress of a purely Semitic genius; that the geographical names of Mesopotamia show no traces whatever of a non-Semitic race; and that the traditions preserved by sacred and profane writers, and by the cuneiform documents themselves, are opposed to any theory that would ascribe the foundation of the first Babylonian Empire to any race but that of the Assyro-Babylonians. In the third part M. Halévy examines the characters of the Accadian idiom, and tries to show that the texts are purely figurative. His arguments are as follows:—

1. The principle followed in Accadian of reinforcing an action by the repetition of a radical, is entirely in accordance with the spirit of the Semitic languages.
2. In Accadian one sign is frequently replaced by another, possessing an analogous ideographic power, and differing only in its phonetic form.
3. This takes place particularly with regard to the termination of the plural of nouns.
4. The only numeral in Accadian of which the pronunciation is certain, viz. *me*, hundred, is clearly Semitic.
5. The pronouns in Accadian have a clearly figurative character. Thus, the demonstrative pronoun *bi* does not change in the plural, because the monogram by which it is expressed conveys the collective idea of double. The personal pronouns have each different types, representing respectful or humble epithets, which take the place of the real pronouns of the spoken language. The reflexive pronoun is *im* (glory), copied from the Assyrian. The relative pronoun *sa* (for things) is written as in Assyrian, and Accadian scholars are wrong in pronouncing it *gar*, in order to remove the affinity, which is palpable.
6. The little that is known of the Accadian verb shows that it follows the modifications of the

Assyrian verb. It has the same number of tenses and voices; it has real verbal voices like those of the Semitic languages; nay, certain ambiguities in Assyrian are slavishly reproduced by corresponding expressions in Accadian. If on some points the Accadian verb seems to follow its own way, this is due to difficulties arising from the incorporation of suffixes used in the spoken languages which the scribes could not pass over in the figurative writing. Besides, that writing assumed very soon a sacred character, and was cultivated with great care, even independently of the spoken language. The Babylonian priests considered the figurative system as the language of the gods and spirits. This explains the law of euphony, which determines the grouping of the signs of pronouns and prepositions in accordance with the termination of the preceding word.

7. The Accadian employs many prepositions copied from Assyrian.

8. The Accadian employs the Assyrian copula *ua*. The adverb is formed by means of a preposition signifying *within*, or by the addition of the suffix of the 3rd person, again as in Assyrian.

9. With regard to the vocabulary, M. Halévy shows that in the so-called Accadian texts every Assyrian expression has one or more equivalents, not only for ordinary conceptions, but also for the proper names of gods, men, countries, towns, mountains, and rivers. There are numerous examples with regard to proper names, and the explanation which M. Halévy offers is that they are not different names, but only different signs intended for the same name.

M. Halévy sums up against the theory which ascribes the invention of the cuneiform alphabet to the Turanians, and treats the admission of a Turanian foundation for the civilisation of the Assyro-Babylonians as a gratuitous hypothesis, fraught with serious danger to the progress of all historical and philological studies.

We have no doubt that such a challenge will not long remain unanswered.

MEETINGS OF SOCIETIES.

PHILOLOGICAL SOCIETY.—(Friday, Dec. 4.)

REV. DR. R. MORRIS, President, in the Chair. A paper by Mr. J. F. Stanford was read, on "Anglicised Foreign Words and Phrases" from the time of Chaucer to the present day. The paper was accompanied by a list of 300 foreign words and phrases in illustration of the writer's object. It would appear that we have enriched our language with words taken from *nineteen* different languages, including Chinese. The writer of the paper has finished his articles on about 6,000 foreign words and phrases, and expects to complete his work with about 13,000 more.

PHYSICAL SOCIETY.—(Saturday, Dec. 5.)

DR. J. H. GLADSTONE, F.R.S., President, in the Chair. Mr. T. Hearson, of the Royal Naval College, described and exhibited the *Strophometer*, an instrument for measuring and indicating speed of rotation. The indications depend on the changes of form of a parallelogram, formed by four equal double links, which revolves about one of its diagonals. The centrifugal force due to rotation tends to make the angles of the parallelogram which do not lie in the axis of rotation move away from the axis and from each other, and thus shorten the distance between the other two angles, which are pressed apart by a spiral spring. Thus, as the velocity of rotation varies, the ratio of the forces acting along the two diagonals varies, and so the shape of the parallelogram changes. One of the angles which lie in the axis of rotation is fixed to the revolving spindle, while the other is capable of motion along the spindle, and the movements of this are communicated to a pointer which indicates on a graduated circle. The essen-

tial novelty of the instrument consists in the means by which it is made to show the average speed for some moderate number of revolutions, instead of the speed at each instant, which, even in a machine that is running steadily on the whole, is often liable to considerable and rapid variations. This is effected, partly by putting a heavy fly-wheel on the axle of the jointed parallelogram, and partly by using a specially contrived friction-gearing to give motion to this axle, whereby changes of velocity in the machine are only gradually communicated to the strophometer. Mr. Hearson finds that the length of the diameter about which the parallelogram rotates is connected with the speed in a manner expressed by the formula

$$n^2 = \frac{kx}{l-x}$$

where n is the number of revolutions per minute, l the extreme length of the axis of rotation supposing the sides all to become parallel, x the difference between the actual length and the extreme length, and k a constant factor. In accordance with this formula, the speed is nearly proportional to the value of x , except when this is very small or very great.—Professor G. C. Foster exhibited an arrangement for making visible to a class the magnitude of any small motion, such as that produced by the expansion of solid bodies by heat. A piece of glass, with a short scale of millimetres engraved upon it, is attached to the body whose motion is to be measured, so that the length of the scale is parallel to the direction of motion. If a powerful beam of light is allowed to traverse the glass, a magnified image of the scale can be thrown on a screen by means of a lens, and the amount of motion is then indicated in millimetres by the number of divisions that pass a fixed mark on the screen, the fractions of one division being estimated by eye. In order, however, to make the estimation of fractions of a division more accurate, a scale of equal parts is drawn upon the screen, and the distance and magnifying power are so adjusted that the fixed scale drawn on the screen serves as a vernier for reading the moveable scale formed by the optical image of the graduation on the glass. The application of the method was illustrated by using it for determining the coefficients of linear expansion of iron and brass. For convenience, the metals were employed in the form of tubes, which were heated or cooled by allowing a current of steam or of cold water to flow through them, it being assumed that in this way the temperature became sufficiently uniform for the purpose of a lecture demonstration. Measurements made during the meeting gave results which were fair approximations to the values given in the books for the expansion of the metals used.

ROYAL ASTRONOMICAL SOCIETY (Friday, Dec. 11).

PROFESSOR ADAMS, the President, in a few appropriate words, expressed the regret with which the Council had heard of the death of their Assistant Secretary, Mr. John Williams, who had held that office for twenty-eight years. Sir George Airy read to the meeting the telegrams which had been received from the various Transit of Venus expeditions, the substance of which was given in the ACADEMY last week. He afterwards read part of a paper (not yet completed) on the treatment of the different classes of observations of the Transit of Venus, the chief point being that the system must be such that every observation should contribute its proper quota to the result, a large number of equations involving symbolical corrections to the position of Venus and to the assumed value of the Sun's parallax being formed, one from each observation or measure of a photograph, and the values of those corrections which best satisfy all the observations, obtained by the method of least squares.

Mr. Berthon described an "equestrian equatorial," so called from the circumstance of the telescope

riding above the declination axis. This instrument had been made under his supervision for Mr. Evans, of Wimbleton, and though making no pretensions to great accuracy, the mounting was stated to be remarkably steady and well adapted to a Newtonian reflector of 12 inches aperture, the size adopted in Mr. Evans's equatorial, which was exhibited to the meeting. Mr. Knobel then described a simple contrivance for varying the aperture of a telescope so as to determine photometrically the magnitudes of stars on the well-known plan of reducing the aperture till the star is extinguished. Mr. Knobel adopts the form of an equilateral triangle for the aperture, but this, though convenient mechanically, is open to the grave objection that instead of the disk and concentric rings formed by diffraction at a circular aperture, a six-rayed star is the result of a triangular opening.

Mr. Dunkin read a paper in which he gave the results of a comparison of the transit observations of the sun's first and second limbs made by the different Greenwich observers, from which it appeared that there was great personality in this respect, so that the time of passage of the centre deduced from those of the two limbs was affected to the extent of 0.12, when the results obtained by the two extreme observers were compared, one of these observers systematically making the errors of the tables 0.12 (equivalent to 2") greater than the other. This agreed with what Mr. Dunkin had found previously in the case of the moon, and there was no doubt that such a personality would introduce a considerable error into the determination of longitudes by the method of moon culminations; an error of 2" in the position of the moon's centre producing an error of 4' in the resulting longitude. Mr. Dunkin further stated, in reply to a remark by Professor Adams, that the Astronomer Royal was so impressed with the importance of this matter in its bearing on the longitudes of the Transit of Venus stations, that he was having a transit instrument erected for the determination of this personality in the case of the Transit of Venus observers.

LONDON ANTHROPOLOGICAL SOCIETY (Friday, Dec. 11).

DR. CHARNOCK, F.S.A., President, in the Chair. The papers read were: 1. "On the Hunebedden or Cromlechs of Drenthe, Holland," by Dr. Lubach. The Hunebedden, which resemble some of the ancient stone erections in Bretagne, contain stone weapons, urns, and burnt bones, which are supposed to belong to a pre-Germanic race. The author also described certain tumuli containing metal weapons, urns, &c. 2. "The Scaphoid Skull of a Pole," by Dr. Isidor Kopenicki. 3. "Crania of the Round Barrows of a Section of the Yorkshire Wolds," by J. R. Mortimer, Esq. 4. "On certain Difficulties in Ancient Theologies and Modern Science," by Dr. Inman.

ROYAL GEOGRAPHICAL SOCIETY (Monday, December 14).

THE paper read at the usual fortnightly meeting of the above society on Monday evening was by Lieutenant Grandy, on his recent exploration from the west coast of Africa. Before the commencement of the paper, Sir Henry Rawlinson, who was in the chair, related the recent intelligence which had been received from Lieutenant Cameron respecting his journey along the west coast and southern end of Lake Tanganyika. During his cruise Lieutenant Cameron had been fortunate enough to solve the mystery which had puzzled physical geographers for so long, i.e., how the waters of a lake without an outlet could remain sweet. It appears now that the lake has an outlet called Lukuga, about five miles south of the islands explored by Speke. Livingstone had passed it in the night, on his northward journey, and had not proceeded far enough to touch it on his return journey. The current was only from one to two knots per hour.

Lieutenant Cameron had followed the course for four or five miles, but further progress had been stopped by floating grass and large rushes; he had hoped to get boats of light draught, and through a friendly chief to conduct a successful exploration; but in this hope he was disappointed, through the difficulties of navigation, which required a large number of natives to cut away the grass, and of procuring stores. The outlet led, he believed, into the Lualaba, and to identify this river with the Congo was, in Lieutenant Cameron's opinion, a much more important task to accomplish. He had questioned many Arabs as to whether the Lualaba flowed into the Albert Nyanza, but they all said it joined the Agarawa, while one declared he had travelled along it for fifty-five days from Nyangwe, and had eventually reached the sea, where the white men had ships and factories. He said the river was as broad as Tanganyika and had numerous inhabited islands. Cameron, in conclusion, proposed to write from Nyangwe and thence strike for the sea. After some remarks from the President, Mr. Markham proceeded to read the account of Lieutenant Grandy's expedition to relieve Livingstone, which had been generously organised by Mr. Young, of Kelly, at a cost of 3,000*l*. Lieutenant Grandy left Ambriz for Bembe, the advanced post of the Portuguese on the road leading into the interior. At Bembe he visited some caves and copper mines of interest in the neighbourhood. Preparations are being made by the Portuguese for abandoning Bembe, a measure which the Lieutenant thinks a great misfortune, as at present the country is kept open by their presence there. After collecting carriers he started for the south bank of the Congo on April 8. He was well received by the King of Congo, but found much difficulty in obtaining carriers, an outbreak of small-pox having carried off a large number. During his stay in Congo he ascertained that the oil-palm grew abundantly, but that it is principally used for the distillation of an intoxicating liquor. The king, however, was struck with samples of stearine shown to him, and promised to encourage the growth of the palm to that end. The india-rubber tree also grows plentifully, but its commercial utility is unknown. After numerous obstacles Grandy managed to reach Tungive on July 17, but here further progress was stopped by the King of Makuta, who would allow no passage through his dominions. While the Lieutenant was preparing to adopt a circuitous route round Makuta's territory, the news of Livingstone's death arrived, and together with it the recall of the expedition.

Lieutenant Grandy explained his views with regard to the head waters of the Congo, which are that they consist of two branches, one of them draining Angola to the south, and the other to the north, being probably connected with the Lualaba. To penetrate the country he considers impossible, except with an armed force strong enough to overcome all opposition.

The proceedings terminated with the usual vote of thanks.

LINNEAN SOCIETY (Thursday, Dec. 17).

DR. G. J. ALLMAN, President, in the Chair. Sir John Lubbock read a paper "On Bees, Ants, and Wasps," being a continuation of observations read before the Linnean Society last year, for the purpose of testing the power of communication possessed by these insects. When bees were placed on honey, if the honey was out of sight and in a place not frequented by bees, few, if any, others came to it; although those bees which had possession of the honey began to work in the morning before the rest, and continued to do so even in weather which drove all the rest into the shelter of the hive. With reference to the affection which bees are said to entertain for one another, the author states that though he had repeatedly seen them lick a bee which had smeared herself with honey, he never observed them to show the

slightest attention to any of their comrades which had been drowned in water. So far from manifesting any mutual affection, they appear to be thoroughly callous and utterly indifferent to one another. Their devotion to their queens is generally quoted as a most characteristic trait, but appears to be of the most limited character. A queen-bee placed in a box containing some comb along with a number of workers was entirely deserted by them; and when placed close to a number of working bees which were passing through a window, they took not the slightest notice of her; though when afterwards put in the hive she immediately attracted a number of bees. With regard to the partiality of bees for certain colours, Sir John found, as the result of a number of experiments, that they were invariably attracted by honey placed on blue in preference to orange paper. On one occasion when the papers had been transposed, a bee returned to the place where the blue paper had previously been, but, observing the change of colour, without a moment's hesitation dashed off to the blue. He then proceeded to recount some experiments on the sense of smell possessed by bees, on their power of recognising their own companions, and on the different occupations of different bees, mentioning observations which seem to show that the bees act as nurses during the first few weeks of their life, and only subsequently take to collecting honey and pollen. He then mentioned some experiments on wasps, which show that they possess the power of distinguishing colour. In conclusion, he recorded a number of experiments on ants, which seemed to show that, whatever may be the case with bees, ants do possess the power of communicating detailed facts to one another. It is remarkable, however, how much individual ants appear to differ from one another in character.

The President then read "A Diagnosis of New Hydroids."

FINE ART.

Masterpieces of the Pitti Palace. Photographed from the Original Paintings by Alinari of Florence. (London: Sampson Low & Co., 1874.)

THE publishers of this book have done good service in the cause of art. The volume before us contains photographs of twenty of the best-known pictures of the Pitti and Uffizj Galleries, taken directly from the original paintings, and presented to us in all their integrity. By this means the terrible blemishes which three or four hundred years have wrought are of course rendered visible, but unless the painting be in a very bad state, a faithful reproduction of it is generally far more satisfactory than a photograph from an engraving. In the present volume Perugino's *Assumption* comes out clearest; the rapturous expressions of the Madonna and of the Saints on earth are admirably reproduced, and the whole tone of the picture, except where the light blues are rendered by nearly pure whites, is wonderfully preserved. Fra Filippo Lippi's *Coronation of the Virgin* comes out fairly. There are upwards of sixty figures in this work—mostly portraits of Florentines in their holiday garments, and the face of each is distinctly given. Among them is the portrait of the Frate himself, holding a scroll bearing the inscription "Is perfect opus." Botticelli's *Holy Family* gives well the expression of the Virgin and the Holy Child and some of the attendant angels, but it is evident that this picture does not hang in a good light for the photographer. The *Madonna in Adoration*, by

Lorenzo di Credi, is painted in colours too dark for adequate reproduction, though even here the faces are given with much detail.

But the page which everyone will regard with the most enthusiasm contains Raphael's *Madonna della Sedia*. We suppose that no painting in the world has been copied and reproduced more often than this. Garavaglia's charming engraving is known to everyone, but if we seek for a faithful transcript of the great painter's work, we can hardly hope for anything better than this photograph of Alinari's. The crack in the panel, the contractions of the varnish, the spots and blemishes, are, alas! plainly to be seen; but even in the photograph we fail to notice these as we gaze on the majestic beauty of the Virgin and the unspeakable grace of the Child.

Contrasting with the *Madonna della Sedia* of the Roman period, we have an admirable photograph of the simple and lovely *Madonna del Gran Duca* of the Florentine period, and another of the more elaborate *Baldacchino Madonna*. The other pictures of the collection are: Titian's *Flora*, Fra Bartolommeo's *Resurrection*, Andrea del Sarto's *Madonna in Glory*, Guido's *Sybil* and *Cleopatra*, both admirably reproduced; *St. John*, by Carlo Dolci, a *Holy Family* by Bronzino, and a *Madonna* by Murillo.

It is perhaps only fair to state that this charming collection will probably only commend itself to connoisseurs and students of art. Admirers of smooth steel engravings and worked-up photographs will scarcely appreciate its merits. MARY M. HEATON.

ILLUSTRATED CHRISTMAS BOOKS.

VERY few of our readers, we fear, remember the times of the "Annuals." Then it was nearly everyone bought and presented to their friends or family one or other of many lovely little books, 12mo size for the most part, and those who had no friends or families bought the *Genus*, *Keepsakes*, or *Landscape Annuals* for themselves. In them were to be found the latest new poems, by all but the few greatest living poets who lived out of the sphere of current literature; and the prose was the most varied *mélange* of light and shady literature—from Thomas Miller, but lately deceased, without having attained his reward; or Mrs. S. C. Hall, who is still writing as excellently as then, to the Rev. Edward Irving or Lord Normanby. And the illustrations were all as novel as the literature, and showed what the majority of the leading painters had been doing in the way of invention during the year, and where the landscape men had been sketching: and all these prints were engraved in the most lovely way by a school of miniature engravers now utterly vanished and gone.

What a different sight is the editor's table at the "festive season" to-day. The majority of the volumes to be now considered as the successors of the *Annuals* are much more ambitious in size, of a splendour demoralising to the sense, not at all like the watered silk or stamped leather of the former time, and for the most part they are books professing great things, dealing with the most important subjects in the history of art, but in nine cases out of ten they have been merely made to suit the illustrations, which have been intimate acquaintances from time immemorial. Such is a large class, but there are various classes. What does the reader think of a book of extracts, called *From Dawn to Sunrise: or, Gleams from the Poets of Twelve Centuries*, which is, nevertheless, a treasure house of pretty woodcuts to popularise the *Gleams*? Or the vaguely ecstatic title of *Beautiful Pictures*, which one would say is devised for the exclusive attraction of the outsiders, whose apprehension of a picture is only to be qualified by the three degrees of comparison as to its attractions in the way of "beauty." But there is a third order on our table, and that is, such works as have a subject of their own of something like original and permanent interest, earning their right to be classed with the others only by the luxurious style of printing, illustration, and binding.

One of the very best of these, a book that proves itself at once to be the result of loving study and complete acquaintance with the subject, and so deserving a very large share of success, is *Life on the Upper Thames*, by H. R. Robertson, published by Virtue, Spalding, and Co. This has been, no doubt, partly printed before in the *Art Journal*, and the pictures in it partly seen there also, one of them, representing a girl steering a barge called *The Pride of the Thames*, has been made public enough by posters nearly as large as life; but this only proves its popularity, and both literature and art show us the work of a living man of cultivation in the full enjoyment of the scenes he describes, infinitely more interesting than thousand times repeated Rembrandts and Raphael's Madonnas, with information about them threadbare before one was born. The next book we take up is another edition, elaborately decorated, of Keble's *Christian Year*, published by Cassell, Petter, and Galpin. This cycle of lyrical compositions, although of really moderate intrinsic value, has become so associated with the Church of England services, and so general a favourite, that any number of new editions succeed. The present is profusely adorned both with picture illustrations and ornamental borders; the majority of these, we think, American in origin. The taste in design of this kind, borders and purely decorative headings and tail-pieces, on the other side of the Atlantic, is really the most absurd muddle of intricacy ever yet seen in the world. To call it bizarre or florid, to apply to it, indeed, any word that might be applied to a work of art, is out of the question.

The American artist at this moment does not know one style or ornament from another, but yet he designs. Nevertheless, we fancy this edition may very exactly meet the aesthetic requirements of a very large class. *Military and Religious Life in the Middle Ages and at the Renaissance*, by Paul Lacroix, has been just issued by Chapman and Hall, and may, by externals, be treated as a Christmas book. It is as excellently and profusely illustrated as were the previous volumes on "Arts" and on the civil life "Manners and Customs," with about 400 woodcuts and seventeen very perfect chromolithographs. Unhappily, the section "Religious Life" gives M. Lacroix an opportunity for exhibiting his extreme partisan attachment to anything papal, and the anonymous translator seconds him apparently. Thus, he introduces a chapter on the Inquisition rather unnecessarily, in which he eulogises that blessed institution for having kept Spain pure, without seeing that it kept Spain back till that country is now but half civilised. This chapter is mainly illustrated by cuts exhibiting the cruelties practised by Huguenots and other reformers on Catholics in France and the Low Countries!

Coming to the artistic works that now form the regular corps of gift-books, we find Messrs. Virtue, Spalding, and Co. in great force, as well as Messrs. Chatto and Windus. *Pictures by Etty, with Descriptions and a Biographical Sketch*, by W. Cosmo Monkhouse, and *Pictures by Italian Masters, Greater and Lesser*, with an essay on the division of Italian art into schools which may be really of use to the student, and *Notices of the Painters*, by William B. Scott (the present writer), are contributed by the first firm. Mr. Monkhouse has done his work in an admirable and genial spirit, and the biography of Etty turns out a work of art itself in a way. It does not, however, quite answer to the idea of the slovenly, fat, little morose

man some of us still remember. The engravings give us some of his good things, "Youth and Pleasure" being the frontispiece. It is amusing to find Mr. Monkhouse renaming some of these: that called by the painter himself—whose "book-learning" and notions of the poetic were nearly as uncritical as those of Turner himself—"Venus and her Youthful Satellites arriving at the Isle of Paphos," is now "The Coral Finders;" and the other, "Cupid sheltering his Darling from the approaching Storm," is now, "Cupid and Psyche." Etty's "Satellites" of Venus—and of course he used the phrase in a perfectly frank manner—are like portraits of young ladies with the coiffure of that day, painted by Inskipp or Chalon, only without the millinery.

The Italian Masters, Greater and Lesser, contains excellent engravings from some of the best Venetian and other masters, and also from a number of the artists of the seventeenth century, Guido, Guerino, Carlo Dolci, and others. The author, in writing of these men, whose biographies have been very little treated of in English books, has taken advantage of the labours of the German writers Adolf Stern and Andreas Oppermann, in their *Leben der Maler, für Künstler und Kunstfreunde bearbeitet*, so that the English reader may find some new information with regard to the lives of some of the later Italian leaders in art. *Beautiful Pictures* is a series of exceedingly good engravings from the best works of our living English painters, Noel Paton, Marks, Faed, &c. These have been seen before in the *Art Journal*, but the impressions here given are still as perfect as proofs; each plate has a couple of pages of description by Mr. Sydney Armitage. *The National Gallery*, a selection from its pictures, engraved by Doo, Burnet, Finden, Pye, &c., with descriptive letterpress, issued by the same publishers, is a large and splendid volume, but the plates are in a very different state from the last. They are, in fact, the copper-plates done many years ago by the associated engravers, now very much the worse for wear. *Flemish and French Pictures, with Notes concerning the Painters and their Works*, by F. G. Stephens (Sampson Low and Co.), is the modest title of an exceptionally admirable book of its class. This is a series of twenty of the most perfect etchings ever produced—at least half of them may be so described, the others being rather of the makeweight character. They have appeared before in Paris, but are still perfect, we should like to know how. They must be etchings on steel. Those by Rajon and Flameng are certainly charming. The practised hand of Mr. Stephens has written to these a more than usually elaborate sketch, not of the artists represented or the works given, but of the schools of painting in Holland, Flanders, and France. He has gone over again this oft-trodden fruitless subject, and has added an index at the end as if it were a book of reference. Finding the name of Jacob Walch here, and having been lately spending some time in an attempt to learn something of this painter and engraver, called the "Master of the Caduceus," who lived in Venice, and afterwards in the service of Lady Marguerite in Antwerp, we turned up the page referred to, and found this luminous account of him: "Jacob Walch, an esteemed portrait-painter of Nürnberg." WILLIAM B. SCOTT.

TWO RESTORED REYNOLDSSES.

ONE of the pocket-books of Sir Joshua Reynolds, so valuable to his biographers, contains the entry, "1785, Sep. 13. Duke de Charter, 2621." This sentence, slightly shaky in its foreign spelling, records the production of one of the finest portraits of the artist. The Duc de Chartres, subsequently Duc d'Orléans, and better known as Philippe Egalité, was at that time on a visit to the Prince of Wales, for whom the picture would seem to have been painted. Leslie mentions the fact of the Duke having sat beneath it at the Royal Academy dinner in 1786, and in another page re-

fers to it as being seen by him in 1803, fresh and brilliant as when it left the painter's easel, with a concluding note that it was destroyed by fire at Carlton House. It was of life size, and represented the Duke in scarlet hussar uniform with tight boots (such, one may fancy, as he objected to pull off upon the scaffold), with an attendant in the background holding his charger, partly concealed behind a bank.

The picture was destined to undergo strange misadventures. It hung for some years in the west ante-room of Carlton House, with the portraits of two Dukes of Cumberland, the portly victor at Culloden, and Henry Frederick, brother of George III., both habited in the robes of the Garter. The portrait of the Duc d'Orléans was, however, for many years not allowed to be visible, having been removed from its place of honour. Nor is this wonderful. When the Duke, as Philippe Egalité, commenced that career of wild opposition to the Royal Family, which after culminating in his vote for the death of his sovereign conducted him to the well-deserved guillotine, his portrait could not be a welcome object to the eyes of a neighbouring prince. As above mentioned, it was again in its former position in 1803; is engraved in Pye's *Royal Residences*, as in the same place in 1817, and probably remained there till 1824, when a serious fire broke out in the room where it hung. The fire, which arose by the brown holland bag of the central chandelier becoming ignited, was happily confined to the room where it originated, but not before the flames had done serious mischief to the paintings, which were, indeed, supposed to have been entirely destroyed.

Such, however, was not the case. Some years ago Mr. Redgrave, R.A., the careful surveyor of the pictures in all the Royal collections, observed among what may be called some lumber at Hampton Court two large fragmentary canvases, which though frightfully charred were clearly recognisable as the remains of the Philippe Egalité portrait, and that of the younger Duke of Cumberland. The picture of the elder Duke, known as the "Butcher," has not been found, and was probably too utterly consumed to be worth preserving. Finding that the effect of the flames, serious as they undoubtedly were, was confined mainly to the varnish, and that the canvas still exhibited ample means for judging of the scale of colour and general character of the work, it was resolved that an effort should be made to retain a memorial of two important works by our great portrait-painter. The pictures were entrusted to the care of Mr. C. Buttery and, under the able supervision of Mr. Redgrave, have been thoroughly restored, and put into a state which, though it makes no pretension to be considered an actual resurrection of the lost treasures, is truly marvellous as affording to the present generation a reminiscence of works they had long ceased to regard as in the category of existing things.

Mindful of the attacks to be expected from critics, who "contund and vilipend" (as a good old Cambridge professor used to say) all matters in which they themselves have had no part, Mr. Redgrave has taken care to have photographs taken of the condition of the two paintings when first discovered. The dreadful appearance of the entire surfaces, split as they were into hundreds of minute fragments, and parts even of the canvases destroyed, forms a sufficient guarantee against any intent of offering these paintings as "real Reynoldses," and leaves us only to wonder at the hopeful mind which could conceive, and the patient skill which could carry out so seemingly impracticable a task as that which has been here achieved. The pictures are now, we believe, at Hampton Court, and will doubtless ere long be exhibited to the public gaze.

It should be noted that great aid was available for an accurate revival of the original portrait of the Duc d'Orléans in the mezzotint engraving by

J. R. Smith, as likewise by copies on a reduced scale, of which three at least exist; one by Drummond, now at Petworth, another by Briggs in the collection of the late Mr. Jacob Bell, and a third by Camille Roqueplan in the collection of Sir Richard Wallace, now exhibited at Bethna Green Museum. C. C. BLACK.

THE "SPINA" CHURCH, PISA.

SOME time ago report attributed to the authorities of Pisa a proceeding which naturally excited surprise and displeasure in many—no other than the demolition of one of the fairest adornments of their ancient city, and one of the finest examples of mediæval architecture in Italy—the small church, or rather chapel, originally built for the devotions of mariners, which rises in gem-like beauty above the Arno between the southern bank of that river and the public walk on the same side, well-known as the "Lung' Arno" of Pisa. This edifice, originally called Santa Maria del Ponte, was founded A.D. 1230, and conformably to a decree of the Pisan magistrates was enlarged, completed, perhaps entirely rebuilt in 1323, to which period (or to what may be regarded as the second building) its luxuriant architectural ornaments and statuary no doubt belong. Considered at the time of its completion, as we are informed, a veritable miracle of art, it is well described by G. Knight as an "architectural gem," being built entirely of white marble with broad horizontal bands of black, in the usual Tuscan style; the general characteristics those of the Italian Gothic in its most elaborately wrought and profusely ornate development. Numerous statuettes, standing in tabernacles under graceful canopies, with crocketed pinnacles and acute arches, adorn the exterior; those on the façade, a Madonna and Child with two angels (or adoring saints) in the centre, and five saints along the sky-line, being the works of Giovanni Pisano. Having obtained information on the spot, I am able to refute erroneous reports, and rejoice to state that no demolition has been either proposed for, or carried out in, this beautiful building.

The project actually sanctioned is similar to what has been adopted in recent years with respect to several other Italian churches where the hand of time has weighed heavily on the features and marred the beauties of mediæval construction—as, in the most remarkable instance, at St. Mark's, Venice. The Pisan church in question has been called Sta. Maria della Spina since 1333, in which year its most precious relic, a reputed thorn from the Saviour's crown, was placed here by the descendants of a merchant who had brought it from Palestine during the Crusades. The restorations now in progress here are accomplished by the same method as in other instances—i. e., by taking down and again building up the ancient materials, replacing every piece of marble, every detail of sculptured adornment, statuary and relief work, without any substitution of the new for the old save where decay or irreparable injury has rendered such renewal indispensable. In this case, indeed, a more than usually difficult task has been deemed necessary. The works here, ordered about three years ago, and commenced soon afterwards, will effect not only such repair as is requisite, but the elevation to a higher level and the translocation of the entire edifice to a short distance from its original standing. The Church of the Sacred Thorn will henceforth stand on a socle higher by 1 metre 60 centimètres than formerly, and will occupy an area nearer by 80 centimètres to the river-bank, thus leaving more space for transit on the narrower of the two "Lung' Arno" quays, with more security against the often disastrous inundations of that river. In the actually attained stages of the restoration the edifice now rises with its façade 80 centimètres in advance of its original line; all the valuable sculptures on this, the western front, having been replaced without (as I un-

derstand) any retouching of the statuettes of Giovanni Pisano. None of the sculptures on the exterior of the church have been removed to give place to works absolutely new, except a few of the relievo heads or pinnacles, so injured that it was necessary to substitute copies, two of which, lovely in character, and well executed by a young Pisan artist, I saw in an adjoining workshop. In the restoration of the traceried windows all the glass will be renewed, and with colouring, which had almost entirely faded away from the much damaged glass of the fourteenth century. Some of these windows had been long walled up, but will be re-opened and supplied with coloured plates like the rest. In so far as it has been necessary to renew the white and black marble, such material has been obtained from the same quarries in the neighbouring mountains out of which the ancient S. Maria del Ponte was built; but I am glad to see that much of the marble structure remains so firm as to require no substitution of new for old material.

As this exquisite little church now rises before us, it looks, when seen from a distance, forlorn, and in part ruinous, excepting the now re-erected façade and the eastern end, which has not yet been touched. The whole is roofless; and the lateral walls overlooking the river are but in part restored, though three windows with delicate tracery on that same side have been replaced according to the method here carried out. An exquisitely wrought wheel window, with a lamb in the central panel, and a superb frieze below it of truly classic character (a relic, no doubt, from some more ancient, perhaps from Roman architecture), require no restorations. That frieze which, together with the wheel window, surmounts a doorway on the southern side, is an example of the admixture of the classical with the mediæval exemplified also in some rich details on the outside of the Pisan Duomo. The eastern front, which has not yet been touched in the course of these works, is so dilapidated that its condition may be deemed the measure and example of that disintegrating process for the arresting of which these labours have been undertaken. The architect engaged is Signor Michele, a Florentine, under whom is placed a superintendent charged with the daily direction of the works. The head-mason, an intelligent person, gives full information to those visiting the spot and desirous to learn what are the plans for the future fate of this justly celebrated edifice—a glory and a grace to the city of Pisa.

We may regret the dilapidation which has induced the undertaking above described. We may rejoice to remember what that marvellous church of the "Spina" was before any restorations had been attempted; but must it not be owned that those responsible have, in this instance, acted from a correct sense and just feeling of what is due to their patria and to its world-famous monuments?

C. I. HEMANS.

NOTES AND NEWS.

MR. HOLMAN HUNT has recently been engaged in painting a portrait of his son. The child is represented on his return from a successful birds' nesting expedition. He is accompanied by a couple of Pomeranian dogs. As one leaps up to him, the boy throws himself back, laughing wildly, and holding out the nest in triumph.

A VERY handsome catalogue of the plates of Turner's *Liber Studiorum*, accompanied by an introduction and notes, and illustrated with three heliotype facsimiles of three of the etchings, has just issued from the University Press of Cambridge, U.S. The editor is, we believe, Mr. Charles Norton, who has previously made many contributions to art literature. In the notes and introduction all the more important passages concerning these engravings which occur in Mr. Ruskin's various works have been brought together. The more special bits of criticism find their place under

the title of the plate to which they refer, while remarks which apply to the series as a whole are gathered into the preface. Mr. Norton has also enriched the catalogue with many pertinent comments and references. A list of the unpublished plates, and a note on the present market value of the engravings, completes the work, which should be in the hands of every collector of the *Liber Studiorum*.

IN the large miscellaneous collection of engravings sold this week at Sotheby's, there was little to demand notice, save two of the unpublished proofs from Turner's *Liber Studiorum*, which, as they are even rarer than the published prints, are by some collectors even more eagerly sought after. The *Glaucus* and *Scylla* was knocked down for 22l. 10s., and the *Apulia* for 29l. 10s. Both were brilliant impressions.

THE marble head in the Louvre, known from its former possessor as the "Talleyrand head," and of late generally described as representing either Dionysos himself or some person of his suite, has been brought forward by Professor Kekulé, of Bonn (*Arch. Zeitung*, 1874, p. 94), as a head of Zeus, and not only that, but as reflecting in its essential features the type of Zeus in the Pheidias age. If it were really known or possible to know what the Pheidias type of Zeus was, from a better source than a coin of Elis, or the injured figure in the frieze of the Parthenon, both of which after all are only identified by conjectures, the discussion would be more profitable, since it would proceed from a more solid base. No doubt there is something of the aspect of Zeus in the Talleyrand head, and it is not to be denied that the diadem ornamented with lilies, which hitherto had furnished an argument in favour of Dionysos, is now by Professor Kekulé's paper shown to be appropriate to Zeus above all other deities. At least so much is proved as regards the lilies. The form of the diadem itself has not, however, been accounted for.

THE well-known painter, Mr. J. B. Bedford, has been elected to the Professorship of Drawing at Queen's College, London, on the resignation of Mr. Cave Thomas. While congratulating the college on the accession to its staff, we cannot but express a hope that the duties of the Professorship will not interfere with the production of those scholarly and graceful works of which Mr. Bedford now exhibits only too few.

BARON GUSTAF WAPPERS, historical painter to the King of the Belgians, died on the 6th instant, in the eighty-second year of his age. He was born at Antwerp, and first learned his art as a pupil of Van Bree and Heyrens in the Academy of his native city. He afterwards went to Paris, where he adopted the style of the Romantic school, which he subsequently endeavoured to unite with the national traditions of Rubens. In 1830, he exhibited his *Devotion of the Burgomasters of Leyden*, a work which established his reputation as an historical painter and placed him at the head of a school of his own. He successively painted *Christ at the Sepulchre*, *Charles I. taking leave of his Children*, *Charles IX. on the Night of St. Bartholomew*, *Peter the Great at Zaardam*, *Execution of Anne Boleyn*, and many other well-known works. Louis Philippe ordered him to paint the *Defence of Rhodes by the Knights of St. John* for the Gallery of Versailles, and by command of Her Majesty he painted the *Great Fishery of Antwerp*. Baron Wappers died at Paris, where he has resided for the last twenty years.

In a sale, on the 7th, at the Hôtel Drouot, the tapestries were sold at a high price:—(103.) Four arm-chairs and two chairs, period Louis XIV., covered with Beauvais tapestry (Fables of La Fontaine), 1,000 fr.; (123.) Three panels of Gobelin tapestry, pastoral subjects, 4,920 fr.; (124.) Gobelin tapestry, pastoral subject, after Boucher, 5,000 fr.; (126.) Four tapestries, pastoral subjects, in the style of Boucher, 3,940 fr. On the

same day were sold some modern pictures:—(7.) Daubigny, *Banks of the Oise*, 3,060 fr.; (9.) Dupré, *Jules*, Sea piece, 1,225 fr.; (12.) Landelle, *Fellah Woman*, 1,460 fr.; (14.) Merle, *Hugues*, *The Seasaw*, 840 fr.; (15.) Plassau, *Reading*, 3,200 fr.; (16.) Ribot, *Cooks*, 1,205 fr.; (20.) *Venetian Artists*, 1,550 fr.; (24.) Van Marcke, *Animals on the Sea-shore*, 5,200 fr.; (30.) Ziem, *View of Venice*, 7,000 fr.

THE model which has been prepared by the German sculptor Hutterer, from Hansen's design for the new parliamentary buildings in Vienna, appears to give general satisfaction. German critics, and even rival architects, speak of it in the highest terms of praise as being "one of the most imposing and the same time beautiful conceptions of modern architecture." The difficult problem of adapting Greek architecture to modern service has in this instance, it is declared, been solved. The building is very rich in plastic decoration.

A SUCCESSFUL series of photographs from the pictures in the Augsburg Gallery has been issued by the well-known photographers Röhring and Frisch, of Lübeck.

THE Italian sculptor, Gaetano Barzaghi, is at present working upon an equestrian statue of Napoleon III., which is to be set up in Milan. It represents the late Emperor responding to the enthusiastic reception he met with on his entry into Milan, and is designed as a memorial tribute from that city. The statue is of life-size, and will be cast in bronze and placed upon a base of marble decorated with bas-reliefs.

THERE has lately been exhibited in the Royal Manufactory for Glass Painting at Munich a splendid window designed for a church in Melbourne. The subject of the painting is the Ascension of Christ, from a design by N. Blaim.

IN the *Portfolio* for this month, Mr. C. T. Newton, continuing his article on "Greek Art in the Kimmerian Bosphoros," gives some interesting details respecting the painting on Greek vases. The earliest in date of these were simply painted in black on a red ground, afterwards red on a black ground was introduced, but up to the age of Pheidias the vase painters kept strictly to monochrome outlines, and seldom attempted foreshortening. The polychrome paintings belong to a later period. Several beautiful examples of these are quoted, in particular the vase found by MM. Biliotti and Salzman, in Rhodes, now in the British Museum, on which is represented in brilliant but harmonious colour the myth of Peleus and Thetis. The jewellery found in the Crimean tombs is also investigated.

The illustrations of the number are: an effective etching by L. Gaucherel from a water-colour by Inchbold, representing Charing Cross Station and Bridge from the other side of the river; the usual National Gallery picture, this time an etching by Rajon of Nicolas Maes' *Dutch Housewife*; and two little plates by J. Vaillant exhibited last year at the Dudley Gallery.

With this number the editor, P. G. Hamerton, finishes his "Sylvan Year," and the volume for 1874 is completed. It is published as a handsomely bound volume by Messrs. Seeley and Jackson, and forms one of the most charming and artistic gift-books of the season. The programme also for next year promises well.

ACCORDING to the *Augsburger Allgemeine Zeitung*, Eugène Plon, Thorwaldsen's French biographer, is empowered to prepare a Thorwaldsen Museum within the precincts of the Louvre. This has been suggested before. In 1849 Charles Blanc went to Copenhagen in an official capacity to make arrangements for receiving casts of the Danish master's statues, and actually returned with some completed. In 1851 what he had brought back with him, and others since received, were taken into the Louvre, where they disappeared. Eugène Plon's perseverance and energy have just unearthed

them from a mass of rubbish in a vault, and soon they will be exhibited to the public, and the collection made as complete as possible.

HERR F. BODENMÜLLER has received an intimation from high quarters that it would afford satisfaction to the German and Austrian Imperial Courts if he would exhibit at Berlin and Vienna his great painting of the battle of Wörth, which has been seen and cordially approved of by the German Emperor. The picture has been exciting considerable notice at Munich, where it was exhibited for public inspection in the Royal Art Academy, and it is understood that Herr Bodenmüller intends, in the event of his failing to meet with a purchaser for it, to send it for exhibition to the chief garrison towns of Germany, before he consigns it to the hands of the engraver.

GREAT interest is being excited at Vienna through the discovery by Professor von Engerth, director of the Vienna Academy of Arts, of several pictures by Jakob Seisenegger, the Court-painter of Ferdinand I., whose works have hitherto not been known, although there existed sufficient documentary evidence to show that his contributions to art had been entitled to the respect and admiration of contemporary and later critics. Herr von Engerth has recently published a report, divided into two parts, in which he has set forth at length the proofs by which he has been led to consider it as an established fact that the miniature of Queen Anna on the title-page of the Prayer-Book of her husband, Ferdinand I., is the work of Seisenegger; and that the portrait of the Emperor Charles V. in the Belvedere Gallery, which was long attributed to Titian, is in reality the production of the same long neglected Court-painter. The clue to this discovery was originally supplied by Herr Joseph Bergmann, the deceased Director of the Imperial Numismatic and Archaeological Museum, and by Councillor Birk, Director of the Court Library, through whose suggestions Professor von Engerth was led to ascribe, on apparently incontrovertible grounds, this assumed Titian to a genuine German master. It would appear from the facts established by these zealous and trustworthy investigators, that Jakob Seisenegger was born in 1505, and obtained the appointment of Court-painter to Ferdinand I. at the age of twenty-six, with a salary of 60 ducats. In the year 1533 the Emperor Charles V. offered him an annual pension of 200 ducats if he would enter his service, but he remained true to his master, with whom he went to Augsburg in 1550. He has left us a list of his paintings, drawn up by his own hand, and from this it is made evident that he painted a large portrait in oils of the Emperor while the latter was at Bologna, whither Titian had also been summoned for a similar purpose. According to Seisenegger's description of his own work, the Emperor was represented in a white mantle, embroidered in silver and lined with fur, and wearing a white gold-laced close-fitting vest, white hose and white velvet shoes. In his hand he held a black baret cap, with a long white feather, and carried at his side a Spanish rapier and a gold dagger. He was standing on a marble pavement with green silk draperies behind him, and an "English" dog at his feet. The price of this work was 50 Rhenish gulden, a very modest sum when compared with the 60,000 silver roubles which, we are told, is to be the remuneration awarded to Herr Angely, that favourite painter of royalty in our times, for his proposed picture of the Russian Imperial family at Livadia. It is evident that Seisenegger in this work, which is believed to be identical with the Belvedere portrait, has taken Titian for his model; and to the success with which he has done this, in regard to certain points, is mainly due the misconception which has long existed as to the real master. Since this discovery of Seisenegger's Charles V., several other portraits by the same hand have been detected at Madrid and in other Spanish and Austrian collections. The most noticeable of

these are a fine large picture of the Empress Isabella and her children, one of Philip II., and also of the Princess Anna, daughter of the deposed King Christian II. of Denmark.

THE STAGE.

The Romance of the Stage. By Percy Fitzgerald, M.A., F.S.A. In Two Volumes. (London: R. Bentley & Son, 1874.)

THE romance of the stage is probably greatest to those who see it from the stalls or the pit. To do that is the good fortune of most of us, who can thus preserve our illusions—thus even unconsciously credit every well-graced actor with at least a little of the sentiment of his part. And yet, of course, we all know secretly that nothing can be more prosaic than the daily exhibition of emotion produced to order. Most professions, not dealing with emotion, leave it untouched and apart. But actors, in giving poetry to our prose of life, are apt, one supposes, to make prose of what might be their own poetry. In obedience to their vocation, they must be exalted with love raptures very punctually at half-past eight, and in the depths of despair as punctually at a quarter before nine. Thus there is bred perhaps in some of them a very matter-of-fact mind. A draper's apprentice may be romantic, but hardly an *ingénue*: a grocer, but hardly a comedian. The romance of the stage is for Pendennis, and not for Arabella. But now and again, of course, the stage, like any other profession, offers careers which may be romantic. These rare careers Mr. Fitzgerald has seized, and grouped their stories together into a couple of volumes.

And now that the interest in the stage is distinctly reviving—now that it is getting to be a little old-fashioned to have a polite contempt for the theatre—this book is sure of a welcome by a large circle of readers. Other writers, and Dr. Doran the last of them, have attempted more systematic histories of the stage. There is no system in the book before us, except the easy system of aiming only to be interesting. The summits of stage life, and its depths, have alone been chosen here for a kind of treatment which the libraries will find popular. We have the story of starving Gerald Griffin, knocking to no purpose, with his manuscript tragedies, at the only three stage doors the town then boasted of. We have the story of Edmund Kean's triumph, and the story of the faithful love which Florizel made to Perdita—a Prince of Wales to Mary Robinson.

There has not been any great research in the getting together of these stories. It is true Mr. Percy Fitzgerald has been to the British Museum, has turned over the file of a thousand play bills, and has read the memoirs which many actors who led strange lives a hundred years ago either wrote of themselves or got to be written for them. These memoirs were for the most part penned long after the incidents which they record took place. It is natural that actors' memories should be very good, but we begin to doubt the accuracy of the recollections that enable them, now and again, to describe far away incidents with some-

thing of the particularity of Mr. Crabtree when he mentioned to Lady Sneerwell the course of Sir Peter's ball, which, though it missed, "struck a little bronze Shakespeare that stood over the fire-place, grazed out of the window at a right angle, and wounded the postman, who was just coming to the door with a double letter from Northamptonshire."

Mr. Fitzgerald, we say, has not pursued very profound researches, but he does not claim to have done so. What he says is, that nothing hitherto published has placed before the public "what may be considered the most interesting and characteristic feature of theatrical memoirs. Their chief attraction is found to be the air of personal confession, and simplicity of the revelations furnished—the naïveté, the humour, the almost garrulous confidence; above all, the quaint turn of expression in which everything is unfolded. A selection," he says, "of such entertaining passages seemed likely to present a better idea of the player's nature and character than the more official and historical accounts with which the public is already familiar." We are rather at issue with Mr. Fitzgerald—as a remark above will have implied—as to whether these selections afford to the public the best idea of the player's "character," but they do afford to the public the opportunity of reading an entertaining book, and of getting some picturesque glimpses of last century life in various corners of London and the country: they plant us quickly in the midst of an old-world social Bohemia, which had its headquarters now in Drury Lane, and now at York, or at Bath—a Bohemia not so poetical as Henri Murger's; as impecunious as Mr. T. W. Robertson's; and differing from the Bohemia of the present day in that its inhabitants did not, to recall the French proverbial phrase, finish at the Morgue just because they could not finish at the Academy. It was a not altogether unhealthy Bohemia, such as Hogarth painted in his *Strolling Actresses dressing in a Barn*: a Bohemia of dearly-loved freedom, such as Mr. Browning has suggested in *Fifine*.

There was one check, however, upon the strolling player's or provincial player's freedom, and that was the position in which he stood to his habitual patron, the stolid and well-to-do inhabitant of the country town. Dickens, in *Nicholas Nickleby*, has wrung some humour out of that position.

"The bespeak," says Mr. Fitzgerald, "the waiting on local patrons at their houses, the rude devices for scenery and properties, of which the 'pumps and tubs' were a figure—these were but lingering remnants of the old days in the last century, when Tate Wilkinson commanded at York and Hull, Austen at Chester, and Stephen Kemble in the North. Their necessities and shifts had taught the players wit, or at least liveliness and good humour; and nearly all were remarkable for social gifts and oddities which excited a sort of interest and tolerance in the town and country folk who were their supporters. It is evident, however, that this fellowship must have entailed a certain dependence which was rather humiliating. We hear of the squireen at the indoor calling on the landlord to "turn that actor out of the bar," of officers in the boxes requiring other unfortunate players to beg pardon on their knees, with other stories of servitude. And yet, odd as the conclusion may appear, this contempt

may argue a keener relish in the drama than is found at present, when, in rural districts, the interest has grown too languid even to take offence."

Perhaps the best specimen of the country theatre in the second half of the eighteenth century was that at York. It was managed by Tate Wilkinson, and was really a provincial "school" for actors, but—unhappily perhaps for London—a school in which they were willing to remain. Still, many of them—nearly all indeed whose fame remains to this day—did sooner or later come to town. Mrs. Siddons, having first failed in London, was well received in York. Kemble, Fawcett, Jordan, Inchbold, and many others, were trained in York, and went up to town on the strength of York successes. One actor, much esteemed in York, went up to London to see and to criticise, but by no means to act. This was Frodsham, who had formed himself as an actor on a model of his own designing. He was in person rather like to "Powell of London," so his manager tells us; "but Powell," he continues, "had the opportunity of strictly observing real artists—Garrick and Barry—in all their modes and shapes of grief. Inattentive Frodsham, unhappily, was his own master, and a careless one." Therefore it was more from curiosity than with the intention of learning, that Frodsham, with his York honours upon him, journeyed to London. There is a funny story of his interview with Garrick, which illustrates Garrick's conscious eminence. The greatest English actor knew his position so well, that he was not so much offended as amazed and confounded when anybody else was put into comparison with him. "Mr. Frodsham of York" presented his card, and was eventually admitted to Garrick's presence:—

"Pray, now, have you seen a play since your arrival in London?"—"Oh, yes," quickly answered Mr. Frodsham, 'I saw you play Hamlet two nights ago,' to which he added it was his own favourite character. 'Well,' says Garrick, 'pray now, how did you approve, Frodsham? I hope I pleased you:' for that night he had judged his performance a lucky hit. Frodsham replied, 'Oh yes, certainly, my dear sir, vastly clever in several passages; but I cannot so far subjoin mine to the public opinion of London, as to say I was equally struck with your whole performance in that part.' I do not conjecture that any actor who spoke to Garrick ever so amazed him. Garrick stammered, and said, 'Why—why now, to be sure now, why I suppose you in the country—Pray now, Mr. Frodsham, what sort of a place do you act in at York? Is it in a room, or riding-house, occasionally fitted up?'"

"Well, Mr. Frodsham, why now, well, that is, I suppose you saw my Brute last night? Now, no compliment, but tell Mrs. Garrick; well now, was it right? Do you think it would have pleased at York? Now speak what you think!"—"Oh!" says Frodsham, 'certainly, certainly; and, upon my honour, without compliment, I never was so highly delighted and entertained—it was beyond my comprehension: but having seen you play Hamlet first, your Sir John Brute exceeded my belief; for I have been told Hamlet, Mr. Garrick, is one of your first characters; but I must say, I flatter myself I play it almost as well; for comedy, my good sir, is your forte.'"

And then Frodsham himself began to recite, never daunted by the strange power of Garrick's eyes fixed upon him. When he had

finished Hamlet's first speech, Garrick encouragingly said, "You have a smattering, but you want a little of my forming. You have acquired tones I do not by any means approve." "Tones! Mr. Garrick. To be sure I have tones, but you are not familiarised to them."

In stories the like of this Mr. Fitzgerald abounds, and they are more legitimately placed in his volumes than are the records of the life of Miss Ray and Mrs. Robinson; for Miss Ray can hardly be considered as other than an opera-singer who was the mistress of a peer and was murdered by a clergyman; while Mrs. Robinson, though Garrick thought well of her making her *début* in Juliet, would never have been remembered at the present day but for the loves with which the future George the Fourth pursued her. She was Perdita, as all readers of old scandals know—an actress of no great talent, but of much beauty: a woman neglected by her husband, and courted by the Prince. She began her life under the shadow of the Bristol cathedral; was taught by the sisters of Hannah More; and from that quiet life passed on to be the woman most remarked in all London, and afterwards to write, in paralysed old age, romantic and high-flown narratives of the fascination of her Prince. The chapter on Elliston is amusing: the man's eccentricities were remarkable. Some of them—such as the faculty of drawing up theatrical advertisements which belonged only to the "puff indirect"—were profitable also. But since his day, genius has been shown more frequently in advertising. The advertisements of Mr. Robins, the auctioneer, are historical, and the theatrical announcements "over the clock" in the *Times* newspaper any morning bear entertaining evidence that this genius is not extinct. Elliston, master of the puff indirect, has at least one worthy successor; but we thank Mr. Fitzgerald for exhuming for us these forgotten and amazing compositions of his, which prove surely enough that genius is not of yesterday. Mr. Fitzgerald's volumes, with all their drawbacks, are the "abstract and brief chronicle" of many a character. It behoves us, then, to see that, like the players themselves, they be "well bestowed."

FREDERICK WEDMORE.

NOTES AND NEWS.

MISS HELEN FAUCIT appeared as Beatrice in *Much Ado About Nothing* last Saturday afternoon at the Haymarket Theatre, for the benefit of the General Theatrical Fund. By those who are accustomed to the theatre the audience was easily remarked as a peculiar one, for while it included many actors now practising their art, and several illustrious players now retired, it included also very many persons who go but seldom to the theatre, and who, whatever may be their culture and whatever the range of their interests outside the playhouse door, are little fitted to pronounce upon an art with which they are unfamiliar. Thus it was that Miss Faucit's representation was most applauded at a moment by no means its best, and thus it was, no doubt, that she was summoned to re-appear upon the stage while yet some necessary business of the scene remained to be transacted by her comrades. This invitation, we are delighted to say, Miss Faucit declined, though when the comedy was done she properly received her

bouquets. Her performance, on the whole, was not below her reputation, when we make allowance for the obvious disadvantages of a lack of youth, and a lack just now of constant practice at the theatre. Her reading of the character of Beatrice is that of a singularly vigorous mind: her execution is that of a clever woman still fully possessed of many gifts and acquisitions, though a little unaccustomed to the use of them. Her voice preserves much of its freshness and flexibility; her happiest gestures continue admirably the sense of a phrase, prolonging its significance. But her gestures are not always happy, in that there are sometimes too many of them, and that thus there is forced upon us a want of repose: continual motion—never actual restlessness. Her studied method suits the bright sword-play of Shaksperian comedy better than its more serious situations: the elaboration is well placed in a measured combat of wit, but at points more intense, though the emotion comes, it comes a moment late. But no one can witness her performance of Beatrice without in some degree profiting by it, and the younger actors and actresses who were present on Saturday took note, it is to be hoped, not so much of the absence of spontaneity, fire, and passion, as of the value of concentrated attention, perfectly balanced understanding, and elaborate care. Mr. Creswick, who was Benedick, did not look the part very completely, but he played it with thoughtfulness, discretion, and spirit. Mr. Fernandez was Don Pedro, Mr. Charles Creswick was not a good Claudio, nor upon the part of Leonato did Mr. Rogers throw any new light. Dogberry was acted by Mr. Compton, who gave a finished performance, disfigured to our thinking by certain mannerisms which it is perhaps now too late to amend. They are equally perceptible in his Dogberry and in his First Gravedigger in *Hamlet*. The Verges of Mr. Righton was an admirable representation of extreme old age and helplessness. The gaze, sometimes vacant, but more often bewildered; the reliance upon Dogberry's less tottering wisdom; the satisfaction and relief when that wisdom came to the rescue of his own irresolution—all these things were excellently marked, yet were never exaggerated. Mr. Righton's performance therefore appealed not so much to the admirers of traditional stage humour as to those playgoers who observe closely in life, and know the value of delicate touches and delicate effects in art. As Hero Miss Minnie Walton was befittingly simple and ingenious, though in the marriage scene rather lacking in force. It was difficult to believe that she thoroughly realised all the situations through which Hero was passing. Yet the performance had promise in it. In addition to the actors and actresses we have already named, Messrs. Russell, Cooper, Weathersby, Bruce, McIntyre, Cathcart, Barsby, Maclean and Temple, and Miss Eleanor Bufton, and Miss E. Farren, took part in the representation, and Mr. George Perren sang the incidental song.

MR. JOHN MITCHELL, who died on the 11th inst., was neither actor, author, nor critic, yet for some time the direct influence he exercised upon the higher stage was second to none. For fifteen seasons he managed the French plays at the St. James's Theatre, where he introduced Mdlle. Rachel to the English public. She was but one, though the most prominent, among many of the greatest artists of the day whom Mr. Mitchell was instrumental in bringing to London.

MR. AND MRS. KENDAL have been acting at the Crystal Palace. On Tuesday they played Claude Melnotte and Pauline in *The Lady of Lyons*, and on Thursday, Orlando and Rosalind in *As You Like It*.

A COMIC play, by the late Captain Hartopp, now begins the evening at the St. James's Theatre, where the *Black Prince*, with Lecocq's music, and the singing and acting of Miss Dolaro, is continually attractive.

MISS LYDIA THOMPSON and her company will go, as has been announced, from the Charing Cross to the Globe Theatre at Christmas, when the burlesque of *Blue Beard* will renew its youth and be a pantomime; and Miss Thompson's place at the Charing Cross will be taken by Miss Carry Nelson.

THE play of *David Garrick* is announced to be in rehearsal at the Haymarket.

AN early comedy of Mr. Henry J. Byron's—*War to the Knife*—is now performed before *Laion* at the Opera Comique Theatre.

It is understood that M. Emile Augier is writing a play for the Paris Vaudeville. He works very slowly, and since the war he has produced but one important piece—*Jean de Thommeray*, at the Français—and it must be remembered that the production of a new play by him is as much of an event in the literary world of Paris as is the production of a new novel by George Eliot in the literary world of London.

MDME. CHAUMONT has just been acting at the Grand Théâtre of Lille.

MDME. MARIE-LAURENT played *Athalie*, in Racine's tragedy, at the second matinée at the Paris Gaiety last Sunday.

MDLE. SARAH BERNHARDT has re-appeared at the Français, in the very witty little one-act comedy by Paul Ferrier, called *Chez l'Avocat*.

ARE those good days coming again for the old and seemingly somewhat decayed Théâtre de l'Ambigu? M^{me}. Fargueil is to act there the principal part in an important drama, *Rose Michel*, and M. Regnier, of the Porte Saint Martin—whom nobody must confuse with the late *doyen* of the Théâtre Français, and present professor at the Conservatoire—is also to be included in the cast.

Les Deux Comtesses—the new three-act comedy by M. Eugène Nus, at the Gymnase—has recalled to more than one spectator certain scenes in Balzac, in which "le Colonel Chabert" figures most prominently. Of course the new piece lacks, as M. Auguste Vitu says it lacks, the magic colour, the *chiar-oscuro*, of pages that are remembered vividly by readers of Balzac. On the other hand, it has the advantage of presenting several characters in forms less repulsive, if less powerful:—"La comtesse Feraud, de Balzac, est une femme odieuse que le troupier Chabert avait ramassée dans la fange, et qui, traduite à la scène, n'eût excité qu'un dégoût inconciliable avec le sacrifice que lui fait une rivale légitime." M. Eugène Nus, en homme de goût, qui connaît les conditions du théâtre, n'a mis en présence que des malheurs involontaires, entre lesquels se partagent également la pitié et l'intérêt du spectateur. Tous les personnages sont d'honnêtes gens, qui ont fait leur devoir et tout prêts à le faire encore. C'est là, un genre de mérite qui devient très rare au théâtre." The piece, it is further said, gives a true picture of the manners of the period of the return of the Bourbons—manners which preserved something of the dignity of the old régime—and moreover it is written by a man of delicate and acute observation. Achard and Pujol appear in it successfully, but it is M^{me}. Legault who has most distinguished herself in a heroine's character that is fresh and sparkling.

THERE was an impression in theatrical society that the *Maitresse Légitime*, by a little-known author—M. Louis Davyl—would be sure to fail at the Odéon, and it was only produced with the hope that it might fill the interval between two notable successes. It had a dangerous title, if "legitimate mistress" meant, as it was said to mean, a woman who by reason of her long fidelity to her lover established some claim at least not to be classed among the wholly abandoned of her sex. The whole ground was dangerous, and there can be little doubt that the author did at first intend to attack the views of Society, in defence of such

a woman as this. Before long, however, he seems to have perceived that arguments of the kind he wished to use were by no means fitted for the theatre. Thenceforth he confined himself to the regions of sentiment, and by a rather unusual *tour de force* managed to write a story both witty and touching. The cast, which is a strong one, includes M^{lle}. Blanche Baretta—who is making way towards the Français—M^{lle}. Léonide Leblanc, M. Talien, and M. Porel.

THE Vienna Stadttheater has made a hit with a one-act comedy, *Ein Feuilleton*, by Karl Gross (a journalist), and with the three-act play of *Feder und Schwert*, by Gustav Gerstel. The Stadttheater has produced about two dozen pieces within the last two months.

MUSIC.

CRYSTAL PALACE CONCERTS.

THE announcement of Schubert's great Symphony in C major in the programme of last Saturday's concert at the Crystal Palace was sufficient to attract a large number of enthusiastic hearers; and those who went were amply rewarded for their trouble by one of the most magnificent performances of the work that has ever been given even under Mr. Manns. It is very interesting to notice the change in public opinion with regard to this work since it was first produced in London. I have before me as I write a criticism from the pen of one of our ablest musicians of the first performance of the symphony by the late Musical Society of London in 1859, in which it is spoken of in very cool, not to say disparaging, terms; and it is no doubt the fact that at first it failed to gain the public ear. But frequent repetitions have rendered it familiar to our audiences, and there are now few, if any, works of its class which are more heartily enjoyed by amateurs. Nor is this at all to be wondered at. In spite of its great length—it occupied on Saturday, even with the omission of all the repeats, forty-eight minutes—it is so full of delightful melody, of those magical changes peculiar to Schubert, and of exquisite instrumentation, that it rivets the attention of the hearer to the last bar. In this, the last of the composer's symphonies, written but a few months before his death in 1828, at the early age of thirty-one, we find him (as also, in his great Mass in E flat, and his quintett for strings in C, which were written in the same year) breaking entirely new ground; and one cannot but think what he might have given us had his life been spared to the age of Haydn, or even of Beethoven, and regret the loss to art occasioned by his premature removal. The present symphony is a unique work; and not the least striking thing about it is its complete freedom from the Beethoven influence, though written shortly after that great master's death, and in Vienna, the place where at that time his music was probably the best known. In some of Schubert's earlier compositions it is easy enough to find traces of Mozart and Beethoven, but he subsequently completely emancipated himself, and in this work there is nothing approaching a reminiscence, even in style. Nor, on the other hand, has it served as a model to more recent writers. With the exception of one or two faint echoes of the music in Schumann's symphonies in B flat and C, I know of no modern composition which in the least reminds one of this. A detailed analysis of this symphony would be most interesting, but would far exceed the limits possible for this notice. To those readers of this paper who can procure it, may be recommended the excellent notice by "G." printed in the programme of last Saturday's concert. Only one point can be touched on here, and that is the extreme novelty of the orchestration. In the whole of Beethoven's scores nothing can be found at all resembling Schubert's treatment of the wind instruments, especially the horns and trombones.

And this novelty is the more remarkable if it is remembered that the composer was guided, so to speak, solely by musical instinct, as he had few opportunities of ever hearing his works played by an orchestra. But from his earlier days he was an innovator in this respect. In his very first mass (that in F, written at the age of eighteen) are to be found effects for the brass (especially in the "Domine Deus" and "Credo") which seem to foreshadow passages in his last symphony. These effects have frequently since been imitated, but to Schubert undoubtedly belongs the credit of their invention.

The performance of this great work, as already mentioned, was magnificent—it might almost be called an ideal one. It was not merely note-perfect, but it was characterised by an attention to the *nuances*, and a finish of phrasing such as can be heard nowhere in such perfection as at Sydenham. It was indeed a veritable triumph, both for Mr. Manns and his band.

Of the remainder of the concert only a few words need be said. The overtures were Mendelssohn's *Meeresstille (Calm Sea and Prosperous Voyage)*, and Wagner's *Rienzi*. The former, though highly effective in its details, is less satisfactory musically than many of its composer's works; and the latter, while extremely brilliant in its orchestration, is the least "Wagnerish" of all Wagner's preludes, being in parts (what its author very rarely is) commonplace. The only absolute instrumental novelty of the concert was Raff's "Evening" Rhapsody, an effective little movement, which, it is stated in the programme, has been arranged by the composer from one of his pianoforte works. The vocal music, it is pleasant to say, was of more than average excellence, and contained none of those weak and even trashy ballads which sometimes disfigure the Crystal Palace programmes. It should, in passing, be said, in justice to Mr. Manns, that when these are given they are selected not by him but by the vocalists themselves; and the singers last Saturday, M^{me}. Lemmens-Sherrington and M^{me}. Patey, showed alike their good taste and their respect for their audience by their choice of pieces. The former sang Weber's scena "Non paventar," from *Ines de Castro*, and two of Rubinstein's quaint and interesting "Persian Songs;" while M^{me}. Patey brought forward a song from Mr. W. G. Casins' oratorio *Gideon*, and Gounod's "Berceuse." That all were well sung it is superfluous to add.

Ebenezer Prout.

A DISAPPOINTMENT was experienced by visitors to Monday's Popular Concerts—the last before Christmas. The *pièce de résistance* of the evening was to have been the ever-popular "Kreutzer Sonata" of Beethoven, played by Mr. Charles Hallé and M^{me}. Norman-Néruda. Unfortunately the lady was so unwell that although she had bravely gone through her previous share in the programme in spite of illness, she was unable to continue, and an apology had to be made for her. Mr. Hallé substituted Beethoven's Sonata Pastorale. The novelty of the concert was a "Sonata da Camera" for violin with pianoforte accompaniment, composed by Locatelli, and played by M^{me}. Néruda, Mr. Hallé accompanying. The name of Locatelli will probably be new to the majority of our readers. He was a distinguished violinist of the last century, a native of Bergamo, and a pupil of Corelli's. His compositions, which are mostly for the violin, are not only elegant but, considering the time when they were written, remarkable for the novelty of their effects. As a proof how far they were in advance of their age may be mentioned the fact that a French reprint of one of his sets of Caprices bore the title "Caprices Enigmatiques." The quartett with which the concert opened was Mozart's No. 9, in B flat, one of three which he composed for Frederick William II. King of Prussia. As his Majesty was an amateur player on the violoncello, the part for that instrument in these works is

especially prominent. It will be readily imagined that in such hands as those of Signor Piatti on this occasion it lost none of its importance. The work was led by M^{de}. Norman-Néruda, the second violin and viola being sustained by Messrs. Ries and Zerbini. In place of a sonata, Mr. Hallé played two solos by Chopin (the nocturne in E, and the barcarolle in F sharp major). Mr. Sims Reeves being still too unwell to appear as announced, his place was filled by Mr. W. H. Cummings. This afternoon the last for the present of the Saturday concerts will be given, with a most interesting programme; and the next of the "Monday Populars" is announced for January 11, when M^{lle}. Marie Krebs will make her first appearance at these concerts.

The excellence of the programmes of the Royal Albert Hall concerts has been fully maintained during the past week. In consequence probably of the difficulty of getting sufficient rehearsals for so exacting a work as Beethoven's Choral Symphony, which had been originally announced for Wednesday, a "Mendelssohn Night" was substituted for an evening with "Beethoven: Third Period." The change was doubtless a judicious one; for an inefficient rendering of Beethoven's masterpiece would be, for performers no less than for the audience, little short of a martyrdom. It is rumoured—though not yet, we believe, officially stated—that after Christmas these concerts are to be given on three evenings a week instead of nightly. The change seems a probable one, for it is hardly possible to see how they are to be made pecuniarily successful as at present carried on. Thoroughly as they deserve support, they labour under great difficulties in consequence of the position of the Albert Hall, which is so far distant from a great part of the metropolis that the time occupied in the journey to and fro is a serious matter. Whatever action the directors may see fit to take in the matter, it is to be earnestly hoped that their enterprise may not ultimately fail. During the few weeks since the concerts commenced, an amount of good has been done by the production of new or seldom-heard works which is worthy even of the Crystal Palace itself.

THE last number of the *Musikalisches Wochenblatt* gives a detailed criticism of the recent performance by the Riedel'sche Verein at Leipzig of Friedrich Kiel's oratorio *Christus*. With reference to the work it says: "Kiel's oratorio does not belong to those creations which surprise through originality of invention and novelty of conception; but, on the other hand, it is a proof how a thorough comprehension of the subject can lead, even within the limit of traditional forms, to achievements of real effectiveness. . . . We must add that Kiel's oratorio is not in all parts maintained at the same height of excellence; nevertheless, it is as a whole a work which few of its class will be found to equal."

It is intended to erect in Nivelles (Belgium) a monument to the old musical theorist Johannes Tinctoris, the author of the first musical lexicon, entitled *Terminorum Musicae Diffinitionum*, who was born in that town in 1435.

A NEW theatre is to be erected in Paris on the site formerly occupied by the hotel of Prince Metternich in the Rue de Grenelle-Saint-Germain, at a cost of 2,000,000 francs.

BEETHOVEN's great "Missa Solennis," has recently been performed in the church of St. Gudule at Brussels.

In the last number of *Dwight's Journal of Music* is reprinted from the *Daily Advertiser* a most amusing description of the recent performance of Wagner's *Tristan und Isolde* at Munich. The writer must either have intentionally misrepresented the argument, or be most imperfectly acquainted with the German language, as his description of the plot is a mere burlesque. The effect produced on him by the work he thus describes: "On the whole, I was very much

interested throughout, but glad to be released, as the tension on the nerves is too great, and lasts too long."

EDVARD GRIEG has just published his music to Björnson's drama of *Sigurd Jorsalfar*, and has been lingering in Copenhagen expecting to be required to set parts of that poet's new piece for the Royal Theatre. However, through some mysterious misunderstanding, not yet revealed to the public, neither of Björnson's comedies will be performed this winter, and Grieg has accordingly travelled to Leipzig, to bring out there his music to *Arnljot Gelline*.

THE Christmas performances of oratorios with allegorical pictures at the Vienna Musikverein were begun last week. The "Christmas Cantata," by the Russian composer Friulein Ella Adajevsky, which was produced on this occasion, had but very little success.

WE learn from Cologne: "At the last Gürzenich-Concert, Tuesday, 15th inst., Grieg's pianoforte concerto, known in London through Herr Dannreuther's admirable performances, was to be played by M. Louis Brassin, of Brussels, and Sir Julius Benedict was to conduct his own G minor symphony."

MDME. OTTO-ALVSLEBEN commences next week a concert tour in Germany, and will return to England in the first week of February, 1875.

A CORRESPONDENT writes to us from Vienna: The first performance of the first act of the *Walküre* took place on the 4th of this month, in the large concert-room of Bösendorfer's pianoforte depot. The reception was rapturous, and there was not the least sign of counter-demonstrations, although the performance was given without an orchestra. Kapellmeister Sucher, of the Komische Oper, and Dr. Paumgartner played the orchestra-part on two pianos. Beauties were revealed, especially in the great duet, which one would never have suspected even in a Wagnerian score. The duet has been called by critics the diamond among Wagner's works. Frau Friedrich Materna, Herren Labatt, the first tenor, and Scaria, the first basso profundo, of the Vienna Hofoper—sang their parts grandly, and received much applause. Herr Sucher and Dr. Paumgartner played the extremely difficult piano parts admirably. Another Wagner concert is being arranged for January 6, 1875, by our "Wagner-Verein," with Herr Glatz, the young tenor who is to take the part of Siegfried at Bayreuth, and on whose *début* at Pesth the ACADEMY reported last week; Dr. Krauss, the bass of our opera; the orchestra of the Opera, and the "Akademischer Gesangsverein." The programme is: Wagner's fragments from *Tristan und Isolde*, *Die Walküre*, and *Siegfried*, and Liszt's *Faust* Symphony. Hans Richter is to conduct, and the profits will be devoted to the Bayreuth Fund. Richard Wagner has addressed the following letter to Herr Scaria: "I really have the intention of coming to Vienna—perhaps about the end of February, 1875—to give to the Viennese some fragments—of course only orchestral 'Zwischenspiele'—of the *Götterdämmerung* ('Den Wienern zum Besten zu gehen'). I object to give whole scenes with vocal music; I may perhaps give 'monologues.' If I could find an introduction and a finale to Hagen's monologue in the first act, I should think of producing it. But yet I do not know how to begin it and how to close it. I am in great anxiety about Frau Friedrich-Materna, that she may not allow herself to be used up by the exigencies of the *répertoire* ('sich abnützen lässt'). She really has all we want ('allerdings hat sie das rechte Zeug'); but after all, man is man, and singer is singer. If I was only a Meyerbeer, I should take her away at once from the stage, in order to preserve such talent. For you I am not afraid; if you only stick to me faithfully, then all will be well. Entirely yours ('Ganz der Ihrige'), Richard Wagner." This letter has been reproduced in the *Neue Freie Presse*.

POSTSCRIPT.

THE *Temps* gives some extracts from a letter received by M. Lacaze-Duthiers from one of the members of the scientific commission to the remote island of St. Paul, lying to the north-east of Kerguelen. The transport *La Vire*, which brought the commission, disembarked its freight without much difficulty. The members at once took possession of some huts built of wreckage by the crew of an English steamer, which had been lost on this dangerous coast, and pressed six native fishermen into their service. They returned every evening on board their ship, but on October 5, the physicist of the party, M. Cazin, was so engrossed in the adjustment of his instruments that he refused to leave the island. During the night a great storm came on, the *Vire* dragged her anchors, parted her cables, and finally found herself, with her rigging and engines sadly damaged, about 150 miles from St. Paul. It took her twenty days to return to the island, where M. Cazin had remained with the six natives, and his colleagues had some difficulty in finally effecting a landing. However, the commission succeeded in its object, and the *Vire* is now at Ile Bourbon for repairs.

THE Rev. John Posthumus Parkinson, D.C.L., F.S.A., of Ravendale Hall, near Grimsby, Lincolnshire, died on the 7th inst. When Fellow of Magdalen College, Oxford, he edited for the Library of Anglo-Catholic Theology *The Sermons of Bishop Andrewes*, in five volumes octavo. At a later period he published an *Analysis of Bishop Butler's Analogy*, and a poem called *Giles Witherne*. The name by which Dr. Parkinson was known at Oxford was Wilson. He assumed the name and arms of his wife on his marriage with the heiress of the old family of Parkinson of Scunthorpe.

AN "Eastern Society" has just been founded in Vienna, for the purpose of exchanging products and promoting commerce with Japan and other eastern countries. A museum will be established in connexion with it, and the fullest information regarding these countries for the benefit of travellers and merchants will be published in a species of journal issued by the society.

JUST PUBLISHED,

THE HISTORY OF MUSIC (ART AND SCIENCE).

From the EARLIEST RECORDS to the FALL of the ROMAN EMPIRE. With EXPLANATIONS of ANCIENT SYSTEMS of MUSIC, ANCIENT MUSICAL INSTRUMENTS, and of the TRUE BASIS for the SCIENCE of MUSIC, ANCIENT or MODERN.

By W. CHAPPELL, F.S.A.,

Author of "A History of the Ballad Literature and Popular Music of the Olden Time." Price 10s.

In Two Volumes, royal 8vo, cloth boards, 42s.

THE BALLAD LITERATURE AND POPULAR MUSIC OF THE OLDEN TIME:

A COLLECTION OF THE OLD SONGS, BALLADS, AND DANCE TUNES WHICH CONSTITUTE THE NATIONAL MUSIC OF ENGLAND; ARRANGED CHRONOLOGICALLY, WITH REMARKS AND ANECDOTES, AND PRECEDED BY SKETCHES OF THE EARLY STATE OF MUSIC, AND OF THE AMUSEMENTS ASSOCIATED WITH IT IN ENGLAND DURING THE VARIOUS REIGNS.

By W. CHAPPELL, F.S.A.

The present Work, indispensable to all who are interested in the Popular Literature of England, is the result of many years' careful research among MSS., Black-Letter Books, and the numerous ephemeral Publications of the Sixteenth, Seventeenth, and the early part of the Eighteenth Century. The various Ballad collections, such as the Pepys, the Roxburghe, the Bagford, the Douce, the Rawlinson, &c., have been laid under contribution; whilst the Garlands collected by Pepys, Ashmole, Wood, Luttrell, &c., have furnished considerable matter in illustration of the subject. The old Dramatists have been carefully gleaned for notices of Old Songs and Ballads, and every available source likely to enrich the Work has been examined and quoted. Thus, the book is not a mere collection of Old English Tunes, but an account, Popular and Literary, of hundreds of our Old Ballads; in many cases giving entire Ballads for the first time in an accessible shape. The Two Volumes contain upwards of Eight Hundred Pages, with Facsimiles from old MSS. and Printed Books.

OLD ENGLISH DITTIES.

All the Favourite Songs selected from "Popular Music of the Olden Time," with Symphonies and Accompaniments for the Pianoforte by G. A. MACFARREN; the long Ballads compressed, and in some cases new words written, by J. OXENFORD.

Large Folio Edition, printed from Engraved Plates, cloth, 21s. Small-Type Edition, complete, cloth, 10s. 6d.; or, half-bound in morocco, 15s. The above Work is also divided into Thirteen Parts, each Part containing Twelve Songs, 6s.

N.B.—All the most favourite of the Old English Ditties are also published separately, from Engraved Plates, Large Folio Size, each 1s.

THE THREE YEARS SYSTEM.

CHAPPELL & CO., 50, NEW BOND STREET.

PIANOFORTES for HIRE, by all the Best Makers, at CHAPPELL & CO.'S, 50, New Bond Street, W.

CHAPPELL & CO.'S ENGLISH IRON GRAND PIANOFORTE, Walnut Case, 135 Guineas.

CHAPPELL & CO. now have on view PIANOFORTES, New and Second Hand, from 15 Guineas upwards. 50, New Bond Street, W.

ORGANS.—AMERICAN ORGANS, ALEXANDRE ORGANS, and ALEXANDRE HARMONIUMS may be compared together for PURCHASE or HIRE, on the THREE YEARS SYSTEM, at CHAPPELL'S, 50, New Bond Street, W.

ORGANS for DRAWING-ROOM or CHURCHES, from 45 Guineas to 250 Guineas, for SALE or HIRE, on the THREE YEARS SYSTEM, at CHAPPELL'S, 50, New Bond Street.

CHAPPELL & CO., 50, NEW BOND STREET, LONDON, W.

SATURDAY, DECEMBER 26, 1874.

No. 138, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Memoirs of the Civil War in Wales and the Marches, 1642-1649. By John Roland Phillips, of Lincoln's Inn, Barrister-at-Law. In Two Volumes. (London: Longmans & Co., 1874.)

WE have no hesitation in at once expressing our opinion that this contribution to the history of Wales during a most eventful period is an important and interesting one. The subject, so far as this part of our island is concerned, has been hitherto untouched, and the vast inedited materials in the British Museum, amongst the State papers, and in private collections, which Mr. Phillips has brought to light in the course of his researches, have, apart from their local attractiveness, great value in illustrating the general phases of the vital struggle between King and Commons.

The condition of the Welsh was not of a kind to enable them to form anything approaching to a fair and dispassionate opinion on the matters at stake when Charles finally broke with his Parliament and left London. The intense ignorance of the lower classes was perhaps owing in great part to the difficulties of internal communication, and the consequent seclusion from intercourse with any but their immediate neighbours. We perhaps hardly needed our author's grave assurance that in those days there were "no railways, not even canals," but it is certainly necessary for us to bear in mind that the highways of the period were so indifferently kept as to be quite impassable during the greater part of the year, and that such journeys as were imperative must be made on horseback or on foot. Not that the personal expenses of travelling would sound very alarming to modern ears, for from the accounts of the steward of an extensive estate at the beginning of the seventeenth century, which have been preserved, we may gather that the cost of a journey from Carnarvonshire to South Wales was but fifteen shillings, and half-a-crown was pocket-money enough for a man who had to go from Tremadoc to Oswestry and back. In giving us these facts, however, as well as the price of different commodities about the same period, it would have been better if the writer had furnished us at the same time with some information about the incomes or wages out of which these seemingly small charges were to be defrayed.

Having regard, then, to the debased state of the ordinary Welshmen, it is matter for no surprise that they were entirely led by such views as their superiors in position and education were pleased to take. The gentry

generally possessed houses in the towns nearest to them, and, unlike their more modern representatives, did not disdain to maintain their influence over the inhabitants by appropriating to themselves the mayoralties and chief offices of power. It is a noteworthy circumstance that, whilst the minds of the English people were to some extent enlightened on the merits of the dispute between King and Parliament by countless pamphlets and papers issuing from the presses of London and York, not a single sheet of printed matter in the Welsh language has been found which in any way bears upon the same question. There seems to be no doubt that the people of Wales as a body were at first brought to consider Charles in the right, their Parliamentary representatives having almost all of them adopted his cause; but when they found their towns filled with Cavalier soldiers, and their country generally grievously taxed for free quarters, the heavy material losses thus caused made them hesitate to believe that the comfortable doctrine of the divine right of kings was a sufficient excuse for such treatment. They found that the money raised under colour of paying the soldiers their arrears was generally lavished upon the Cavaliers at Oxford, while the poor fighting man was left to help himself as he best might. Under such circumstances we need not wonder at the indiscriminate sacking and plundering, both of friends and foes, which went on all over the country. For the Welshmen to have to provide money as well as food to their unwelcome guests seemed bad enough; but a time soon came when they had to part with their clothes also. A large body of Irish was landed in Flintshire, in November 1643, to help the King, much in the condition of Falstaff's immortal troop, with but a shirt and a half in the whole of it. Equally as confident as the latter of finding linen enough on every hedge, they pushed into the country, and commissioners were soon scouring through North Wales, impounding now whole suits, now doublets, now breeches, shoes, stockings and hats, besides cloth and frieze enough to rig out a thousand of them, which were sent to Chester to be made up.

The fighting capacities of the Welsh were first tried at the battle of Edgehill. Their equipments were, however, of the poorest description. According to a contemporary writer, "arms were the great deficiency," and the men stood up in the same garments as those in which they left their native fields; with scythes, pitchforks, and even sickles, they cheerfully took the field, and "literally like reapers descended to that harvest of death." In spite of these many drawbacks they fought most valorously at first, some of them even with cudgels, and they did not behave worse than many much better furnished companions when the panic produced by Hampden's arrival set in.

The prospects of the Parliament seem to have reached their lowest point in Wales and the Marches at the beginning of 1643. Pembroke was the only town in the principality which had declared against the King, and the position of the royalists in all parts else was almost impregnable. A large force was placed in Raglan Castle by the Marquis

of Worcester; and equally strongly garrisoned was Hereford, with Sir William Coningsby for its governor, backed by the influential Lord Scudamore of Holme Lacy. Cardiff Castle and Ludlow were quite as secure, while Shrewsbury was protected by Sir Francis Ottley and the Shropshire Cavaliers. Lord Keeper Williams had suspended for the nonce the exercise of his spiritual functions as Archbishop of York, and was hard at work converting the dilapidated and ruinous Conway Castle into a formidable stronghold. In Cheshire the royal cause was in somewhat less repute, and its opponents there were making themselves ready for action. Around Nantwich lived men of great weight, whose sympathies went entirely with the Parliament; this town, therefore, became the head-quarters of the party. Sir William Brereton, member for the county, took the lead in military matters, putting his soldiers in good confidence early in the year by defeating a strong force sent out from Chester under command of Sir Thomas Aston, with a view to capture Nantwich and to disperse the Roundheads there; the Cavaliers in this skirmish beat a disorderly retreat, lost most of their horses and arms, and many of them were made prisoners. As was the manner of all fighting Puritans, Brereton was content to ascribe his victory, not to the power of flesh and dry powder, but to the Lord of Hosts, and set apart a day of solemn thanksgiving. The subsequent events of this year, which are very clearly set forth by Mr. Phillips in the fourth chapter of his work, cannot have been quite so conclusive in Sir William's mind of the direct intervention of Providence. The close of 1643 saw the surrender of Hawarden Castle to the Royalists after a spirited defence by a mere handful of men, and the short but cruel campaign of Lord Byron, which nearly emptied North Wales of Parliamentary soldiers. Nantwich was again the only place of refuge in Cheshire, the distressed state of which town, we may note, is well depicted in a letter in Lord Denbigh's collection of original papers (an account of which may be read in the last report of the Historical MSS. Commissioners). This letter, dated December 21, 1643, and addressed to Humphrey Mackworth, describes the enemy as most potent in Cheshire, Nantwich surrounded, the country round about plundered, nineteen colours more of the Irish come over, and the Parliament men with no considerable force to contend against the enemy; and concludes with an entreaty to Mackworth

"to represent our forlorn condition to y^r Parliamt, for whom wee have desperately engaged our estates and lives. Wee hope they account us friends worthy of some consideration and pity, and not to suffer us to perish in the midst of merciless men."

In commemoration of the raising of this memorable siege by Fairfax early in the following year, on January 25 or St. Paul's Day, the inhabitants, until quite recently, wore sprigs of holly in their hats upon every anniversary of it.

By the time that Charles himself thought it needful to withdraw into Wales, after the crushing defeat of Naseby, the feelings of the countrymen had undergone a complete change. No part of the kingdom at the

beginning of the struggle had been more liberal with arms and money, but now was seen great cause to regret the reposed trust. The honourable fellow-countrymen, such as Lords Capel and Carbery, under whose lead they had ventured their lives and fortunes without hesitation, had been removed to other commands or had withdrawn in disgust altogether from the fight, and their places were filled with grasping adventurers bent on their own enrichment rather than on the King's interest. Of such unscrupulous characters Lord Byron in North Wales and Sir Charles Gerard in the South were fit commanders. The revulsion of feeling is largely commented on by the Parliamentary newspapers at this time; we give a short extract from one called *The Parliament's Post* for August 19, 1645:—

"Could he get no recruits in Wales? Could not His Majesty's orations (which were eloquent enough) prevail nothing on the people? Could Digby's warrants draw no more into the sad and fatal list, although they used and abused the authority of the King? The King now complains of Wales and the hearts of the people there, which, he says, are as hard and rocky as the country. Wales is at length grown wise and happy; it was as full of corrupt and malignant blood, which being now let (like a ruinous body after a long fever) it begins to recover into health and strength."

Ignorance, however, still led some people to the King's side; at least, so the Parliament thought when it determined to educate them by drawing up a declaration about this time "to inform them aright of the Parliament." The services of a writer acquainted with the country and its folk were speedily engaged, and an edifying pamphlet written and dispersed over the six counties of North Wales. This seems to have put the finishing stroke to Charles's power in the principality. Mr. Phillips writes—

"A notable fact, that the two last fortresses in England or Wales, which were held for the King, were under the governorship of two brothers. Conway, governed by Sir John Owen, was . . . surrendered to Mytton on November 18 [1646]; but Harlech Castle, of which Col. William Owen, of Brogintyn, was the Governor, was not delivered up to the Parliament before March 13, 1647, and even then on very honourable conditions."

This is scarcely correct, for one instance to the contrary occurs to us in the case of the Castle of Pontefract, which was not finally surrendered to the Parliament until about two years after the latest date mentioned above. It was under siege at the time of the King's execution, and when the news of it reached the defenders, Charles II. was at once proclaimed within the walls.

The second volume of this entertaining history is filled with copies of, and extracts from, the original letters, papers, pamphlets, &c., of the Civil War period, from whence the authenticity of the work is derived.

J. J. CARTWRIGHT.

Autobiography and other Memorials of Mrs. Gilbert (formerly Ann Taylor). Edited by Josiah Gilbert. (London: H. S. King & Co., 1874.)

In the midst of great political or religious excitement there is always a danger of books being overlooked which, whatever their in-

trinsic merit may be, deal with topics distinct from those which agitate the hour. And if this be true in a general way, the life of the wife of a dissenting minister must needs run small chance of even suitable recognition in a crisis like the present when the air seems charged with lightning, and the newspapers are full of the burning questions of the day. It appears to us, therefore, that Mr. Gilbert could hardly have published his mother's memoirs at a more unfavourable moment—unless, indeed, he had put it off any longer. In this book a passage occurs referring to an incident which happened when there was an idea of burying some one in the vault of a church which chanced to be a wine-cellar. The question was suggested, "How far does consecration go?" and it may be that Mr. Gilbert has assumed the existence of a substratum of British humanity about whom the query how far excitement about current topics penetrates is as hypothetical as the degree of consecration claimable by a wine-cellar under a church. But, however this may be, it is indisputable that he has succeeded in painting a remarkable and attractive portrait, of which the setting is at once graceful and appropriate. In effect, too, the task has been all his own, for though the first volume is mainly made up of autobiography, it strikes us that some of the very qualities which make Mrs. Gilbert so fascinating a subject for her biographer are precisely the points which militate the most against the necessary qualifications for successful personal reminiscences. Her humility and genuine self-depreciation make her tend to slur as much as possible when it is necessary for her to speak of herself as distinct from other members of the family circle, but the lines added by her son to the outline she herself has traced are as incisive as those on the copper-plate engravings, with which all the earlier portions of his mother's life and the lives of his nearest relatives were taken up.

It is impossible to imagine anything grayer than the colouring of the young Taylors' early days after the father (a book-plate engraver, who subsequently, in 1796, became a Nonconformist minister) removed, on account of his rapidly-increasing family and its consequent expenses, from the busy locality of Holborn to the village of Lavenham, in Suffolk, where he rented a largish house and garden for the ruinous sum of six pounds a year. This expensive establishment was unapproached by either coach, road, or canal; the London waggon nodded in about once a week; and it is not exhilarating to read of the flat rivers and cold slopes, and the general damp tameness of a Suffolk landscape which surrounded it. The cheerful spirits of the subject of the memoir seem to have been quite independent of external circumstances, but something of the blight seems to have settled on her sister Jane, of whom glimpses are given just often enough to make one wish that they were more frequent. With all her morbid timidity and her objection to being "drawn out" in society, she could be smart enough at times, as witness an occasion when she was suddenly asked before a largish company, "What she considered the chief defect in

the Quaker system?" "Expecting women to speak in public, sir," was the prompt reply; and we are not sure whether there is anything in the united rhythmical effusions of the two sisters more truly poetical than the few lines by Jane Taylor descriptive of the view from her bedroom window over the Roding valley after the Taylor family had removed to Ongar:—

"Twilight already stealing over the landscape shades yonder sloping corn-field, whence the merry reapers have since gathered up the precious fragment. Now all are gone; the harvest moon is up; a low mist rising from the river floats in the valley. There is a gentle stirring among the leaves of the tall elm that shades our roof—all besides is still."

This is of a higher order of merit than "Twinkle, twinkle little star," one of her contributions to *Original Poems for Infant Minds*, by which she and her sister are entitled to the gratitude of two generations of children. At Lavenham most of the family occupied themselves with line engraving, and we feel that in future we shall be unable ever to look again at an old copper-plate without a sensation of pity for the author of the weary process which Ann Taylor so minutely describes, and in which the credit and satisfaction gained are so incommensurate with the pains it entails. At first it was intended to bring Jane and Ann up as engravers by profession, but the first was relieved by death, and the second by marriage, from the necessity of working for her bread. Moreover, literature had for both more abundant charms. Ann wrote more or less all her life, leading off with an election song, and contributing occasional reviews to a then leading publication, the *Eclectic*, written in the vigorous prose which characterises all that is given of her correspondence. Therein (the *Eclectic*) she handled Hannah More's *Christian Morals* with a caustic fearlessness which quite took that worthy lady, then in the zenith of her fame, by surprise, and about which she expressed her displeasure in a manner unworthy of her genius. A review of Miss Edgeworth's *Tales* was among the same, and the last, contributed after she married Mr. Gilbert, had for its subject Miss Hamilton's popular essays, which drew forth her opinion upon a question on which she always felt strongly, viz., the proper sphere of women, and of which her whole life gave evidence how qualified she was to speak. After her marriage and the removal of Mr. Gilbert to a pastorate near Sheffield, her mind was characteristically filled with the duties of her new position, and in her letters to her mother she solicits advice, from that competent authority upon "ironing" and "getting-up," the composition of mince-pies and the mystery of puddings for the sick; and her ordinary literary occupations suffered serious eclipse at one time through the superior charms of her baby boy, whose attractions form the burden of innumerable letters to her brother and sister, though she is afraid that Jane and Isaac might find the child troublesome, "yet, I assure you, we can hardly help thinking it exceedingly interesting when he breaks a plate, pulls over the tea-cups, and drags the green cloth with everything upon it off the table." Nevertheless, amid the cares of a

large family, not unvisited by sickness and death, her interest in politics seemed to increase with the requirements of the age. Her philanthropic instincts caused her to take a keen interest in the anti-slavery movement, and she contributed with her pen considerably towards the literature of the question in the newspapers and elsewhere; and a memorial to the Queen, praying for the repeal of the Corn Laws from the women of Nottingham, was drawn up by the same forcible and earnest hand. On this subject she felt strongly, being convinced that bad legislation was at the root of the distress, and that, when the violence of the counter-current may be gathered from the fact that a respectable northern paper spoke of an expected visit of "that Bright" to a northern county, adding that it was to be hoped some stalwart yeoman might be found ready to treat the disaffected vagabond as he deserved. In the potato famine she saw the very finger of God, causing as it did the withdrawal of the Peel Government and the summoning of Lord John Russell to repeal the Corn Laws; and when after all Sir Robert carried the measure, in spite of the unparalleled obloquy with which his own party visited him, she exclaimed: "Oh! brave Sir Robert. How nice to see that a soft potato slung by the hand of Providence has killed the giant." Her enthusiasm for progress, however, stopped short at Women's Rights, about which she wrote a remarkable letter when solicited to join the agitation for the franchise. "My left hand has much to complain of," she says in conclusion thereof—"never either wears a thimble or holds a pen! But I do not find myself injured by this partial arrangement: one has the work and the other the needle, and so I manage between them." With all her love of the picturesque and her intense clinging to old associations, she was never repelled by the prosaic accessories of a useful change. With her large correspondence, it was perhaps natural that she should welcome "the glorious penny post;" but one who was moved to tears by the picturesque associations of the old stage-coach, and who during the happiest days of her life had ridden behind her husband on a pillion among the Lincolnshire fens, must have been severely tried by the introduction of railways. But it was otherwise with her. In the neighbourhood of Nottingham, many acres used to be covered with purple crocuses—a perfect flood of lilac, rivalling, according to William Howitt, whatever has been sung of the fields of Enna. Always on March 20, Mr. Gilbert's birthday, did the two walk down to the crocus meadows, and it may be conceived with what unutterable pain, after he was no more, the devoted wife and sensitive poet saw the crocuses gradually disappearing in enclosures, or the ground being turned up with the spade or harrow. Few could have blamed her if in consequence she had permitted her subjective impressions to colour all her future views on this aspect of modern improvement and progress; yet to her the sod of a sweet pasture turned up by the ruthless navy was a necessary oblation to make room for the great power which, conquering time and space, would weave together

all the peoples of towns and lands, and destroy the long and bitter separation between families. In her seventy-first year she crossed the Border for the first time, arriving at Edinburgh "not a bit tired with our 400 miles' journey, thanks to that blessed Stephenson. How kindly I thought of him all the way, but especially at Newcastle, the cradle of his greatness," adding, however, "Who ever can exist in such a smoke!" She did not prolong her stay there: she had no such severe means of testing a sentiment which she later on, in her eighty-second year, expressed: "There is something almost of poetry to me in a large place of business," and added: "The clatter of a factory has music in it, and suggests, if one but listen with the right ear, not simply pounds, shillings, and pence." This is among the noblest developments of the larger poetic faculty, which, while keenly alive to, and acutely suffering from, the disappearance of conditions which display picturesque aspects, yet, nevertheless, sees beyond them the wiser issues which are involved in their destruction.

We feel that in spite of all we have tried to do, we have lamentably failed in conveying a graphic picture of this remarkable and peculiarly interesting woman, who would, if one felt inclined to classify her, occupy a sort of sphere distinct from both the type of Mrs. Somerville and the ideal wife of the poet, "a creature not too bright and good for human nature's daily food," which it has been wittily observed is, after all, no more than a savage might say of the missionary he was about to eat. It is with regret, too, that we must perforce be brief in speaking of Isaac Taylor, not the least remarkable of the family group, whose drawings, for their original power, drew forth the praise of William Haydon, and who contended with Sir William Hamilton for the Chair of Logic and Metaphysics at Edinburgh in 1836, which he lost by three votes. It was characteristic of the generosity and humility which was common to the whole family, that he always considered his rejection in favour of so distinguished an opponent fortunate for both the University and himself. As an author, too, he was likewise famous in his day; but we forbear to quote his works, fearing they will not convey much impression to an oblivious generation. And indeed, in the eyes of many, the interest of this memoir itself may possibly be impaired by the contrary assumption of the editor in speaking of the lions of the time he deals with. One requires to refer to Mrs. Gilbert's own writings to justify her natural pride that an article by Dr. Olinthus Gregory had been put aside for one of her own, or realise, with regard to those particular persons, the enthusiasm awakened in her girlish heart by a personal introduction to Joanna Baillie, Dr. Aiken, and Mrs. Barbauld. Hannah More, William Haydon, and Kirke White are ghosts of the past; and even Sir Robert Peel, in spite of his recent biography, is to the present generation little more than a sort of spirit of conscience made colossal through the mirage of time. But the tender womanliness, the wide intelligence, and intuitive sympathies of Mrs. Gilbert, and the energy, affection, and fidelity of the family group of which she was one of the

central figures, are of no time, but are part and parcel of the happier inheritance of humanity. No one will deny to the compiler a right to the pride with which he regards his relations, or fail to feel, after reading his book, that the sod covers few hearts more tender and true than those where, to quote his own words, across the sweet valley of the Roding, the bells of Stanford and Navestock "answer each other through the mist."

FRANCES M. CHARLTON.

Essays, Political, Social, and Religious. By R. Congreve. (London: Longmans & Co., 1874.)

THIS volume is apparently intended to be in some sort a public manifesto of Positivism, for it is a republication, with some few exceptions, of all the utterances, public and semi-public, which have been delivered during the past eighteen years by Mr. Congreve, who is the acknowledged leader of Comte's complete disciples in this country. Most of the contents have been already published as occasional pamphlets, and when they appeared received the least possible amount of public attention; so that Mr. Congreve has done well to collect them in this permanent shape, by which he secures a larger audience and also proclaims the common aim which has animated all his writings. They may be most properly classified, not so much by their subject matter as by the different audiences for whom they were originally intended: and thus the book will divide itself into two parts, the one containing appeals to the general public advocating the political and social doctrines of Comte, and the other sermons addressed to an inner circle of professed adherents touching the development of the religion which Comte founded.

To commence with that department of politics to which the followers of Comte in this country have especially devoted themselves, as affording them the most appropriate field for influencing the public mind. By far the greater number of the popular essays in this volume are concerned with International Policy, including under that term the relations of England with all other peoples in Europe and elsewhere who do not form a permanent and integral part of her own community. In his treatment of this subject Mr. Congreve does not confine himself to an historical retrospect, wherein the Positivist system is admitted to be very strong, but in direct fulfilment of his "onerous duty as a conscious servant of Humanity," takes up one by one the burning questions of modern politics, and with unbending austerity offers for acceptance or refusal the one practical solution which Positivism dictates. Gibraltar, India, Ireland, and the Ashantee war, are the headings of a class of essays by which the whole may be best judged, for the principles they lay down are typical of the entire system, and the line of conduct which they recommend is most opposed to the cherished sentiments of ordinary Englishmen. The whole of the Positivist doctrine on this subject may be summed up in a moral duty based upon an historical theory; of which neither the one nor the other ought to sound strange to

English ears, but yet they have met with scarcely any favour outside the body of strict Positivists. The aid of history is called in to establish as a fundamental conception the existing State system of Europe as an organic whole, depending for its reality upon the close mutual action of its independent members, and standing out in marked contrast against the less civilised nations in Asia, Africa, and elsewhere. Upon this conception, which, if rightly understood, requires for its acceptance the mere recognition of the plainest facts in universal history, is based the scheme of international morality, which in its outline is equally simple. It merely consists in the transference of admitted moral duties from private to public life, so that the states of Europe may be guided in their conduct to one another not by their own fancies of national interest, but by the obligations of universal morality, and thus at harmony within themselves may be strong enough to exercise a joint protectorate over all the less advanced tribes of mankind. Such in their most general form, and divested of a certain amount of peculiar phraseology, are the Positivist principles of international policy, against which little can be alleged, except that their realisation lies rather in the remote than in the immediate future. It is certain that they will favourably bear comparison with any other theory of foreign policy which is popular in this country, and that they present the special merit of comprehending all possible questions of international conduct, for they apply to our relations to our colonies and our dependencies no less than to our equals in Europe. It is Mr. Congreve's special object in the essays referred to above to do his best to hasten on the future, by recommending the immediate adoption of these principles by England, which involves a more thorough reversal of her course of foreign policy than most Englishmen would care to admit. In this continual reference to practical conduct consists the peculiar merit of Mr. Congreve's method. He permits no popular illusions to interfere with the entire appreciation of that which he has to teach. He will not leave his scheme of policy merely in the region of theory, where it is probable that many would approve of it who would not follow it into its applications. He knows that to be successful he must achieve a fundamental revolution in public sentiment, and he will have no half-hearted adherents who shrink from the logical consequences of their admissions. To take the case of Gibraltar, as being perhaps the least involved in its circumstances. Tried by the standard of international morality, our retention of that fortress is utterly unjustifiable. Does it not violate the moral conscience of Europe just as much as the occupation of Venice offended the just desire of the Italians for national unity? Its advantage to England is doubtful, and if its advantage were never so great, ought we to consider anything beyond our clear duty to Spain? These are the sort of questions which Mr. Congreve asks, and presents a plain case, in which there is no alternative but to refute his principles, or to accept his conclusions. To pass to the subject of India, which is somewhat more complicated, Mr.

Congreve's essay on this subject was first published during the sepoy mutiny, on an occasion when it was yet doubtful whether we should be able to reconquer our empire, and when the attention of those at home was more turned to Indian affairs than ever before or since. It is now republished without the slightest alteration at a time when the government is acting not with the severity of an executioner, but with unexampled benevolence, and when the English people are priding themselves on the bounty of their charity, no less than formerly on the justice of their vengeance, but yet this change of circumstance in no wise impairs the permanent value of the principles which it lays down. There were many at that time who thought that an empire that could be maintained only by a cruel use of the sword was not morally defensible, and all doubted whether it was politically safe; but when judged by the broad rules of duty, our position would not be justified, even if we have this year in Bengal saved hundreds of thousands of lives, as it is certainly not rendered thereby one whit the more secure. It is granted on all hands that we cannot look forward to the retention for ever of India as a conquered country; the maxim of "India for the Indians" has been recognised both in royal proclamations, and in the admission of natives to posts of honour and emolument. It is commonly said that our government is a trust, of which the obligations are most onerous, and the advantages very small. No one, however, either in writing or speaking has attempted to define the process by which we are to prepare India for self-government, or to fix the time at which she shall go free. In this, as in so many similar subjects, we are content to drift with circumstances, and to shirk the responsibility of the future, salving our consciences with the fallacious boast that we do not rule India for our own benefit. Here again Mr. Congreve compels us to look our inconsistencies in the face, and if we confess our duty to be our guide, then to follow that guide whithersoever it shall lead. He himself pronounces that we ought to leave India at once, merely waiting long enough to soften the violence of the change. It may be doubted whether he has laid sufficient stress upon the probable consequences that would result to India from such a step; for he passes them over with a few words, and without distinctly indicating their nature. It may be true, as he argues, that the plain moral conclusion overrides all other considerations, and that we are incapacitated owing to our personal interest from judging impartially as to these future contingencies. But yet before the question can be regarded as settled, even in its moral aspect, we are bound to picture to ourselves what the probable condition of that great peninsula would be when we were gone; and this Mr. Congreve absolutely refuses to attempt. This, however, is a small fault, which might be remedied almost by any one tolerably acquainted with the history of India. It is more important to draw attention to the weakest point in Mr. Congreve's treatment of all political questions. He has not taken sufficient pains to place himself in that attitude which would give

most weight to his opinions. He continually appears to dictate rather than to persuade. All his public writings seem to have been published with the object of disburdening his own soul, and not of influencing the minds of others. As a consequence of this, a deep tinge of melancholy pervades the whole, which only does not become despair, because of his absolute confidence in the future victory of his views. To this same cause may be traced his imperfect appreciation of the difficulties which stand in his way. He seems to imagine that the particular duties which he recommends England to perform are more important than the general adoption of his principles. There is a disagreeable bluntness in the directness with which he persistently opposes himself in season and out of season to the national sentiments. In disregard of the Positivist maxim, "inflexible in principle, conciliatory in practice," he presses on the details before the foundations have been sufficiently prepared. For example, during the Mutiny when the lives of hundreds of English families were in jeopardy, he expresses a fervent hope that India may not be reconquered; not considering that, though the occasion was most opportune for a reconsideration of our national obligations, the feelings of an honourable patriotism should at such a crisis be treated with respect, even if they ought not to override the higher duties to humanity. Yet further, supposing that the English had at that time been driven out of India, little would have been gained for the principles which Positivism holds dear. It might have been better both for India and for England, and therefore no cause for regret, but it would not necessarily have contributed towards the introduction of international morality, without which as a deep-seated conviction in the mind of a nation, any isolated event is of little value. The one thing wanted is to convert public opinion by inculcating that foreign policy should not be abandoned to the caprice of professional diplomatists and to the chances of the future, but that it is the duty of every citizen to interest himself in these questions, so that the moral sense of the people at large may rise superior to temporary prejudices, and to the interests of any particular class. Towards this consummation Mr. Congreve's book will no doubt afford much assistance, but it would have done yet more good, if he had been more careful to treat our national weaknesses with consideration.

Those essays in which Mr. Congreve addresses himself to the limited circle of strict Positivists have a peculiar interest for such as have extended their sympathies to the singular religion which Comte founded as his latest creation, but to the general reader, who may not be familiar with that system, they will appear repulsively strange, from their curious admixture of the practical with the visionary, and of Catholic reminiscences with a belief that repudiates God. They place before us as in a picture the actual condition of the Positivist Church, neither exaggerating its strength, nor concealing its failures, and they also reveal the peculiar bent of Mr. Congreve's own character, and the changes which it has undergone. The first two of these writings, to which alone the title of sermon is prefixed, were delivered

in London in the years 1859 and 1860 on the anniversary of Comte's birth, and are intended to inaugurate the English branch of the Church of Humanity; and both in their general aim and in their style they stand in marked contrast to the remainder. It is not only that they are more cheerful and hopeful in their tone, for that might be expected at the first gatherings of newly converted disciples, but they are inspired with genuine eloquence, and couched in conciliatory language. In them Mr. Congreve represents himself not as the authoritative exponent of a small and exclusive sect, but merely as one who, having transferred his zeal from Christianity to that which recommends itself to him as a less inconsistent and more comprehensive faith, desires above everything that other men should share in his own satisfaction of soul. In them too he spares no pains to make Positivism attractive rather than to render it systematic: no appeal to the sentiments is omitted and no aid from the imagination is disregarded: while the whole is hallowed by his ardent devotion to the memory of his dead master, and by the deliberate adoption of phrases which have passed from the Bible and the Liturgy into the common language of the spiritual life. The two essays printed in French, which were delivered as addresses to the French Positivists in Paris mark an intermediate stage; for Mr. Congreve seems to have felt as much at home with his audience as with their language, and in their presence to have freed himself from that overwhelming consciousness of responsibility, which is evidently growing upon him. It must be added also that the Positivist doctrine wears its original French dress with better grace than its adopted English one, and that some of its features which in English offend by their extravagance appear in French but little worse than legitimate figures of speech. With Mr. Congreve especially is this consideration forced upon the reader, for his own English style is not free from the imputation of Gallicism. Indeed the idea forcibly suggests itself that through long pondering over the volumes which contain the beginning and the end of Positivism, he originally thinks in French, and that the somewhat singular French of Comte, and then has to translate his thoughts into his native tongue. This defect of style is particularly apparent in the last portion of this volume, which contains his annual addresses to the Positivist Church for the last six years: and in other respects too this forms the least pleasing part of the book. To these later addresses Mr. Congreve has perhaps justly ceased to give the name of sermons; and in truth, though they are no less concerned with religion than the two earlier ones, they may properly be called lectures following out the system into practical details, and expounding what the conduct of Positivists should be with reference to the political circumstances of the time. It is part of their object also to review year by year the condition of the Positivist Church, to state what progress it may have made, and to remark upon whatever symptoms there may be which show that its influence is spreading. In all

these matters the lecturer fully acts up to the responsible duties he has undertaken, and he has laid down much that is of value, and is unduly neglected by others, both in his general principles and in his occasional suggestions. The essay headed "Education" is more particularly deserving of attention, as being a most thorough and novel contribution to a subject which has of late become the favourite topic of every political charlatan; and in the essay next but one following are to be found some original remarks upon the moral disadvantages that attend the propensity towards emigration, which is at present so much encouraged as the one safety-valve for political discontent. However, despite all their merits, which are many, there is a certain tone pervading this latter division of the essays which it is not agreeable to notice. Mr. Congreve writes as if he were aware that his position is growing daily more isolated, and that the Positivist solution of social questions is making less way in the world than he had once expected. His own character seems to have hardened, and to have become less enthusiastic: and the system which he offers for our acceptance has become more exacting in its details, and is less softened by any condescension to human frailty. The comprehensive and genial charity of the first sermon is in the last lecture changed almost into bitterness. At page 298 we read with reference to Positivist sympathy with earnest Christians:

"We can look on you as unconscious servants of Humanity. We are glad that you should look on us, as I know some have done, as the unconscious servants of Christ."

But in the few last pages of the book:

"The professed servants of Humanity must lead in the struggle to eliminate God; and that this is the essential element in the whole existing perplexity is forcing itself upon all. . . . We must make it necessary for men to take their sides in the fight: openly and avowedly to take service in one or other of the opposing camps, to bring face to face the two beliefs, the belief of the Past, the belief in God, and the belief in the Future, the belief in Humanity, and to choose deliberately between them."

These are the closing words of the last essay in the volume, and deserve quotation, not only from the prominent position they thus occupy, but also as being a strong expression of that tendency in Positivism already commented upon which so greatly weakens its influence for good.

The limits of our space prohibit us from examining at greater length the vast amount of interesting matter which this volume contains: but it has been of deliberate purpose that no allusion has been made either to the sacred objects of the Positivist religion, or to the peculiar forms of its worship. There is much scattered through the book which an uncandid critic might select for ridicule, and no quotations illustrative of this subject could be appreciated apart from their context, nor could they be fairly offered to anyone who has not taken some pains to comprehend the entire system. It only now remains to notice some of the general causes which have retarded the growth of Positivism in this country, and will to a certain extent interfere with the favourable acceptance of Mr. Congreve's work. First of all,

modern science, under the influence of Mr. Darwin and Mr. Spencer, by its hostile declarations, has weakened the scientific foundation of Comte's philosophy. The late downfall of France has produced an unreasonable contempt and antipathy for any social scheme that originates on the other side of the Channel. Material prosperity, that has spread so widely among all classes, has brought with it in company with a political reaction a general indifference to all fundamental forms of spiritual revival, so that the new faiths of Comte and Mazzini are held of less importance than minute questions of merely sectarian interest. But above all these causes, the Positivists themselves, in their premature desire to realise the Utopia which their master conceived, have been their own worst enemies; for by the terrible definiteness of their system they have repelled disciples, who would otherwise have been attracted by the lofty standard of their morality, and the simplicity of their lives.

JAMES S. COTTON.

The University of Cambridge from the Earliest Times to the Royal Injunctions of 1535. By James Bass Mullinger, M.A., St. John's College, Cambridge. (University Press, 1873.)

THE title of Mr. Mullinger's excellent book hardly does justice to the subject as he has treated it. So little is known of Cambridge in the early part of the Middle Ages that he has, as a necessary preliminary to its later history, given us a full account of the system of education as it grew up in Europe gradually, especially at the great mother university of Paris; since the institutions of both Oxford and Cambridge, as well as those of Prague, Vienna, Heidelberg, and Cologne, were modelled on those of their French teachers. We have hitherto had no satisfactory book in English on the subject. The preface to Mr. Anstey's *Munimenta Academica* only contains a slight sketch, and that solely in reference to Oxford. A glance at our author's table of contents will show that he has endeavoured to trace the connexion between the mental culture of the country and its general history, "to point out in how great a degree the universities have influenced the whole thought of the educated classes, and have in turn reflected the political and social changes in progress both at home and abroad."

The University age commences in the twelfth century, up to which time nearly all learning had been the exclusive possession of the Church. The traditions of Roman culture lingered long in Gaul, at Autun, Trèves, Lyons, and Bordeaux; in the works of men like Antonius and Sidonius we can trace the transition into the Barbarian age. This is clearly described in an essay on "Heathen and Christian Culture in Gaul during the fifth and sixth Centuries," in Von Raumer's *Historisches Taschenbuch* for 1869. It was the merit of the great men of the last classical age to have maintained the struggle with barbarism until the barbarians had become partially civilised, and this again was the great service rendered by Charlemagne and Alfred when fresh hordes of heathen tribes renewed the work of destruction.

The dreadful state of society drove men to the monastic system, for in the monastery alone could many of the best men live an honest and true life. The growth of monasticism may almost be taken as an index of the state of society; when such a life becomes again possible in society, monasticism at once tends to decline. The early glories of Ireland may be connected with the fact that her cloisters were places of refuge for many fugitives, and she repaid her debt to Europe by evangelising nearly all England and part of the continent. In the eighth century Northumbria is the main home of European culture under Bede and Alcuin; and Alcuin imparts his knowledge to the Court of Charlemagne. The piety of Gregory the Great is said to have been injurious to the cause of classical learning, and unfortunately Charlemagne's son Louis the Pious, and Alcuin himself, were equally averse to the poetry of their German ancestors. Louis threw his father's collection of the heroic lays into the fire, and we find Alcuin saying, "What has Hiniold (Ingeld) to do with Christ?" (Ep. 81, ed. Jaffé). Alcuin actually mentions, in his *Life of S. Willibrord* (p. 47, Jaffé), King "Ongendos," whom we only know of else from the famous poem of Beowulf, so that he might have preserved for us invaluable materials. Yet Alcuin was perhaps the main author of the educational revival which marks the close of the eighth century. Hitherto the privileges of the monastic schools had been jealously confined by the Benedictines to their own order; they were now thrown open to the secular clergy. A slight element of lay education existed in the Palace School, where Charlemagne himself participated in the instruction given. That instruction was almost entirely founded on the works of five authors—Orosius, Martianus, Boethius, Cassiodorus, and Isidorus—all for the most part compilers from greatly superior Greek and Roman treatises. Orosius had written a sort of Christian school history at the request of S. Augustine; his contemporary Martianus gives a general sketch of the seven liberal arts, which transmitted to the universities of Europe the ancient division of the Trivium and Quadrivium. Cassiodorus wrote a similar manual half a century later, but its meagre remarks on all subjects except logic show how the traditions of pagan culture were dwindling before the combined influences of a narrow theology and barbaric rule. The *Origines* of Isidore, compiled yet half a century later, in the comparatively undisturbed Visigothic kingdom of Spain, is a kind of encyclopaedia of sacred and profane learning, a collection of the fragments of knowledge still discoverable. Boethius wrote for a higher class than the others, for the old Roman patricians, still in large measure heathen, to whom Jupiter Optimus Maximus was still the lord of heaven and earth; and we owe to him the transmission of that element of purely Greek thought which was during seven centuries nearly the sole remaining tradition of the Aristotelian philosophy preserved by Western Europe. Of course the chief writers also knew their Latin poets, and Alcuin gives (p. 128, Jaffé) a curious list of the authors known in the

School of York, fitting their names into his hexameters as he can, e.g.:—

"Quidquid et Althelmus docuit, quid Beda magister,
Quae Victorinus scripsere Boetius atque,
Historici veteres, Pompeius, Plinius, ipse
Acer Aristoteles, rhetor quoque Tullius ingens."

But our concern here is not with what individual writers knew, but with the school teaching of Europe, such as it continued until the rise of the University of Paris. The Cambridge historian, Carter, quotes, without any apparent doubt, a letter from Alcuin to the scholars of Cambridge! but Mr. Mullinger gallantly gives this up, and allows that Ingulphus himself is only an "historical novel," and that we really know next to nothing about Oxford and Cambridge prior to the college era, which begins with Merton (or with William of Durham's foundation of University College) at Oxford in 1264, and with Peterhouse at Cambridge in 1284. He therefore proceeds to give a full account of the progress of education at Paris. And this is right, for the course of study there, the collegiate system, even the regulations of the Sorbonne, were imitated with scrupulous fidelity in England. So much was this acknowledged to be the case, that when Henry VI. set up a new University at Caen, Paris was able to make a strong protest at the Council of Basle against this dangerous rival (Bishop Bekynton's *Correspondence*, pref. p. cx). The English, however, maintained that if Oxford and Cambridge owed their constitution to Paris, the debt had been more than repaid in the teachers whom Paris had received from England.

The monastic and episcopal schools continued to exist long after the rise of the Universities, but they represented only the stationary and traditional element, and therefore naturally declined as the new institutions began to widen the domain of knowledge. In the latter part of the twelfth century there were three great Universities in Europe—Bologna, Paris, and Salerno—the first famous for its Civil Law, the second for Arts and Theology, the third for Medicine. All three grew up naturally; their legal incorporation as Universities followed at a later time. The teaching of Bologna grew up round the Pandects, that of Paris round the *Sentences* of Peter Lombard—as expounded to an audience not composed of the religious orders, and more in sympathy with the secular power than with the Papacy.

In the year 1109 Anselm died, whose works, like the *Proslogium* and the *Cur Deus Homo* created scholastic theology. In that same year William of Champeaux opened a school of logic at Paris, and Abelard was his pupil. Abelard's *Sic et Non* contained a series of quotations from the Fathers on the positive and also on the negative side of many theological questions. Peter Lombard, in his *Book of Sentences*, put forward propositions tending to explain these difficulties either by subtle "distinctions," or by resolving them into a higher unity. His book was not at first favourably received by all; and one of his pupils, John of Cornwall, attacked his views on the "Incarnation" (in the *Eulogium ad Alexandrum Papam III.*), and advocated their condemnation at the Council of Tours, 1163, at

which Becket was present. Still the book made its way, being the first of a long series of attempts to obtain for the doctrines of the Church a scientific system. The name of Aristotle never occurs in the treatise, but before the death of Thomas Aquinas, in 1274, the whole of Aristotle's writings, in versions either from the Greek or the Arabic, became known to Western Europe: one of the former is by John of Basingstoke, two of the latter by Adalard of Bath (who also translated Euclid) and Michael Scot. These translations also awakened the jealousy of the Church, and it was only gradually that the Aristotelian views were incorporated into the scholastic philosophy. The new teaching drew numbers of foreigners to Paris; but one of the usual quarrels between the students and the citizens in 1228, in which Queen Blanche took the side of the latter, caused a general migration—to Rheims, Angers and Orleans. It was at this juncture that Henry III. issued a general invitation to them to come and settle in England. Many settled at Oxford and Cambridge, and it was from these refugees that Matthew Paris heard the whole story. In a writ issued in 1231 for the better regulation of the University, the presence of many students "from beyond the seas" is distinctly adverted to. Another writ provides that every student shall be under the tuition of some Master of Arts, the earliest trace perhaps of any organisation. Henceforward the intercourse with Paris was very close. Some of our most eminent men, such as Giraldus Cambrensis, Robert Grosseteste, Roger Bacon, Stephen Langton, studied at both Oxford and Paris—a custom which lasted down to the time of Wiclif. Similar affrays between town and gown led in England to attempts at founding new universities at Northampton and Stamford, but these attempts at establishing another *studium generale* had little success. Long afterwards we find a Bishop of Durham giving leave of absence to some of his clergy to go and study at any place where there was a *studium generale* (see the *Registrum Palatinum Dunelmense* of Bishop Kellawe, 1311–1316, e.g. p. 155). Hitherto the Dominicans had the lead at Paris, and the Franciscans in England; but the popularity of the mendicant orders waned as rapidly as it rose. Grosseteste, Bishop of Lincoln (Oxford was in the diocese of Lincoln then), and Roger Bacon still looked for reform within those bodies, but in that very generation the change came from without. Statesmen, such as Walter de Merton, began to entertain the idea of establishing colleges in which men might be trained for the service of God in Church and State, and into which no monk or friar was to be admitted. Law and medicine were then professed by the "clergy" as well as theology, and the word, in fact, included all the professional classes. One of the Merton fellows was especially ordered to teach grammar, and it is to be noted that English as well as Latin enters into his province of instruction. Balliol, University, Oriel, Peterhouse (Cambridge) all copied the Merton statutes, Merton having from the first taken a decided lead. Within its walls were trained the minds that chiefly

influenced the thought of the fourteenth century. There Duns Scotus was educated and taught. Thence came William of Occam, the revolutioniser of the philosophy of his age, and the champion of the Civil Power against the Papacy. Richard FitzRalph too was the precursor of Wiclif. With the advance of the century the palm of intellectual superiority had been transferred from Paris to the English Universities, and Oxford now began to supply some of the ablest and most influential teachers at Paris. The spirit of nationality too was becoming strong. In 1348 the University of Prague was founded in connexion with Oxford; in 1365 that of Vienna, "the eldest daughter of Paris." To Paris, therefore, little more than France was now left.

The commencement of the University of Paris, its mental activity under the influence of the Mendicants, and its rapid collegiate growth, are the three cardinal features in its early annals, which Oxford reproduced with singular fidelity. Mr. Mullinger regrets that no equally full sketch can be given of the growth of Cambridge; he therefore fills up the gap by a more detailed account of the early institutions of the place. The hostels (i.e. lodging-houses under a principal) provided for and absorbed the pensioner class in the University. The college was originally composed only of a master, fellows, and sizars. But we can only here refer to our author's detailed analysis of the early statutes, which has an interest even at the present day.

In the remarkable year 1349 the "black death" fell on the Universities with peculiar severity, and to recruit the thinned ranks of the clergy no fewer than three colleges were created at Cambridge, including Trinity Hall in 1350—which, however, was designed only for students of civil and canon law—and in this we trace an echo of the traditions of Avignon, traditions anything but beneficial in a centre of culture of the higher order. And it was against the canonists of Avignon that William of Occam and Marsilius of Padua waged war in the interest of the scholastic philosophy. William and Marsilius were both Franciscans, for the mendicant orders had again obtained influence in the Universities; but the next great leader, Wiclif, though a follower of Occam in matters of ecclesiastical polity and religious belief, was the most formidable opponent of the Franciscans, and instituted his "simple priests" to be an example to the world of evangelism without mendicancy. The systematic opposition to the corruptions of the Church which had begun to manifest itself in Occam, and was carried out by Wiclif, was essentially a university movement. The Universities thus became the strongholds of Wiclifism, and the Bohemian students carried the new doctrines to Prague. But the movement was suppressed in England, and Paris once more took the lead in Europe. Her champion Gerson is the great name in that "Age of Councils," though he failed in his efforts to reform the church, and the enmity of the Papacy led to the creation of new centres of learning. In the thirteenth century only three universities had arisen on the model of that of Paris; the first half of

the fourteenth century witnessed the rise of the same number; the second half seven; but the fifteenth century saw the creation of eighteen. The English "nation" at Paris was known after 1430 as the "German nation," but ten years afterwards no German student remained. During the fifteenth century the English Universities were in a comparatively dead state. Mr. Mullinger here gives a full account of the foundation of King's College and Queens' College, and ends his third chapter with a sketch of the various libraries in the University. Peterhouse then possessed from six to seven hundred distinct treatises. The fourth chapter contains a most interesting account of "Student Life in the Middle Ages," but an abstract of it would take up so much space that we must refer our readers to the book itself. Our difficulty throughout has been to give any adequate account of a book in which so much interesting information is condensed, and we must for the present give up any hope of describing the chapters on "Cambridge at the Revival of Classical Learning," and "Cambridge at the Reformation," though a better account nowhere exists of one of the most eventful periods of our history. The book ends with the Royal Injunctions of 1535, which mark the downfall of scholasticism and the triumph of the new learning. "In each college and hall there shall be two daily public lectures, one of Greek, the other of Latin." "No lectures shall be read upon any of the doctors who have written upon the Master of the Sentences; but all divinity lectures shall be upon the Scriptures." The men, too, of that generation "saw in the foundation of Trinity College the rise of a new conception of college discipline under Protestant auspices, and with the statutes of Elizabeth they saw the constitution of the University assume that form which, with but few modifications, has lasted to our own day. But with these changes we find ourselves in the presence of new characters and new ideas; and the final triumph of the Humanists seems to mark the point at which this volume may most fitly close." "This volume," yes; but we trust that Mr. Mullinger will yet continue his history, and bring it down to our own day. The materials ought to be as ample, and the interest at least as great, for the state of the Universities is in some respects an index of the state of English society.

In the appendix, as if half regretting his mystic ancestors, Mr. Mullinger quotes Lydgate's account of how "Cassibero at Athens schooled in his youth, and brought Anaximander and Anaxagoras to Cambridge," and how Julius Caesar—

"On Cassibelan, after his victory,
Took with him clerks of famous renown
From Cambridge, and led them to Rome town."

C. W. BOASE.

A VERY searching and able review of M. Brachet's *Nouvelle Grammaire Française*, by M. Arsène Darmesteter, appears in the current number of the *Revue Critique*. It is evident that the present edition of the book is not good enough to be translated into English; we must wait for the second edition "en bonne partie refondue," which M. Darmesteter urges M. Brachet to set to work on at once.

Ismailia; A Narrative of the Expedition to Central Africa for the Suppression of the Slave Trade organised by Ismail, Khedive of Egypt. By Sir Samuel White Baker, Pacha, F.R.S. (London: Macmillan & Co., 1874.)

THE news that was published in the *Times* of the 19th instant to the effect that an official notification had been issued at Cairo on December 6, sanctioning the despatch of two expeditions for the exploration of the countries adjacent to the Upper Nile, serves to increase the interest with which the two handsome volumes now before us will be regarded by the public. It certainly seems to us, after a careful perusal of the story therein so modestly told by Sir Samuel Baker, that whatever other results may be claimed as the outcome of his expedition, it can hardly be asserted that, whether as regards the civilisation of Central Africa, the stoppage of the slave trade, or the introduction of a system of regular legitimate commerce, its effects were likely to be otherwise than of an exceedingly evanescent and temporary character. Had they not been persistently and immediately followed up, the incursions of the Christian Pacha and his soldiers, and the severe lessons he taught to the slave traders and native tribes opposed to his authority, would probably in the course of a few years have only been remembered as a bad dream; while the slave trade would have gathered increased vigour from its temporary cessation. The Khedive, however, has not been long in giving the world renewed proofs of his *bona fides* with regard to the extinction of the slave trade on the Upper Nile. Sir Samuel Baker had no sooner returned from his expedition than Colonel Gordon was appointed to succeed him; and now we learn that two more expeditions have already left Cairo for the further exploration of the regions adjacent to the Upper Nile and the African equatorial lakes, while the construction of the Soudan Railway to Khartoum has also been determined on. It is evident, therefore, that the Khedive is really in earnest in his design of annexing and civilising the enormous extent of territory which forms the field of exploration for the various expeditions now employed. In view of the immense interests that will be developed should this enterprise prove successful, it is satisfactory to have so excellent a text-book as the one now before us to which to refer for information as to the procedure of the first organised expedition on a large scale that penetrated into these regions, and from which to deduce the probabilities of the eventual success of the second.

It was in the spring of 1869, during the visit of the Prince of Wales to Egypt, that Sir Samuel Baker was entrusted by the Khedive with a commission to subdue to the Egyptian authority all countries south of Gondokoro; to suppress the slave trade; to introduce a system of regular commerce into Central Africa; to open up to navigation the great lakes of the Equator; and to establish a chain of military stations and commercial depots distant at intervals of three days' march. His commission was to

last for four years, and gave him supreme authority over all the countries belonging to the Nile Basin, south of Gondokoro, which, situated on the Upper Nile, at a distance of 3,000 miles from Cairo, was to be the base of operations. Nothing whatever is said as to the right of the Khedive to confer such authority with reference to tribes and peoples who did not then recognise his rule, and apparently never had done so. It was probably taken for granted that the proposed annexation would be regarded by all concerned as an unqualified boon.

The task confided to Sir Samuel Baker was of sufficiently gigantic proportions to satisfy the ambition of any one man, and from the commencement he did his best to justify the confidence reposed in him. But he soon found that the firman of the Khedive, backed up as it was by what seems to have been an unlimited credit, did not ensure plain sailing when once he was beyond the range of communication with Cairo. An apparently limitless purse enabled him, with the advantage of his former experience, to provide every conceivable article that might possibly be required by the expedition during a four years' absence from civilisation (provision and prevision of which Colonel Gordon's expedition has since reaped the benefits); but after he had called his vast mass of *impedimenta* into existence, and conveyed it safely as far as Khartoum, he was at once met by the question of its transport. This was found to be incapable of solution; and we may at once say that, in our opinion, it eventually proved fatal so far as the great ends of the expedition were concerned. Not that the Egyptian authorities at Khartoum had not the power, if they had had the will, to have all the baggage conveyed as far as Gondokoro, together with the animals necessary for its further transport inland. But, away from Cairo, every one was hostile to the ends of the expedition; the very officers and men composing it had no wish to put down the slave trade, and evinced their sympathies in a very practical manner by themselves purchasing 126 slaves between Khartoum and Gondokoro. The difficulties that Sir Samuel Baker had to contend with were simply tremendous, and everyone who reads this narrative cannot fail to be impressed with admiration and astonishment at the determination and energy that never would acknowledge a defeat.

It was not until the beginning of February, 1870, that he started from Khartoum with 800 troops, but he did not reach Gondokoro until April 15, 1871, by which time two years of his commission had expired. Between Khartoum and Gondokoro there is a distance of 1,400 miles, the principal part of which consisted at that time of a dismal swamp of drift weed and morass, beneath which the river had completely lost itself. Through this the vessels had to be dragged by sheer brute force; no dry land, no clear water was visible anywhere; it seemed as if the region of chaos had been reached where earth and water were mixed up in inextricable confusion; at this dismal and hopeless work, men and officers laboured in a state of absolute despair, not caring to live, and not fearing to die; and after weeks of toil, when open water was at last reached, found that

the actual river had decreased so much that further progress was hopeless, and, indeed, that no start should have been attempted at all at that season of the year. There was nothing for it but to return to the point at which they had first entered the morass—men and officers being in high spirits at the thought that the expedition would now be abandoned. Little did they know their chief. Sir Samuel Baker pitched upon a convenient spot on the west bank of the Nile, which he named Tewfikyah, and there organised an admirable settlement. He released many cargoes of slaves passing up the river, married the females to his black troops (the refinement of the newly liberated negroes rejecting the "brown colour of the Egyptians"), and had the satisfaction of learning that many of them shortly afterwards bolted with their own Government clothes and their husbands' kit as well. He also revisited Khartoum, and became acquainted with the system by which the monopoly of trade in the countries which he was to annex was leased to Arabs, who made it a cloak for the slave trade; and for the first time met Abon Saood, the representative of Sheikh Agád, the principal of these traders. This Abon Saood is the man who appears throughout the rest of the book as Sir Samuel Baker's evil genius. He can find no language too strong in which to expose his persistent villany, and he indicted him personally at Cairo for every species of diabolical treachery, but was not permitted to appear as a witness. This man is now assistant to Colonel Gordon. Sir Samuel Baker naturally feels aggrieved at this, and occasionally expresses his regret that he did not proceed to extreme measures while he had him in his power. We would, however, wish to hear the other side before condemning every one concerned in his recent appointment. It seems to us from the narrative before us, that Abon Saood might well have something to say on his side of the question; and in any case we should remember the old saw that tells us of the advisability of setting a thief to catch a thief. If Abon Saood is purged of his former villainies, his knowledge of everything connected with the slave trade of the Nile must be absolutely invaluable to Colonel Gordon, and he is, in our opinion, quite judicious in employing as a means to success any individual, even if of ever so exceptionally black a character.

The second start for Gondokoro was made in December, at which season the river was very high, and after superhuman difficulties the expedition, which had been considerably reinforced, managed to get through the morass, and eventually reached their base of operations in April, 1871. They had not brought a single transport animal with them, and though from this time the forces of nature ceased to be hostile to them, they had now for a long time to contend with the enmity of man. It was soon apparent that the chiefs and natives in the vicinity of Gondokoro would not be made to understand the advantages of annexation. They refused to enter into any amicable relations with the new comers: declined to sell them either their grain or their cattle; and seemed utterly unimpressed for good by a grand,

and we must think a somewhat premature military ceremony, held for the purpose of officially proclaiming the annexation of the country to Egypt, and saluting the Ottoman flag. Little by little unfriendly feelings grew into open hostility, and "war" was proclaimed against the Baris. It could have but a speedy ending—of course the smaller and better armed and disciplined body of troops were for the time completely successful; and the end of the year 1871 found the expedition firmly established at Gondokoro. The narrative of the stern measures by which the Baris were repressed, and of the active share which the leader of the expedition himself took in teaching them the accuracy of the Snider rifle, is, however, the least pleasant reading in the book; we do not wonder that the wretched natives had some difficulty in distinguishing between the tender mercies of the Christian Pacha and the more intelligible cruelties of the Arab slave trader. The opening of the year 1872 was marked by an incoherent mutiny among all the troops, encouraged by their officers, who said there was no corn, and that the men would starve. Sir Samuel replied by confiscating immense numbers of the Bari storehouses and flooding the camp with grain; at the same time he ordered all sick men to be sent back to Khartoum, and found that during his brief absence the Colonel Raouf Bey had carried out his directions with such hearty good will, that out of a force of 1,200 men 700 had been sent away. To this and to all other instances of bad behaviour on the part of the general body of the troops, Sir Samuel Baker's picked bodyguard, which he named the Forty Thieves, must be noted as forming a marked exception; they were always found to be loyal, courageous, and quite devoted to their leader.

Leaving 300 of his reduced force to garrison Gondokoro, Sir Samuel now started with 200 men to explore and annex the southern districts, taking with him, in boats, the sections of the steamer which he hoped ere long to see floating upon the waters of the Albert Nyanza. Up to the foot of cataracts in N. lat. 4° 38', to which point the Nile is navigable, all went well; there remained but the question of transport for the contents of the vessels overland to the navigable portion of the Nile in N. lat. 3° 32', from whence there was a clear water-way to the lake. There were no camels; the only hope was that the Bari tribe would provide carriers; this they absolutely refused to do, and the difficulty became at once insurmountable. The sections of the steamer with the English engineers were sent back to Gondokoro, and Sir Samuel determined to push on with his wife, remaining English companions, and 212 troops. From this point the record of the journey, with its chequered accompaniments of constant bloodshed and fighting, reads more like the narrative of the adventures of a Vasco di Gama or a Pizarro, than the progress of an Envoy sent solely with the great objects of pacification, civilisation, and annexation. We think, indeed, that it must always remain a matter of opinion whether, under the circumstances, a further advance at this time was not altogether a mistake. It was one thing to have entered the country as a

great and independent Pacha, envoy of a still greater Prince, with a force sufficiently strong to render all hope of resistance impossible, and with a pomp and dignity certain of producing a lasting effect on barbaric minds; another to have to march through it in mortal peril from day to day, dependent on the very natives who were to receive the aegis of the Khedive's protection for the means of transport and support, and with a force sufficiently small to invite constant attack, though always able to ward off such attacks successfully. Sir Samuel Baker, however, did not hesitate for a moment, and in this narrative our readers can learn for themselves how nobly and steadfastly each man of the expedition did his duty, from the time that they first set their faces to the south, to the day when, a greatly diminished number, they re-entered their camp at Fatiko.

It would take too long for us to trace, however briefly, the journey of the expedition to the South. Sir Samuel arrived at Fatiko without difficulty, and after having established the "government" there, started again for Unyoro in March, 1872. He arrived at Masindi, the most southern point reached by the expedition, in N. lat. $1^{\circ} 45'$ at 133 miles from Gondokoro, and was at first hospitably received by the king, Kabba Rega. Suspicious feelings, however, were soon engendered, and eventually broke out into open hostility, and on June 14, 1872, the expedition had to set fire to their camp, fort, and magazines, and retreat in imminent peril to Rionga, a neighbouring chieftain at war with Kabba Rega. The story of their march for eighty miles through grass eight or nine feet high, among which their active enemy lay in constant ambuscades, is unparalleled. But they managed to reach Rionga with the extraordinarily small loss of eight killed and ten wounded. When once they had arrived there, they were in safety, and there we must reluctantly leave them. Sir Samuel himself returned to Fatiko, managed to clear out the slave traders completely from that neighbourhood, established the government there, and eventually returned by Gondokoro to Cairo in the spring of 1873.

His return voyage down the Nile must have given him sad proof how little all his efforts had done to stay the slave traffic: for he passed several dhows with slaves on board, and there was no attempt made at their concealment. One piece of good news he learnt at Khartoum of great importance. Owing to his representations, the Khedive had sent down orders to remove the sudd or obstruction to the navigation of the White Nile, and this was being vigorously proceeded with.

We have endeavoured in the above columns to give the merest outline of this extraordinary narrative. Our readers must, however, study it for themselves; and though in our opinion these two bulky volumes might well have been abridged by half (very many petty and superfluous details being omitted), still they have very much in them that will well repay perusal. The illustrations are full of life and vigour, though they too would have been more valuable had they been sketched from personal observation, instead of, as is often quite evident, from mere *ex post facto* description; and the sporting anecdotes alone, on which we have for-

borne to touch, will have a peculiar charm of their own for many readers.

The appeal which in these volumes Sir Samuel Baker makes to the civilised world as to his conduct of the expedition cannot be answered now. For any correct knowledge of its permanent results we must wait for reports from that officer who has been despatched so speedily to follow in his footsteps. We shall soon know from him how deep are the traces left behind by his predecessor and his companions: whether their advent was really the beginning of a new life for Central Africa; or whether their passage was as that of a boat over the sea. But on one point Sir Samuel Baker may fearlessly challenge the opinion of the world, and may ask with confidence whether the history of English travel affords a more striking instance of what English courage, energy, and dogged determination can achieve, than that which is with such modesty set forth in these delightful pages.

Of Lady Baker we have forborne to speak: not because her influence does not appear in every relation of the scenes described, but because we really do not know how to do her justice. Her name is synonymous, wherever the English language is understood, with a courage and a devotion surpassing that of women; and her self-denying heroism will be a household word wherever the English race and language may spread long after she herself shall have passed away. Most heartily do we echo the sentiment of her Egyptian escort: "May God grant her long life."

EUAN SMITH.

Premiers Lundis. Tome I. Par C. A. Sainte-Beuve. (Paris: Michel Lévy Frères, 1874.)

Premiers Lundis are a collection of the earliest critical work of M. Sainte-Beuve, of the reviews which he contributed to the *Globe* and to other papers. It seems from the statement of the editor, M. Jules Troubat, that M. Sainte-Beuve at first disliked the idea of reprinting these papers, but that on second thoughts he was desirous that they should be collected. His second thoughts were best, for though these essays want the biographical interest of the later *Lundis*—and though several of them are slight reviews of ephemeral books—they show how firm, how acute, and temperate was M. Sainte-Beuve's taste from the very first, and they recall, too, some quaint fragments of literary gossip. It would be well if, now that M. Victor Hugo's poetry has ceased to have the attraction of novelty, his admirers could write of him as dispassionately as M. Sainte-Beuve did in 1827. He was not carried away by the enthusiasm of the Romantic school, any more than he was influenced by the frigid and formal taste of his master, M. Daunou. He observes about Victor Hugo, "Les fautes habituelles sont les fautes de goût, de la trivialité pour du naturel, du précieux pour de la force." And nothing can be more true, no criticism more permanent than this on the same poet:—

"Sensible et ardent comme il est, la vue d'une belle conception le met hors de lui; il s'élance pour la saisir, et s'il ne l'a pas enlevée du premier coup à son gré, il revient sur ses traces, s'agite en

tous sens, et se fatigue longuement autour de la même pensée, comme autour d'une proie qui lui échappe."

Sainte-Beuve is much more sensible to the perilous force than to the sweetness of Hugo:—

"Il vise à la grace et à la simplicité, et il va jusqu'à la mignardise et à la simplissime; il ne cherche que l'héroïque, et il rencontre le gigantesque; s'il tente jamais le gigantesque, il n'évitera pas le puéril."

These are consoling sentences for readers who neither feel a call to be fanatics for Hugo, nor to sneer at him as a *fou furieux*. It must have required all the balance of Sainte-Beuve's mind to venture, in speaking of Hugo in 1827, to praise "the adorable choruses, the quiet, the serenity" of Racine's *Athalie*. When men of letters were divided into *les flamboyants* and *les grisâtres*, Bohemians and periwigs, the critic did not cast in his vote with either.

There is an article on Hoffmann's tales in this volume which expresses with perfect clearness and terseness, as well as with admirable illustration, the limits and nature of the fantastic in art. It is curious to look at a contemporary review of the same writer by Sir Walter Scott, and to admire in how accomplished and certain a style the young critic says what the old poet labours vainly to express. The contrast is very strange and touching. Scott was noting in his diary that his brilliant and sparkling fancies were leaving him, that "the wine is somewhat on the lees, perhaps it was but indifferent cider after all." In his review of Hoffmann it is too plain that his hand is out, that his genius has deserted him, that the right word will not come to him, that he cannot seize and shape his thought.

Well that essay was written in a time of great sorrow, and pain, and poverty, to help a poor brother author. And this, with many such acts, is the answer to M. Sainte-Beuve's attack on Scott's *Life of Napoleon*, as a mercenary work. Scott did compile it for money certainly; it was part of that struggle to pay his creditors, which killed him. But there was nothing sordid in his motives. If he spoke hardly of Napoleon, then Lanfrey more; if he made slips and errors, then M. Thiers not less; if he smiled at Napoleon's eloquence, his taste was at one with the taste of his countrymen; and as for "the strange and grave imputation on General Gourgaud," Scott established it by documents, and was only too anxious to give the General the usual satisfaction. "If a quarrel be fixed on me, Jackie, I will not baulk him," Scott wrote to William Clerk. M. Sainte-Beuve's review of the *Life of Napoleon* is excusably bitter, and he carefully distinguishes between the poet he admires and the historian he disparages. But Goethe praised what Sainte-Beuve despised. Perhaps the most characteristic article in the collection is that in which Sainte-Beuve dwells on the fatal force of the revolutionary fever: "Les forces humaines, égarées de leur sphère, se manifestent sous des formes inaccoutumées, et semblent emprunter aux forces physiques quelques-uns de leurs caractères: comme elles, sourdes, aveugles, inflexibles, accomplissant jusqu'au bout leur loi sans la comprendre." This was

written in answer to a charge of fatalism against M. Thiers, who then as now seems to have been very ready in his acceptance of accomplished facts.

On the whole, the impression left by the book is that Sainte-Beuve's was a calm impartiality, "contemplating all." It would not easily be guessed that he ever lent himself, half as spectator, half as partaker, to any of the ideas and movements of his time. His article on his own poem "Joseph de Lorme," is one of his many little elegies over the poet dead within him. But it might have been written by an onlooker. If Sainte-Beuve, the born sceptic, had any of the bitterness of scepticism, he disguised it wonderfully, at least in his prose.

A. LANG.

CHRISTMAS BOOKS.

A Rare and Choice Collection of Kings and Queens and Other Things. (Chatto & Windus.) It is hard to understand why this book is so gorgeously bound and "imprinted in gold and many colours," unless it is written by royalty or for royalty. As we look through its richly decorated and would-be funny pages, we are reminded of the King in *Alice in Wonderland* who, when his subjects did not appreciate his jokes quickly enough, said that "it was a pun;" and then they all laughed.

Here is a specimen of this "rare collection." "The great Grand Duchess. Born Paradoxically. Died Perpendicularly. It seems under these circumstances almost a pity we have not got her portrait. It is said she was freckled, but her uncle was an ornithologist." Here we are meant to laugh—but we sigh and pass on.

Boys. By Lady Barker. (Routledge & Sons.) No one understands writing for boys better than Lady Barker. To prove this we have only to catch any schoolboy of our acquaintance in a lazy mood, and read him a chapter out of this book. A subdued chuckle will be the running accompaniment of the story, and will every now and then break out into a hearty laugh, showing how completely the boy feels that the writer is in sympathy with him, and how surprised he is that a woman can know so much about him. The book consists of short stories about different types of boys. The Emigrant Boy, the Soldier Boy, and the Invalid Boy, are three of the best chapters, but all the twelve are worth reading.

Here is a quotation which shows the spirit in which the book is written:—

"If I could make a model boy, I'll tell you what he should be like. He should love cold water, and hate a lie. He should be frank and unsuspicious as becomes a noble trusting nature, and yet he should be neither silly nor soft; he should have plenty of manias, for I do not believe in a boy who does not go heart and soul into whatever he fancies for the time being. These manias might be for anything out of doors that he liked, from bird-nesting and butterfly hunting up to carpentering and canoeing. He shouldn't be a dunce, though—not a bit of it. We have got rid of a good many stupid old ideas, among them that it is impossible for a man to be a sap and not a muff. Some of the most promising cricketers, the straightest cross-country riders, and stoutest oarsmen I know, have come out uncommonly well at these stiff examinations. Well, my boy should have an appetite like a wolf, for I should like him to be tall and strong, but he must not be a bit greedy. He should not be ashamed of loving and reverencing all that is good and holy and pure, but with nothing of the molly-coddle about him. He should have a fine sweet temper. Yet he should be, as the American song says, 'an orkerd man in a row,' and he should know how to take care of himself with his fists. I think I would rather he did not play practical jokes."

¶ *From Nowhere to the North Pole: A Non's Arkæological Narrative.* By Tom Hood. 11.

illustrated by W. Brunton and E. C. Barnes. (Chatto & Windus.) This is a book of really clever fun. A little boy called Frank goes to sleep in the act of arranging the animals belonging to a Noah's ark. His dreams are haunted by these animals, and he has many wonderful adventures with them, until he is at last rescued from a monster at the North Pole by Noah, who came in his ark and carried him off. The story of the "Latest Invention for Writing Poetry by Machinery" is one of the most amusing parts of the book; and the success of Mr. T. Marzials' poems is too well assured for him to mind the allusions in "A Song."

"The inventor led Frank to a large shallow drawer, divided into small compartments. 'In each of these little boxes you will find a number of words rhyming together. You choose what you please, and place them along the edge of the table of this machine,' and he pointed to a machine something like a printing-press. 'Above you will see several large reservoirs. Each is filled with words printed on small pieces of wood, just like these rhymes. Each contains words suited for the different styles of measures you have to choose from; when you have fixed on the style, you connect the feeder of its reservoir with the machine by pulling out this damper.' The machine is then set going, and the result is a poem." Frank, after several failures, produces the following:—

A Song.

"Merrily roundelay happiness blue
Sicily popular meet tumtiddy,
Poppingjay calendar fiddle-strings grew
Capering mulberry feet tumtiddy."

"'Now,' said the inventor, 'observe the ingenious system of double-feeding. You see the word "tumptiddy" which is mere nonsense, and therefore easily distinguishable from the rest of the words. That is supplied by the second feeder, which is turned on by a small pin in the wheel, which at the same time applies a break to the other feeder. When all is done you have only to remove the "tumptiddies," thus—and there is the poem.'"

The pictures are a series of cleverly-conceived nightmares.

Little Wide-Awake. By Mrs. Sale Barker. With 400 pictures. (Routledge.) This is a pretty book, full of pictures and stories for very little children.

With a Stout Heart is a boy's book by the same author. It is too sensational and crowded with violent incident to be a useful present for boys, but the Indian life and shooting adventures described in it will ensure it a certain measure of popularity.

Sunday Evenings at Home. By the Rev. H. C. Adams. (Routledge.) This is a well-meaning book, consisting of stories from history for every Sunday in the year. This volume extends from Advent to Ascension. Some of the stories are dull, and some are inappropriate, as, for instance, the story of Mr. Wedderburn walking through a tunnel when two trains were passing, which is supposed to illustrate the words, "Walk as children of light." On the other hand, the trial and death of Socrates are well told in illustration of the Jews' imprecation, "He is a Samaritan, and hath a devil." Also the story of Columbus on the deck of the *Santa Maria*, when mutiny was threatened just before America was discovered, is given in connexion with the words "This is the victory that overcometh the world, even our faith;" but the best story is that of St. Vincent de Paul taking the place of the galley slave at Marseilles, and bearing his punishment instead of him.

What Katy did at Home and at School. By Susan Coolidge. (Warne & Co.) This is an American story for girls. What Katy did at home was chiefly to tumble out of a swing and become an invalid for some years, learning many useful lessons during her long illness. What she did at school mainly consisted in a very fruitless endeavour to suppress that spirit of flirtation which seems such an inherent part of the American schoolgirl's career. The story is a very lively

one, full of fun and childlike life. The first half of the book is better than the second. The little boy's journal is specially charming:—

"March 12.—Have resolved to keep a journal.

"March 19.—Forgot what did. John and me saved our pie to take to schule.

"March 21.—Forgot what did. Gridel cakes for breakfast. Dobby didn't fry enuff.

"March 24.—This is Sunday. Corn befe for dinner. Studied my Bibel lesson. Aunt Issy said I was greedy. Have resolved not to think so much about things to etc. Wish I was a better boy. Nothing pertikler for tea.

"March 25.—Forgot what did.

"March 27.—Forgot what did.

"March 29.—Played.

"March 31.—Forgot what did.

"April 1.—Have dissided not to keep a journal enny more."

Andrew Marvell and his Friends: A Story of the Siege of Hull. By Marie Hall. (James Clarke & Co.) We do not know whether there is any historical foundation for the romance which is connected with Andrew Marvell's life in this book; but we think the name ought to have been "Andrew Marvell and his Enemies," for never was any man worse used. His story is the same as that in the ballad of "Auld Robin Gray." He is engaged to Alice, daughter of Colonel Lister, of Hull, and goes abroad. The news of his death at sea is brought to his betrothed, and her father in dying implores her to marry Sir Ralph Hildyard, a gallant and apparently honourable man. Alice is perfectly reckless in her great sorrow, and promises to fulfil her father's wish in six months. Before the end of that time Ralph learns that Andrew Marvell is alive, but leaves Alice in ignorance of the fact, and persists in marrying her. Andrew and Alice never see each other again until after the Restoration, when they meet at Whitehall at the King's birthday party. The writer has hardly dwelt enough upon the brilliant wit or the lofty morality and integrity of Marvell's character; he is represented too much as the man of letters, and the poet.

"Annihilating all that's made

To a green thought in a green shade."

It also seems unnatural that Alice should ever have forgiven her husband when she found out how grossly he had deceived her; but the story, as a whole, is interesting and picturesque. We must notice, in passing, that Andrew Marvell is not likely to have attributed to Marlowe the lines—

"If she be not so to me,

What care I how kind she be?"—

which, if he knew them at all, he would have known were written by his contemporary, George Wither.

What might have been Expected. By Frank Stockton. (Routledge.) This is a most original American story. Two children undertake to keep an old negro woman out of the alms-house by their own exertions. If the book had been written in England, "what might have been expected" would have been that they would get tired of their good work and fail in it. But with American children the case is different. They collected sumac leaves, shot game, and finally started a telegraph company and fulfilled their mission. The story is full of interest and of fun, and the humorous side of negro character is admirably shown. As soon as Aunt Matilda learns the benevolent intentions of Harry and Kate, she exhibits the most amusing combination of gratitude, suspicion, and cunning; and they have hard work to keep themselves from supporting a whole colony of her friends in addition to herself. The scene in which little Kate tries to make up her mind to shoot a hare for Aunt Matilda's benefit, and fails from pity, is delightful; and ends naively with the reproof of the old negro Uncle Braddock: "All right, Miss Kate, that may be a werry pious way to go a huntin, but it won't bring you in much meat."

F. M. OWEN.

NOTES AND NEWS.

A VERY interesting document was presented by Dr. Diamond to the Royal Society at their last meeting, viz., the Original Memorial from the President and Council of the Royal Society to George III., praying that observers might be sent out to observe the Transit of Venus in 1769. Among the signatures are those of Lord Morton, Nevil Maskelyne, Gowin Knight, and B. Franklin.

THE Early English Text and Ballad Societies' books now in the press for 1874 cannot be finished this year, but they will be issued in January, 1875. A large Part II. of Dr. Morris's edition of the *Cursor Mundi* is now ready as the first volume of the Early English Text Society for the new year.

THE publications of the English Dialect Society for 1873 and 1874 are at last all but completed. Of the six publications for the two years, No. 1 was sent round to members last March. Nos. 3 and 4 have been sent round during the past week; and Nos. 2, 5 and 6 will be sent in January, 1875, accompanied by the Annual Report for 1874.

In addition to the above (by an arrangement made with the publisher, and with the author's permission), a copy of the Rev. W. D. Parish's *Glossary of the Sussex Dialect* will be sent to every member of the English Dialect Society who has paid his subscription for 1874.

The year 1875 will be left clear for the immediate commencement of the publications for that year. Indeed, some contributions by Mr. Atkinson, the author of the *Cleveland Glossary*, are already in type. Mr. F. K. Robinson, of Whitby, has nearly completed his extensive glossary of words in use at Whitby, which will shortly be sent to press. For the rest, the success of the Society is now assured, as more material has been already promised than can be printed in the next three years.

THE College for Men and Women in Queen Square, Bloomsbury (expanded from the Working Women's College), has proved a great success. It has over 450 students, of whom above sixty are men. The classes have been well attended, the lectures too, the reading and coffee rooms well filled; and the kindly feeling prevalent among the students and between them and their teachers is evident even to the casual visitor. Mrs. Malleson and her friends are to be congratulated on the success of their liberal enterprise. We hope soon to hear of the College taking premises double or treble the size of their present ones.

MR. FURNIVALL is to give a course of six lectures on the Literature of the Elizabethan Period to the Bedford Ladies' Association in February and March of the new year.

MR. HORACE HOWARD FURNES has presented his Variorum editions of *Romeo and Juliet* and *Macbeth* to the Sunday Shakspeare Society; and Mrs. Furness has also given the Society her *Concordance to the Minor Poems of Shakspeare*.

THE *Revista Europea* for this month has an article on Signor Girolamo Picchioni, an Italian philologist of some note, who died last year in Milan, where he filled the chair of Professor of Greek Literature. Exiled for political causes for twenty-nine years, he had passed the years between 1840 and 1848 as Italian master at Eton, under Dr. Hawtrey. Some quotations from his account of Eton are interesting, as showing an Italian's view of our public school education. Signor Picchioni is a great admirer of Eton. The excellence of the masters struck him very much, and he thinks it due to their high social position, and to their security from all anxiety, and freedom from the interference of ministers and the change of educational regulations. Signor Picchioni's enthusiasm, however, is rather high pitched, or a change for the worse has lately come over our schoolmasters; for he says that it was the custom of the masters to meet once a month under the head master, and after

discussing school matters each master produced some original work, either in print or in manuscript, as a sign that he was not growing rusty, but occupied himself continually with new studies. We should like to hear of the revival of this custom. Signor Picchioni was much struck with English scholarship, and defends classical education in Italy from utilitarian objections by referring to the example of England. To the study of the Greek and Latin authors he attributes not only the excellence of English orators and writers, but their political moderation. To show the superiority of classical knowledge in England, he tells an anecdote of Ugo Foscolo in 1822, who, having been esteemed a good Greek scholar in Italy, found on coming to England that he must begin afresh with the Greek grammar.

WE take from the *Revista Europea* the following notices of Italian literature:—Signor G. C. Sansoni has published a lecture delivered before the Philological Society of Florence, called "I Precursori di Dante" (Florence, 1874); in which he treats of the contemplative, political and poetic visions of writers before Dante's time, which may have influenced the *Divina Commedia*. The first volume has appeared of a complete translation of Shakspeare's works, with notes by Signor G. Carcano (Milano: Ulrico Hoepli), who has already published separate translations of several of Shakspeare's plays, which have been received with great praise. The present work is to consist of ten volumes, with illustrations. There is no good complete Italian translation of Shakspeare, and this bids fair to supply a want in Italian literature.

SIGNOR ATTILIO HORTIS has published a descriptive catalogue of the works of Petrarch existing in the library called the *Petrarchesca Rossettiana* at Trieste (Trieste). The library contains 416 printed volumes, 30 manuscripts, and a collection of engravings.

SIGNOR BARTOLI has begun a new critical history of Italian literature, the first volume of which, *I Primi due Secoli della Letteratura Italiana* (Milano, Valiardi), has just appeared. The leading characteristic of the book is that the author is not content with stopping at great names, but examines the anonymous popular literature.

THE *Nuova Antologia* notices the appearance at Naples of a new magazine called the *Casanova*, which is to be devoted to questions connected with education.

THE Academy of Inscriptions has elected M. Georges Perrot an honorary member in place of M. Guizot.

THE annual meeting of antiquaries, etc., to celebrate the anniversary of the birth of Winckelmann, took place at Berlin a week or two since. The French papers remark that one of the speakers, in mentioning the works of Raoul Rochette, took occasion to express himself very warmly on the subject of French science—almost the first act of justice, they say, done to the French nation by German subjects since the war.

M. MÉZIÈRES delivered his *discours de réception* before the French Academy on the 17th instant, on succeeding to the chair of M. Saint-Marc Girardin.

AT the two December meetings of the Society for Tartar and Japanese studies, the following papers were read:—by M. Imamura Warau, on the origin of the race now inhabiting Japan; by M. Ogura, on the etymology of the Japanese words borrowed from the Chinese; by M. Marre, on some interesting fragments translated by him from the native chronicles of Malacca. M. Ph. Bury presented with a number of remarkable Japanese paintings some new observations on the plastic arts in Japan; M. Léon Cahun sketched the civilisation of Central Asia in the sixteenth century, and commented on some passages from old Turkish historians relating to the origin of the Turks and Mongols. M. E. Burnouf gave a

summary of the progress of Asiatic studies from Abel de Rémusat to the present time.

THE following Parliamentary Papers have lately been published:—Reports on the Vienna Universal Exhibition of 1873, Part I. (price 5s. 9d.); Fifth Report of the Rivers Pollution Commission on the Pollution arising from Mining Operations and Metal Manufacturers, Vol. I. (price 2s. 8d.); Return (B) on Poor Rates and Pauperism (price 7d.); Copy of Correspondence between Mr. Plimsoll and others with the Board of Trade on the Draught of Water Records (price 10d.); Returns relating to Public Analysts (Ireland), &c.

WE reviewed a few weeks ago *Adonis*, a very short and very beautiful poem by Paludan-Müller. The other great Danish poet, Christian Winther, has just broken his long silence by producing a work, also very short and very pretty. *I Naad-sensaaret* (In the Year of Grace), is in prose, not verse; but as Winther is almost as distinguished a prose-writer as he is a lyricist, this is less a matter of regret. This new book is a tiny love-story, of life in Denmark sixty years ago. There is nothing very unusual in the treatment; those accustomed to Winther's manner will expect to find it sparkling with humour, slightly bizarre in plot, full of exquisite studies from nature, and microscopically true in its descriptions of the phenomena of emotion. To speak adequately of a little perfect work like this in a short notice is impossible; it is like trying to describe the texture and perfume of a flower, or attempting to analyse the pleasure one receives from the sudden flight of a bird through the leaves of a silent wood. Winther is the Wordsworth of Scandinavia; he says, in this last book of his: "I know still where the first wild strawberries are to be found in the spring woods, and the best nuts in September; and I listen to the song of all the birds, and their voices are the familiar voices of old friends." It is much to be able to say that when one has long passed threescore years and ten.

THE German periodical press is commenting upon the marked and extraordinary dearth of readable poetry in the book-shops of Germany at the present time; and it points out how utterly the reading of poetry has passed out of the sphere of men, and is now nearly limited to that of women. The strain and competition of social and political life may perhaps be somewhat answerable for this state of things; but certain it is, that nearly all the extracts and selections from the best works of the poets of Germany are generally floated into publicity under the persuasive titles of "Presents for Ladies," "Mothers' Albums," and "Daughters' Poetical Extracts," showing the character of the readers to whom they address themselves.

THE following little account of an eye-witness of the execution of Lord William Russell seems worth printing. It is to be found in a letter addressed by Sir Charles Lyttleton to Lord Viscount Hatton, governor of Guernsey—a portion of the Hatton collection lately added to the British Museum:—

"London, July 21, '83.

"My Lord,

"I have only time to tell you that my I^d Russell was beheaded this morning. he sayd not much but that he did not design to murder y^e K^t, nor y^e Gov^t, but to keepe out poperie. he sayd the evidence ag^t him was true as to y^e place and company, he was in, but he took that to be but misprision, for w^{ch} he did not ask God or y^e K^t pardon. I saw him die at a distance and he seemd very stout. The Hangman gave him 3 blows besides sawing wth y^e ax before he cut his head off. he came to y^e scaffold in his own coach w^{ch} was not in mourning nor his livery; himself was in black. Doctor Tillotson, Mr Burnet, and y^e sherrife was wth him."

A FEW noteworthy letters, interesting rather as autographs than for any instructive matter to be learned from them, are to be found among recent

acquisitions at the British Museum. Dr. John Donne, the satirical Dean of St. Paul's, writes: "Sept. 17 At my house at Drury house," to Sir Nicolas Carew, Kt., at Beddington, and to the same person is addressed a letter signed "Willm. Camden, Clarenceux," from "Chesil-hurst, this Sunday morning 20 September," mentioning his journey to Canterbury for the funeral of Sir John Blois. The antiquary Browne Willis dates a note "Plough Inne Cary street near Lincolne Inne March 17 1748;" and there is an appeal from Guildford, dated July 11, 1727, signed "Ar. Onslow" to Lady Isham, for support as a candidate for the county of Surrey at the approaching election, the writer of which was shortly afterwards to enter on his long and distinguished career as Speaker of the House of Commons.

AMONG the vast mass of papers and correspondence collected by Carte, and now deposited in the Bodleian Library, are numerous letters addressed to the Duke of Ormonde during the reign of Charles II., by friends whose care it seems to have been to keep him informed of occurrences at the Court, or of the state of parties in Parliament. These letters convey a lively image of the manners and events of the time. Colonel Daniel O'Neill, Colonel Edward Vernon, Colonel Legg, Colonel Cooke, and others detail some of the scandals of the day. Sir Robert Southwell, Sir William Temple, Sir George Lane, and others, apprise him of the political occurrences at Whitehall, or describe practices, designs and intrigues of the parties at Court or in Parliament, from Oxford or Westminster. In a letter of Sir George Lane, dated December 29, 1674, there is an account of the death of Lord Clarendon, at his place of exile in France, of apoplexy,

"the last fit whereof was soe violent. that his tongue being caught between his teeth they pierced it thorough, inso much as when he came to himself, as he did for a while before he died, he could hardly make use of it for sorenesse, whereof he complained very much, but his phisitions kept him in ignorance how it happened, least the knowledge of it should administer discouragement unto him. One passage I have heard is very extraordinary and remarkable, which is that about a month before his death, writeing in his closet, his pen fell suddenly out of his hand, and being in no discomposure at all, endeavouring to resume it, he found himself for a while unable; which they say he reflected upon as an omen of the shortnesse of his life, and therefore from that moment neglected all the concerns of this life, and betook himself to the serious thoughts of that which is eternal."

WE print the following letter as an admirable instance of the delicate manner in which, at the same time, a gift may be conferred and a substantial favour sought after in return:—

"Noble Sir

"I doe not write this to putt you to the trouble of an Answer, because I know yr employments are so great, and weighty; But my wife hath A minde you should tast of a country dish, and therefore presents you with a chine of Porke and A Turkey; I call it A Turkey because it hath no fellow, But it had one, before Reynard surpriz'd her; And therefore wee dare not keepe this any longer, for Feare shee should follow her many Brothers and sisters that have gone before her: I heare Dr Gillingham Prebend of Winsor hath bin dead these five weekes; I once supplied his moneth for him, and the charges attending, But I shall not looke to bee repaid by succeeding him, especially if all bee true that I heare, that there is A mandate lyes ready for the Place;

"I am Sir

"Yr troublesome and much obliged
Servant

"1 Febr. [16]68

"HENRY VINTNER

"For my much honoured and Hon^{ble} friend

Mr Joseph Williamson at Whitehall

"I pray leave these at Ladye Andersons House in the Strand with A parcell."

THE subjoined extracts from an original letter we have seen, written in December, 1752, to "Mr. John Mason, at Peter House, Cambridge," are

not unworthy of notice from a student of social history:—

"With regard to my journey into the North, I never had a pleasanter or more satisfactory one in my life, the company that went along with me being very agreeable, and the inhabitants of the northern parts far exceeding the southern in points of hospitality, simplicity of manners, and most other qualities that a stranger could wish to meet with. The gentry even of the highest rank are plain, familiar, hospitable men, and extremely civil to strangers, and the meaner sort according to their abilities equally the same, but seem rather given to merriment than industry; and though the southern generally boast of exceeding them in points of religion, yet this I dare to affirm that the virtues of the northern further exceed their vices than those of the southern. And this eonimium I can justly add to their honour, which can be attributed but to too few about us, that is, in going from Bradford in Yorkshire till we got thither back again, I did not hear so much as one oath sworn, save by the soldiers in the garrison at Carlisle. I know this account of their simplicity and integrity is far contrary to the common opinion.

"Butter [at Carlisle] seldom is above two-pence per pound, though it sold at Carlisle for 2½d. when I was there, but was reckoned very dear. Salmon abounds in great plenty, there being very large quantities caught in the river Eden, just by the walls of Carlisle, and seldom sells at above 1d. or 1½d. per pound, and often under. Here is greater plenty of coal than in Westmoreland, there being several great coal works in the county, and much more wood both for timber and fuel; but the meaner sort that live within a mile of the coal-pits seldom burn any, but fetch peats (elding as they call them), perhaps two or three miles, and affirm them to be better fuel. Their butter exceeds ours for sweetness, but their cheese is stark naught, chiefly owing to their bad way of making it. The soil in Cumberland being for the most part good pasture land, their cows are larger than ours in Derbyshire and long-horned, much like the breed at Skipton in Craven, Yorkshire, and though they have a great many Scotch cattle, but buy them only to feed, kill, and really their beef exceeds ours both for fatness and sweetness."

NOTES OF TRAVEL.

THE announcement which has appeared in the daily newspapers, to the effect that no civilians will be appointed to the Arctic Expedition, is incorrect. We understand that there will certainly be one scientific civilian in each ship, and each officer will take up some special branch. No pains will be spared to secure all the scientific results of Arctic exploration, and, with the advice of the President of the Royal Society, there can be no doubt that the Admiralty will secure the services of the best men that can be obtained.

THE Royal Society and the Geographical Society have been invited by the Admiralty to submit detailed memoranda on the scientific results to be obtained from Arctic exploration. The councils of both societies have appointed committees to prepare these memoranda, which will doubtless be comprehensive and practical. Too much must not be expected from officers engaged upon so difficult and hazardous a service; but it is most important that a careful scheme for their investigations should be provided, and we may be well assured that all will be done, and done well, that it is in the power of brave Englishmen to achieve.

AFTER the annexation of the Fiji Islands, Commodore Goodenough had a map of Viti Levu, the largest of the group, drawn and lithographed, which will be published in a future number of the *Geographical Magazine*. At his suggestion the Hydrographer has also published a new chart of the Fiji Islands, illustrated at the side by a column showing the outlines of other principal islands and groups, with their areas and populations. The Fiji Islands have an area of 7,400 square miles, and a population of 140,000 souls; as compared with Jamaica having an area of 6,490 square miles and a population of 441,264; Sardinia with 9,547 square miles and 573,115 souls; the Canary Isles with 3,220 square miles and

227,000 souls; and the Sandwich Islands with 8,000 square miles and 64,000 souls.

THE *Basilik*, commanded by Captain John Moresby, R.N., son of the venerable Admiral of the Fleet, has returned to England, after having done much surveying work in Torres Strait and on the coast of New Guinea. The work done in 1872, including the discovery of "China Strait," was fully recorded in the paper by Captain Moresby read before a meeting of the Geographical Society on November 24, 1873. This year Lieutenant L. Dawson was attached to the *Basilik* on special duty as surveyor, and some additional work was done along the north side of New Guinea. Lieutenant Dawson is now engaged in the preparation of the new charts. The first sheet has already been submitted, and the others will follow in a couple of months.

ONE of Lieutenant Cameron's best qualifications as an African traveller is the friendly feeling he always establishes with the people he has intercourse with, whether of Arab or Negro race, owing to his invariable courtesy and tact. With the Arabs of Ujiji he is on the most friendly terms. In one of his recent letters he says:—

"They have noble ideas of their duty towards a guest, although an uninvited one. I have found a way of repaying them by reading Steere's Suahili tales to them, which they enjoy immensely. They have no professional story-teller up here, and are always ready to hear them over and over again."

By the latest date (May 19) Lieutenant Cameron had completed all his preparations at Ujiji, and was to have started for the Lualaba on the next day, May 20.

The journal of Lieutenant Cameron, giving the details of his discovery of the outlet of Lake Tanganyika, has not yet come to hand. The criticism in an occasional note of the *Pall Mall Gazette* on the 18th is therefore premature. The writer of this note characterises Lieutenant Cameron's letter as "vague to a degree." It is brief, because his fuller journal will follow; but it is not vague. It informs us that he has discovered the outlet, has measured the force of its current, and has gone several miles down it. He also gives its position. There is certainly nothing vague in this, and the criticism is unfair; but the *Pall Mall* critic has been still more unfortunate in his onslaught on Lieutenant Cameron's Arab informant, whom he politely designates as a "Father of Lies." This he may be, but certainly not for the reasons adduced by the *Pall Mall* geographer. The Arab appears to have said that he had been down the Lualaba to the sea, and he used the word Congo. His critic asserts that no Arab has ever been on the west coast of Africa south of the equator; never having heard, among others, of the three Arabs who reached Benguela from Zanzibar on April 3, 1852. He caps this blunder by a second, asserting that Congo is a Portuguese name, and that if an Arab had gone down the river he would have said it is called the Zaire. Congo certainly is not a Portuguese name, and Zaire is not the name generally applied to the Congo by the natives except below the falls. We by no means pin our faith on the unsupported statements of Arabs, any more than Lieutenant Cameron is likely to do; but in this case the blunders owe their parentage, not to a dweller on the shores of Lake Tanganyika, but to a would-be geographer much nearer home.

Lieutenant Cameron's arduous undertaking must necessarily be attended with great expense; and we trust that any appeal for funds will be generously responded to. He has already done most important geographical service in exploring the southern half of Lake Tanganyika, and discovering its outlet. He is now believed to be pushing westward with the intention of descending the Congo and reaching the west coast. If he succeeds, it will be the greatest African achievement of this century. If he fails, he will at least have done good geographical

work. Under any circumstances, the expenses must necessarily be very heavy, and must be met by a public subscription. Englishmen, we are convinced, will never allow a countryman engaged in so noble an attempt to be deserted in his need. We understand, and are delighted to announce, that the Council of the Geographical Society has resolved to invite further subscriptions to the Cameron Expedition Fund, and to head the list with 500*l*. We heartily congratulate the Society at having taken the lead, and we cannot doubt that the appeal will be met as it deserves. Such an undertaking as that of Lieut. Cameron is national in its scope, and should have the support of the nation.

A GOVERNMENT mission, having the character of an exploring expedition, was to have left Mandalay for the Chinese province of Yunnan this month. The head of the mission is Colonel Browne, and Mr. Ney Elias, who recently made an important journey across Chinese Tartary, will accompany him. This mission will, it is hoped, have the effect of opening the routes between Burmah and Yunnan, and of developing a trade which was once considerable, but which had dwindled away owing to the Panthay rebellion. The despatch of such an expedition is certainly a step in the right direction.

A REPORT recently sent to the Colonial Office from Labuan gives a curious account of the edible birds' nests, which are included among the "articles imported for the export trade to Singapore." These nests, we are told, are found on the walls of caverns in limestone and sandstone hills all along the coast, but by far the greater part of the supplies received at Labuan are brought from Sandakan Bay and the Kina Batangan River, on the east coast of Borneo. The devourers of these dainties, it seems, distinguish three qualities of them, known as white, red and black. They are produced by two kinds of small swallow; the black nests are by far the most common, and are of much inferior value, one especial drawback being that they are "much mixed with dirt and feathers." Of the finest quality are the white nests, which are without admixture of refuse matter, and of a semi-transparent white substance, resembling isinglass or gelatine. The red nests are of intermediate appearance between the white and black, and are supposed to be made by the bird which constructs the white nests, but at a different season of the year. There is a marked distinction in the price of these delicacies; the white nests sell for 45*s*. the "catty," the red for 20*s*., the black for 4*s*. 2*d*.

Another article of food esteemed by the Chinese as economical and nourishing is the trepang or dried sea-slug, which is collected in abundance amongst the reefs, islands, and bays of the east coast of the Sooloo Seas, and of Palawau.

Pearls are also largely dealt in at Labuan; the smaller kinds are exported to India and China for the purpose, it is said, of being used in medicine and burnt into lime for the Rajahs to chew with their betel and sirih leaf.

THE *Nation* has the following somewhat startling paragraph, announcing the probable emigration *en masse* of the Icelanders to the recently acquired province of Alaska:—

"When Alaska was transferred to the United States the annexation was generally supposed to be for glory and the extension of the national sovereignty, and Mr. Seward was much laughed at for his folly. The speeches delivered, too, over our new Polar acquisition were popularly treated as so much buncombe. It seems, however, that the purchase is very likely to prove a piece of good luck for us, and perhaps in after-ages will redound to the credit of Mr. Seward's statesmanship, as having, at least, annexed more wisely than he knew. The Icelanders, after having lived what, from all accounts, must have been an uncomfortable life in Iceland for a thousand years, are preparing to celebrate their "millennial" period by emigrating *en masse*; and, in looking round over the globe for some place of settlement which shall at once

be habitable, possess a comfortable climate, and at the same time remind them of home, they have hit upon Alaska. Some time since they appointed a commission to visit the country; and the United States, with very thoughtful liberality, lent the commissioners a ship to make the trip in. The *Portsmouth* has just returned, and the commissioners are reported as very much pleased with their visit. They consider the country an improvement on Iceland, and report that it is not only capable of sustaining life, but also profitable industries. The Icelanders are an intelligent and industrious people, who have had centuries of education and civilisation of no mean kind, and probably only need a good country—such as they declare Alaska to be—to enable them to become a creditable addition to the population of the United States. The only opposition to the scheme anticipated is that likely to be made by the trading companies which have monopoly rights."

FOR many years past the wolf has been growing rarer and rarer in Scandinavia, and has practically been confined to the northern uplands of the remoter provinces of Sweden. This winter, however, an inexplicable revival of vitality has taken place among these dangerous brutes. The inhabitants of Lappmark are complaining bitterly of the ravages made upon the reindeer of that province, and *Morgenbladet* announces that a flock of wolves has invaded Norway from the Swedish side, and is at present haunting the woods of Gudbrandsdal. The people of Lappmark complain also that the reindeer are making terrible havoc among the haystacks. It is a curious fact, and one which the Lapps themselves are unable to account for, that in certain years, and often when moss is most abundant, the reindeer take a fancy for hay, and show the most mischievous ingenuity in smelling it out.

NEW YORK LETTER.

New York: Nov. 28, 1874.

A volume entitled *Life and Literature in the Fatherland*, by J. F. Hurst, D.D., has just issued from the press of Scribner, Armstrong and Co., of this city. Dr. Hurst, who is himself an educator, gives in the pleasant pages of his book some very interesting gossip about University life in Germany, the process of book-making, and the pleasures of rambles in the Tyrol.

Biographical sketches appear to be in high favour among our publishers. The *Bric-a-Brac* series, published by Scribner, Armstrong and Co., and edited by Mr. R. H. Stoddard, has just reached its fourth volume, which is composed of selections from the personal reminiscences of Barham, Harness and Hodder. G. P. Putnam's Sons announce a series of volumes of contemporary biography, and Henry Holt and Co. have in preparation a series of biographies which will be also a history of poetry, painting, sculpture, war, and other arts.

Miss Kate Field's *Ten Days in Spain*, which first appeared in the form of letters to the *New York Tribune*, have been collected and published in book form by J. R. Osgood and Co., of Boston. Miss Field is perhaps best known as a correspondent, and the very clever letters which form the contents of this neat little volume will go a great way towards strengthening a reputation which is as pleasant as it is well deserved. Her style is bright and bold; she is quick at observation, and unhesitating with an opinion. The book is dedicated, "in sweet revenge, to 'the Blinker,'" the author's courier through Spain.

Miss Field has just entered upon a career which, although new to her, was followed with honour by her parents. She has now turned to the stage as a profession, although she has no idea of deserting the field of literature. Miss Field made her *début* as Peg Woffington upon the same stage where a week before Miss Cushman bade her farewell. Her audience was composed principally of the *littérateurs* of this city and vicinity, and it is seldom that a more critical assembly has been collected to witness the *début* of an actor. With due allowance for the difficulties of a "first night," Miss Field's effort may be called a success. Her personation was marked by intelligence, vi-

vacity, and an excellent knowledge of stage "business." Rarely has a *débutante* made a better impression upon an audience. Certain critics who measured Miss Field by the standard of an experienced actor and not that of a beginner, were inclined to cavil; but her audience, among which were many members of the theatrical profession, look upon these criticisms as unnecessarily harsh. If she does not at the outset reach the highest rank, she certainly surpasses many of the old and acceptable performers.

Verdi's *Messa da Requiem* has just been sung in this city by the Italian opera company (I believe it has not been heard in London yet), and has met here with general favour. The first quartett of the opera company, excepting Mdlle. Albani, together with a largely-increased orchestra and chorus, under the able leadership of Signor Emanuel Muzio, a nephew of Verdi's, gave the *Messa* at the Academy of Music. To Miss A. L. Cary, the contralto, belong the honours of the performance; not only for her fine voice, but for the intelligence and feeling displayed in the rendering of her part. Verdi is a great favourite with American audiences, but in his *Messa* they looked in vain for that which they love so well in *Il Trovatore* and *La Traviata*. The present work is more suggestive of *Aida* than of any other of its composer's works. It is beautifully melodious and wonderfully original, but shows the influence of the new German school. In his two later works Verdi has evinced a strength and originality for which his enemies had not given him credit.

D. Appleton and Co., of this city, are about to publish a new poem, entitled *The Evangel*, by Dr. A. Coles, author of *Thirteen Translations of the Dies Irae*, *The Microcosm*, &c. Dr. Coles has been engaged upon this work for years, and has devoted the greatest care to its preparation. This volume, the proof-sheets of which I have just glanced over, is, in fact, the Gospel story in verse, and will be profusely illustrated with Albertype reproductions of engravings from Rembrandt, Paul Veronese, Ary Scheffer, Gérôme, Holman Hunt, and others. A good deal of the book seems to me exceedingly uninteresting versification; and the foot-notes swell into the proportions of a commentary; but there are some really noble passages. The Appletons have recently completed arrangements for issuing an American edition of the London *Art Journal*, which will from time to time contain the work of some of the most distinguished American artists.

A series of "Old Letters" will appear in *Scribner's Monthly* for 1875, which should attract some attention in England. They were written by a young American matron—a humble member of that "brilliant galaxy of wits, artists, poets, and statesmen, that, with the aristocracy, made the society of London in the years 1832, 1833, and 1834." Here is a bit from the advance sheets of the January number:—

"Our dinner at the Boddingtons' went off very well. It was a round table. [The guests were Mr. Sharpe, Stuart Newton, the painter; Macaulay, Col. Webster, Mr. Kennedy, Lord Ossulston; a famous beauty, Mrs. Webster; Christopher Hughes; Mrs. Kennedy; Mr. Boddington; his son. Mr. B. was a banker.] Mr. Sharpe is 'Conversation Sharpe'; he was a hatter, but is everywhere sought after on account of his intellect and conversation. He is self-educated, and reads and has read everything. He handed me in to dinner. Macaulay is the young man who is making such a noise in the world—an M.P.—makes famous speeches, and is thought by the Whigs the cleverest man in England. I think he talks too much for so young a man, and he impressed me as a conceited person."

"Rogers sent a little volume of charming engravings to me as a present—illustrations of Sir Walter Scott's novels."

"Friday evening Lady Holland sent her son, Colonel Webster, to call upon us. She is too ill to go out herself. Colonel Webster was the person who first carried the news to Lord Wellington of the approach of the Prussians in the battle of Waterloo, at a ball given by Lady Charlotte Greville. . . . We went

to see old Jekyll, which you would have enjoyed intensely. He is seventy-seven; was the intimate friend of Fox and Pitt, and of George IV., who, he said, 'was the best bad man he ever knew.' He was dressed in blue, with bright buttons buttoned up to his chin, his hair powdered, and his hands entirely misshapen, or, rather, shrunken from the gout; he was looking as delicate and neat as possible. He was seated in a large arm-chair, with books and writing materials, and pictures about him, and antique jars and vases. He has an intimate friend living next door to him. They never meet more than once a year, but correspond twenty times a day and always in Latin. When I went in he held up both hands to welcome me. I drew a chair up to his side and spoke distinctly (for he is deaf), though not loud, as I was requested. He told me Joe had told him I was ugly and stupid, and he saw it was true. He asked if there was 'the same law about beating a wife in America as here;' that he 'understood that we had increased the number of stripes from fifteen to seventeen,' which was dangerous; that the tri-coloured flag was not necessary here, that they were satisfied with black and blue, and that the Union flag was not much in vogue. (A hit at connubial life in London society.) He is a renowned wit, and the brightest old man I ever knew. He said Mirabeau told him that Diderot used to hide himself in his bookseller's store to see who bought his books, and that a person came in and asked if he could buy the prints without the lettered part. He asked if I would let him come and see me (he couldn't walk out), and said that he had learned more of America and American women than he ever knew before."

The musical event of the season was the revival of Wagner's *Lohengrin*, and the first appearance of Mdle. Albani in the rôle of Elsa, which took place at the Academy of Music on the 25th instant. This opera was first given in New York last spring by the Italian Opera company, with Mdme. Nilsson-Rozaud as Elsa, and Signor Campanini in the title rôle. It was not unnatural that we should compare the singers of last Wednesday evening with the artists whom we last heard in the same parts, and we cannot but acknowledge that the former suffered by the comparison. If I had never heard Mdme. Nilsson, I should probably say that Mdle. Albani was a remarkably fine Elsa; but having heard Mdme. Nilsson, who was so much better, I can only say that Mdle. Albani was good—more than good, perhaps. She did not throw into her interpretation of the rôle the poetry for which Mdme. Nilsson's personation was remarkable, neither did her voice fulfil all the requirements of the part. Mdle. Albani's Elsa is a most artistic performance—Mdme. Nilsson's is a unique and wonderful creation. The music of this opera is exceedingly difficult and most trying to the voice. In certain parts—notably the song on the balcony and the duet with Ortrud—Mdle. Albani is unrivalled. She was not, however, equal to the requirements of the prayer-scene in the first act, or the duet with Lohengrin in the third act. This duet takes over twenty minutes in singing, and becomes exceedingly tiresome unless more than well sung. Mdle. Albani's conception of the rôle differs from Mdme. Nilsson's in some important particulars. Taken all in all, however, there is nothing about it with which to find fault, and a great deal in it to praise. Signor Carpi sang the rôle of Lohengrin with taste and expression, but he acted it miserably. Campanini looked every inch the holy knight; there was something inspiring in the very way he walked about the stage. Carpi, as far as bearing goes, might have been one of the chorus. Miss Cary sang Ortrud, and Signor del Puente Frederick, rôles in which they made a most favourable impression last year. The audience at the Academy was the largest of the season. It is very generally regretted that this opera was not given earlier in the season, as the troupe leaves the city on a tour through the eastern and western States on Monday. *Lohengrin* will of course be sung again on its return to New York. The reason for its postponement was, that Mdle. Albani had to learn her rôle in the short time she

has been in America, no small task when taken in connexion with her other professional duties.

Scribner, Armstrong and Co. announce among their holiday books, *Myths of the Rhine*, translated from the French of X. B. Santine by Professor Schéle De Vere, with 150 illustrations by Gustave Doré. This is the first translation made into English of this volume by the author of the famous *Picciola*.

A very readable book of Arctic exploration is Captain Tyson's *Arctic Experiences*, recently published by Harper Brothers. The book is edited by a lady, E. Vale Blake. Captain Tyson belonged to the ill-fated *Polaris* expedition, and this volume gives the results, and holds up to the light the weak points in the expedition. The editor thinks that the *Polaris* expedition was "not a failure, but a grand success," and gives excellent reasons for her opinions. The facts of which the book is made up were given to its editor by Captain Tyson for preparation, and the task has been cleverly accomplished.

CORRESPONDENCE.

TURNER'S LIBER STUDIORUM.

18 Church Row, Hampstead, N.W.: Dec. 19, 1874.

The writer of an Art Note in to-day's *Academy* on the new American Catalogue of *Liber Studiorum* has, I think, omitted to notice how much that compilation owes to the earlier catalogue of *Liber* prints issued by the Burlington Fine Arts Club to its members. Mr. Norton, the American compiler—no doubt a true and excellent enthusiast for Turner—acknowledges, though chiefly in general terms, his own obligations, and indeed most of the "pertinent comments and references" with which your contributor credits him, are due to the writer or writers of the earlier Catalogue.

FREDERICK WEDMORE.

BACTRIAN COINS AND INDIAN DATES.

Kensington: December 16, 1874.

Those of your readers who concern themselves with the vexed question of Indian dates may be interested to learn that evidence of some importance, in that direction, has recently been obtained from the coins of the Bactrian Greeks. Since Bayer's premature attempt to interpret a Mint-monogram on a piece of Eukratides as 108,* Numismatists have not lost sight of the possible discrimination of dates as opposed to Mint-marks on the surfaces of these issues.†

In 1858 I published, in my edition of Prinsep's *Essays on Indian Antiquities*, a notice of the detached letters OF as occurring on a coin of Eukratides (No. 3, p. 184, vol. ii.) and HΓ as found on the money of Heliokles (No. 1, p. 182), which letters would severally represent the figures 73 and 83; but these numbers were apparently too low to afford any satisfactory elucidation in their application as dynastic dates.

On a chance visit to the British Museum, a short time ago, Mr. Percy Gardner was so obliging as to show me all the latest acquisitions of Bactrian coins, and among them a specimen of Heliokles with the full trilateral date, after the manner of the Syrian mints, of ΠΠΓ or 183,‡ which when tested by the Seleucid era (311-183) brings his reign under the convenient date of B.C. 128, and authorises us to use the abbreviated figures, under the same terms, as OF = 73 for 173 Sel. = 138 B.C. for Eukratides, and the repeated ΠΓ = 83 for 183 Sel. = 128 for Heliokles, a date which is further supported by the appearance of the exceptionally combined open monogram [A] (ΠA), or 81 for 181 = 130 B.C. on his other pieces.

In addition to the value of these data as fixing definitively, though within fairly anticipated limits, the epochs of these prominent Bactrian kings, the conventional use of the abbreviated definition introduces us at once to local customs, to which the Greeks so readily lent themselves, in their adoption of the method of reckoning by the Indian *Loka Kāla*,§ which simplified the expression of dates, as we do now, in the civilised year of our Lord, when we write 74 for 1874.

The domestication of the Seleucid era and its incorporation of Indian methods of calculation, leads on to the consideration of how long this exotic system of computation maintained its ground in Upper India, and how much influence it exerted upon the chronological records of succeeding dynasties. I have long been under the impression that this influence was more wide-spread and abiding than my fellow antiquarians have been ready to admit,|| but I am now prepared to carry my inferences into newer channels, and to suggest, as a commencement, that the Indo-Scythian "Kanishka" kings continued to use the Seleucid era, even as they retained the minor sub-

* *Hist. Reg. Græcorum Bactriani*. St. Petersburg, 1738, p. 44.

† H. H. Wilson, *Ariana Antiqua*, pp. 235, 238. General A. Cunningham, *Numismatic Chronicle*, ix. n.s. p. 230.

‡ The unique coin of Plato lately purchased by the British Museum, which is closely associated in its obverse device with the money of Eukratides, is also dated, apparently, PMZ = 147 Sel., or 164 B.C.

§ Albiruni writing in India in 1031 A.D., tells us, "Le vulgaire, dans l'Inde, compte par siècles, et les siècles se placent l'un après l'autre. On appelle cela le Samvatsara du cent. Quand un cent est écoulé, on le laisse et l'on en commence un autre. On appelle cela Loka-kāla, c'est-à-dire compté du peuple." (Reinaud's Translation, *Fragments Arabes*, Paris, 1845.) Albiruni was a great authority on dates, and wrote a book about eras, in which he recounts the existence of an ancient Khārismanian era of 980 years before the Seleucid initial point. (Sir H. Rawlinson, *Quarterly Review*, 1866, p. 491.)

|| J. R. Asiatic Society, xii. 41; J. A. S. Bengal 1855, p. 565, and 1872, p. 175; Prinsep's *Essays*, ii. 86; *Journal Asiatique* 1863, p. 388.

divisions of the Greek months which formed an essential part of its system: and under this view to propose that we should treat the entire range of dates of the "Ilushka, Jushka, and Kanishka" family of the Rāja Taringini,* which their inscriptions expand from ix. to xxviii,† as pertaining to the fourth century of the Seleucid era, an arrangement which will bring them into concert with our reckoning from 2 B.C. to 87 A.D. A scheme which would moreover provide for their full possession of power up to the crucial "Saka" date of 78-79 A.D., and allow for the continuance of certain local reigns as claimed by their subordinate public epigraphs.

The Saka era, with its Indian months as recorded in the Gupta inscriptions,‡ belongs to a new order of things, but this much may be added in conclusion, that the earliest epigraph of Chandragupta, the third of that race, dated in 82 Saka, or 161 A.D., leaves a satisfactory margin for the heroic efforts and successful conquests of the second Vikramāditya (of Albinus's legends) and his immediate successors. EDWARD THOMAS.

TREVANDRUM MAGNETICAL OBSERVATIONS.

4, Abercorn Place, N.W. : Dec. 18, 1874.

In the very favourable notice of my work in your journal of the 12th inst. (p. 639) there occurs the following passage:—

"We miss in the volume any investigations bearing on that most interesting class of magnetic phenomena, magnetic storms, so ably treated of by Sir E. Sabine and the Astronomer Royal, in numerous papers in the *Philosophical Transactions* and elsewhere. Mr. Broun seems to have discussed together the whole of the observations without first separating the disturbed readings from the undisturbed, a course which it appears not improbable may account for some of the differences between his results and those of other magneticians."

Anxious as I am that the amount of work bestowed on these discussions should neither be underestimated nor misunderstood, I trust that I may be excused for offering a few remarks on the passage cited.

Not only has the subject of magnetic disturbances been considered in the discussions of the Trevandrum Observations, but perhaps in no other case have those investigations been carried out to the same extent. In the volume itself the laws of magnetic disturbance usually sought have been treated—the decennial, the annual and diurnal laws of mean disturbance, the diurnal laws of easterly and westerly disturbance, &c., &c. The method by which these results are obtained is not that with which Mr. Whipple is probably most conversant, but it is the same as that previously employed by Dr. Lloyd in his discussion of the Dublin observations, and by myself on the Makerstoun observations. Mr. Whipple's oversight, however, is probably due to the fact that these discussions occupy comparatively few pages of the volume (pp. 141 to 146, and 185 to 189). Besides these investigations, others, never previously tried, were made by me, involving an immense labour: the results, though alluded to, have not been given, since no laws could be deduced from them.

It is, however, particularly the suggestion made by Mr. Whipple, that the separation or non-separation of disturbed from undisturbed observations may explain the differences between my results and those of other investigators which requires notice. It is quite true that no separation of disturbed from undisturbed observations has been made in the discussions given in the volume.

The separation of the so-called disturbed readings from the undisturbed has been strongly ob-

jected to by several magneticians, and the whole question has been thoroughly investigated by me many years ago. The Astronomer Royal has gone so far as to say:—

"I cannot think myself justified in separating any single magnetic indication, or any series of indications defined only by their magnitude; nor do I entertain the belief that any special value could attach to the results which I might derive from observations from which such indications have been removed."

(*Phil. Trans.*, vol. cliii. p. 167.) This is, I believe, the strictly scientific view—one which certainly appears to throw some doubt on the results of the other magneticians referred to. But the fact is, however unscientific the process may be, no separation or exclusion of extreme readings which has been employed, and which leaves a sufficiently large number of observations for discussion, affects the general laws and conclusions sought. I have discussed many years ago the Makerstoun observations of declination (with reference to the lunar action, that which is here most in question), both including all the observations and excluding all those made on days of considerable magnetic irregularity, without altering the general result.

If this be true for a high magnetic latitude like that of Makerstoun, where the effects of the larger disturbances on the magnetic needle (the difference of the directive forces being allowed for), are ten times greater than at Trevandrum,* it will be easily understood that the separation of disturbed and undisturbed readings will have a much less effect at the latter place. This is, however, not a matter of supposition merely, since the method of separation of disturbed days was also employed at Trevandrum on the whole calculations without the general results being at all affected.

The separation then (or non-separation) of the disturbed from the undisturbed readings has nothing whatever to do with the differences referred to; these are really due partly to the particular position of Trevandrum on the magnetic equator (a region of great importance in connexion with the solar as well as the lunar action on the magnetic needle), and partly to the laws having been sought for under conditions and by methods which other investigators have not tried.

JOHN ALLAN BROWN.

AN ALLUSION IN "HAMLET."

3 St. George's Square, N.W. : December 21, 1874.

While congratulating my friend Mr. R. Simpson on his having hit on such an admirable parallel to Hamlet's "croaking raven," which shows too that his father's ghost was then in his mind, I cannot see how Mr. Simpson proves two other points in his letter: 1. "That Hamlet does not quote any passage of the old play of the same name;" for neither Mr. Simpson nor any other known man living has seen the old play. 2. That "the work of commenting should be postponed to the work of gathering materials." In the present case the material was gathered—*The True Tragedie* was printed—in 1844. People have since gone on gathering instead of commenting: hence it has taken thirty years to get these two parallel passages put together in print. Mr. Hickson's and Mr. Spedding's remarkable articles or comments on *The Two Noble Kinsmen* and *Henry VIII.* had been practically overlooked for over twenty years till I had them reprinted for the New Shakspeare Society.† The true moral of these facts seems to me to be, "Comment carefully at once on all freshly gathered material as it comes in. Don't lose

yourself in merely pioneering after fresh material. Use up first what you have in hand." Seeing that Malone's discovery of ryme-tests lay untouched in England for nearly 100 years, that Bathurst's insistence on the value of the stop-line test was pooh-poohed for some twenty years. I think one is now justified in desiring rather study of, and insight into, Shakspeare's plays, his characters and himself, than material for illustrating special passages in him, valuable as that is in its way. I would rather have Mr. Tennyson or Mr. Spedding "comment" on Shakspeare than any other hundred men "gather materials" about him. F. J. FURNIVALL.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Dec. 26,	3 p.m.	Royal Albert Hall: Grand National Concert (Madme. Lemmens-Sherrington).
MONDAY, Dec. 28,	8 p.m. 5 p.m.	London Institution: Professor Armstrong on "The Life-History of Plants and Animals." Actuaries' Institute.
TUESDAY, Dec. 29,	7 p.m. 3 p.m.	Royal Institution: Prof. Gladstone on "The Voltaic Battery: The Cell and its Effects." (Juvenile Lecture).
THURSDAY, Dec. 31,	3 p.m.	Royal Institution: Prof. Gladstone on "The Voltaic Battery: The Replacement of Metals." (Juvenile Lecture).
FRIDAY, JAN. 1, 1875,	8 p.m.	Geologists' Association.

SCIENCE.

The Philosophy of History in France and Germany. By Robert Flint, Professor of Moral Philosophy and Political Economy, University of St. Andrews. (Edinburgh and London: Blackwood & Sons, 1874.)

THIS work is the first tolerably complete account of the attempts which have been made in France and Germany to divine the nature of historical movement, and to formulate its periods and portions in terms of this supposed nature. The speculations themselves are very heterogeneous in character—some of them sketches, some of them systems. Some seek a principle of systematisation and put the gist of the past in the categories supplied by that principle. Others seek the law by which one period or state of society follows another, hoping to foretell the coming times. The first class propose to square the circle; the second, to invent a machine with perpetual motion. The difference of these views points to a deeper division, long maintained as absolute, between the historical and the scientific, or between mind and nature. The present age, however, is, as Professor Flint observes, one in which "all history has been for some time rapidly becoming scientific, and almost all science still more rapidly historical." The fundamental idea of progress or development suggested by history proper, and the fundamental idea of natural law suggested by the observation of physical facts, more and more tend to combine in forming our conceptions of the world. They are not ideas peculiar to the science of history; and to be studied aright must be examined on more comprehensive ground than that of any special science. The distinguishing feature of historical science comes in with the idea of freedom: and the difficult problem is to reconcile this idea with the omnipotence of general law. For

* The greatest deviation of the magnetic needle from its mean position at Trevandrum during eighteen years' observations was only about nine minutes of arc (9'); deviations of twenty times this amount were observed by me at Makerstoun.

† Messrs. Clark and Wright noticed Mr. Spedding's article a few years back.

the science of history assumes that the course of this world is beyond the control of individual agency: that the passions contribute to fulfil the ends of the Spirit, or of Nature, and that the continuous influences of social laws are inevitably, even if gradually, preponderant.

The fact is, that the idea of progress, on which we find some interesting remarks in the "Introduction," is not so simple as it seems. It has both the meaning of development, and of improvement; and while the former sense is tolerably realistic and applies in science generally, the latter contains an idealistic element. Nor is the ambiguity which belongs to this idea less striking in the case of the other idea of unity. The idea of unity, like that of progress, and even more fundamentally, lies at the root of science, or is involved in its very possibility. There is a unity in history in the sense of a solidarity of the human race in all places and times;—in the sense of a continuity in the operation of every force of humanity;—in the sense of a solidarity between all the different forms of human activity;—and in the sense of an unbroken record, where no one point is an absolute end, and no one point an absolute beginning of history. These ideas Professor Flint has in some measure examined: but it would have been well if he had gone more thoroughly into the idea of freedom, which is perhaps more specially interesting to the historical philosopher than either of them. When he remarks that "the present is the necessary product of the past," he may be right, if the past be not understood as the only factor in that product: but when he goes on to say that this view is "compatible with freedom of choice and action," we look for some proof of the statement, and some explanation how this compatibility stands to that held by other thinkers whom he criticises. On these subjects a *quantum sufficit* of metaphysics is a necessary dose for the reasoner who wishes a well-digested doctrine.

There are other points of great importance which Professor Flint has reserved for a future volume. The philosophy of history has yet to be traced as it appears in Italy and England. And the discussion of the character, scope, and method of historical science, its relation to psychology and to theology, its dependence upon the combined and methodical application of all the sciences, as well as questions touching the worth of human life, and the aim and significance of history, remain to be taken up, after the historical theories of the past have been described and criticised. This adjournment, if it be to some degree inevitable, is also to some degree unsatisfactory. The present account seems occasionally like holding a court of justice before the laws constituting its authority have been established.

Professor Flint has brought to the investigation a strong sense, even a fervent zeal, for what is true and right; a vigorous impatience of shams and sophisms of every sort, no matter by whom recommended; and a conviction that the freedom of man must be the keynote to any philosophy of history. The work before us bears ample evidence to the range of his researches and to his power of mastering and repro-

ducing the great systems of historical theory. His exposition is clear and readable, and though often heavy, is relieved by occasional digressions. Its generally lecturesque style refreshes by the directness of personal communication, and may perhaps serve as an excuse for the dogmatic tone of some passages in the book. Still one could wish that decisions were not given *ex cathedra* on many points that are yet considered by tolerably competent critics to admit of a good deal being said on both sides.

In such a work it is difficult to preserve a due proportion. Whilst some of the highest names are also best known, the account of their theory can be safely curtailed; whereas the minor lights call for a good deal of collateral information. This leads without fail to inequality: for although "philosophy advances not by a series only of great steps, but by every labour that extends the limits and increases the wealth of human thought," still great minds perhaps deserve a higher place in that advance than Professor Flint seems disposed to accord them. On the other hand, thanks are due to him for rescuing from comparative oblivion the interesting speculations of Wegelin on historical method, and for explaining at some length the peculiar system of Krause. Even Quinet is not so much read in this country as he ought to be. And if M. Odysse-Barot is not a profound philosopher, his generalisations, beginning with the definition, "*Une nationalité, c'est un bassin*," are at any rate amusing.

The standpoint of the work is professedly scientific and inductive. It holds that "the ultimate and greatest triumph of historical philosophy will really be neither more nor less than the full proof of providence." This proof is to come, not by dragging in religious dogmas, instead of facts of experience, nor by attempting to constrain the phenomena of history in arbitrary categories directly borrowed from the higher logic, but by patiently elaborating facts through the help of ideas, and ideas through the help of facts. On which two remarks suggest themselves: first, a doubt whether the book keeps quite clear of metaphysics and theology; and secondly, that the means at the command of the philosopher seem miserably inadequate to the end and "triumph" suggested.

The theories of which this book gives an account leave various impressions on the mind. At times they dazzle the imagination by their comprehensive schemes, their suggestive analogies, and glimpses of profound unities. But when examination passes from this generality and penetrates deeply at some one point, the charm of the great idea, and its evidence in the phenomena, fade away. Philosophy in their case means, as Kant has said, "not logical exactness in defining notions, or careful distinguishing and verifying of principles, but a far-reaching and flitting glance, a sagacity which is apt in discovering analogies, and an imagination bold in employing them." The philosophy of history has generally taken the motto *Aut Caesar aut nullus*; either all-comprehensive, or unfit to explain anything. In these circumstances the historical enquirer closes his ears to mere reflections and rough generali-

sations, and restricts himself to ground where, if he cannot gain so much, he is certain of what he does gain. He traces the history of a single period, a single nation, a single event, or a special line of human action. And such specialist history has its merits as against vague speculation. But the philosophy of history remains as an end to which all histories yet written are fragmentary contributions—to which all philosophising attempts are approximations, required by the instinct which in different epochs insists on rounding the fragmentary facts. The need of such comprehension is a growing power which strengthens with the widening and increasing complexity of social ties, with the extension of our knowledge of the past and of the various forms of mental manifestation, and with our deepening acquaintance with the conditions of life. Philosophical systems of history, as of other sciences, are but the perpetually recurring anticipations of a finality which we cannot wait for, rendered necessary by the craving of intellect after unity, and having for their aim to bring into a clear light the achievements of the past and the questions of the future. Herein lies at once their weakness, and their strength. They are useful, when by their suggestions they accelerate the consummation of science; injurious when they cramp investigation, or send it upon wrong tracks.

In connexion with the various values of historical philosophy it is well to bear in mind the change in the contents of history itself. From the *naïve* presentation of striking actions, and of marvels in nature and art, it grew to be a record of political movements; and when Christianity entered upon an inheritance of civil power, ecclesiastical interests began to act upon the whole conception of history. The industrial and economical features of society; the influence of arts and sciences; the nature of religion and superstition; the varieties of manners, laws, and languages, have at different times swelled the current of historical narration. And with palaeontology there has been evoked a faint record of things before the point at which history in the older sense began. There is no good ground for supposing that we have yet reached the end. And this growth in the knowledge of what history really means is another aspect of the changes in the philosophies of history themselves.

General and abstract as the results of speculation upon history must often be, they become still more empty and lifeless when summarised. To put them in a nutshell is to make the nutshell scarcely worth the trouble of cracking. The summarising expositor must, to a large extent, erase the background on which the philosophy of history rests.

As the sources from which it draws vary in nature and amount, so does the philosophy vary too. To trace these influences would give meaning and interest to what otherwise seems remote and arbitrary, and, by letting us see the changing element in which the philosophy of history moves, would enable us to judge how far it has in each age advanced. There are occasions when Professor Flint has referred in this way to the environment of the specula-

tive historian; but he has done so too seldom and given too exclusive importance to political considerations.

The subject examined in this volume scarcely carries us more than a century back. It was the central idea of Christianity which, combined with the prophetic vision of empires and with the impression of Roman conquests and perennial sway, first gave a point of vantage from which the kingdoms of this world could be effectively surveyed. Thus arose the view of Augustine in the beginning of the fifth century, with which the view of Bossuet in the seventeenth was substantially the same. A glimpse of a truer method of historical science was gained by the Frenchman Bodin; but it was reserved for the humanitarian and cosmopolitan thinkers of the eighteenth century to initiate, and in large measure to execute, a comprehensive survey of human history.

The list is headed by the comparatively specialist enquiries of Montesquieu on the Spirit of Laws and on the fluctuations in Roman power. But the general aspects of the historical field were more properly exhibited by Turgot and Condorcet. The principal features in the historical philosophy which grew up with the spirit of the Revolution were a hopefulness and enthusiasm, which in many cases continued unabated after many hopes had proved illusory. The favourite theme was the doctrine of universal progress, and of the perfectibility of man. The emancipation which had been won in a few years by the intellectual and social *élite* of France, seemed to promise a speedy realisation of the same freedom of thought and the same extended knowledge for the whole mass of mankind. The charm of new ideas, and of intellectual conquests, made them forget that the bond of custom and nationality was still potent, and that humanity was more than a machine, or even than a vegetable.

The ripe result of the scientific labours of the eighteenth century, as they bear upon humanity, was seen in Herder's *Ideas towards a Philosophy of the History of Mankind*. Natural history, new geographical and ethnological facts, and the study of older civilisations had widened the range of popular conceptions. Goethe's discovery of the intermaxillary bone was not without its effect. Hume's suggestions on Natural Religion, and the educational theory of Rousseau and Basedow, coloured the prevailing tone of thought. Education was the pet project of the day: only the education was to be freed from the schoolmaster's rod, and a royal road was to be discovered for the learner. Pictures and maps and playthings were to lull him unawares in the cradle of science. Culture would have fain been free, but it objected to paying the price of liberation.

The idea of Herder's book is that the end of man's life is a free and fair humanity, and that every country has ample happiness of its own, conditioned by its habits and tradition. Man is a child of the earth, to be explained by his organisation, and by the social strata of custom and language amid which he lives and learns. But after all, this conception of history as education in the open school of nature was almost obliterated by the prominence given to happiness as the

end which was realised by the islanders of the Pacific as well as by the citizens of Berlin. Whilst emphasis was laid on the welfare of men and their equally sufficient development in all lands; the progress of mankind in art and science, which is realised by means of men's instincts and passions was disregarded. But in the contemporaneous suggestions of Kant on a cosmopolitan history the opposite point of view comes forward. Nature according to him is only careful of the kind; and the passions of men and women are a mere play which nature turns to her own end—that end being the full development of reason. Others who have recognised that the individual in this life never attains the full perfection of his nature have sought to complete what was wanting, by supposing, like Leroux, that the soul returns in transmigrations through successive generations on this earth, or like Reynaud, that it rises higher and higher in a series of lives in other worlds than this. But according to Kant, what cannot be accomplished in the individual may be achieved in the race. He supposes the end to be first realised in the State, and most perfectly in a federation of States, by which reason secures a ground of advance in all directions. Hegel attempted to combine this view, that the state is the means of liberating man, and the substratum of all spiritual life, with the view of Herder that each land has a development of its own, or represents the place of the world-spirit at a special epoch. It is, however, in the Commonwealth that moral and intellectual life, as well as art and religion, first reach a real existence; and thus the Commonwealth is the focus of the history of mankind. The several states in their day represent the rounded development of humanity; each good in its kind: but the end is not yet.

The other exponents of historical philosophy at the beginning of this century in Germany call for little notice. Schlegel is the type of a number who were dominated by religious, and in the main Catholic ideas, though none of them possessed the same experience in the facts of history. Schelling made various contributions to historical theory; but his most notable service was rendered in the days of his Nestorhood, when he proposed to define the true time and place of mythology and religion in reference to history.

Since the restoration of the Bourbons in 1815, French theories on history have run in at least three distinct lines. Nearly all of them, with the probable exception of Comte, have been more or less affected by German speculations; and not unfrequently they have caught very distorted glimpses of the doctrine of their masters. It is probable that they have often set forth these ideas with more style than the original thinkers did; but the philosophic value of their utterances is a very different matter. The first of the directions mentioned was that of the Catholic and royalist reaction, preached by De Bonald and De Maistre. The second was the school of Cousin and of Guizot. While the philosopher sought ideas from Germany, the historian got from England the "horribly metaphysical" idea of a constitutional govern-

ment. Cousin's philosophy of history is mainly an exaggeration of some of the more salient features in Hegel, and has little claim to be regarded either as a faithful exposition, or as an independent theory. Thirdly, there was a divergent series of revolutionary thinkers, vigorous, but chaotic. Beginning with the vision of a *carrière physico-politique*, it gave rise finally to the Positive Philosophy. The main achievement of that school is the enforcement of the principles of a science of society, which shall at once consider the organisation of social order, and the method of social progress. Similar attempts to introduce scientific accuracy into social investigations were previously made by Buchez; but even Professor Flint is obliged to confess that Buchez is sometimes too hard for him.

Two of the least satisfactory chapters in the book are those on Comte and on Hegel. And the fault is partly the same in both cases: loose general remarks on the total systems, instead of their special relations to history. In the case of Hegel Professor Flint probably over-estimates the dependence of the Philosophy of History upon the system of the idea. And it was scarcely Hegel's fault that he had not studied Dr. Legge's Chinese Classics.

There are one or two points of lesser importance to which objection might be taken. One is the estimate of war. Professor Flint is scandalised by those who hold that "war is divine in itself, since it is one of the great laws of the world." Exaggeration on these topics is only too easy. Of course war springs from human passions. But the question does not concern these passions—it concerns their place in the economy of nature. The problem really coincides with the much larger issues raised as to the universal competition for existence; and cannot be profitably studied apart from them. It is closely connected with the question of Optimism. Popular optimism means that everything in our immediate surroundings is as good as can be, and that we in particular could not be better off than we are. But philosophical optimism is different from this. The world may be a reasonable world, and yet Number One may not possess all the bliss of which he can form a conception. Professor Flint seems to think that a dash of pessimism is not a bad thing, and that Schopenhauer and Hartmann have added this ingredient to the philosophical cup which their predecessors had made too sweet. This view is at present in fashion: its truth is another matter, not to be found out without much and close examination of both doctrines.

W. WALLACE.

NOTES AND NEWS.

Electrical Excitability of the Cerebral Hemispheres.—H. Braun in a recent number of Eckhard's *Beiträge* gives the results of some experiments he has undertaken with a view of ascertaining the accuracy of Hitzig's statements, some account of which was given in a former number of this journal. He finds, in opposition to Hitzig, that the dura mater is not highly sensitive, even when it has been laid bare for some time. The experiments on the brain were made upon narcotised dogs with feeble induction currents, and were

generally confirmatory of those of Hitzig. A new point, however, was the discovery of two centres in the same hemisphere, the irritation of which called forth similar movements. Thus there were two for the muscles of the neck. On irritation with weak currents, not only did muscular contractions take place during the passage of the current, but often subsequent contractions occurred when the current was broken, and these sometimes spread so that the animal became generally convulsed. In regard to the question as to whether the contraction observed in Hitzig's experiments depends upon the conduction of the current through the tissues to distant parts, Braun shows that section of the fibres springing from the vicinity of the irritated surface stops all manifestation of nervous excitation, the movements suddenly ceasing. So also if the grey matter be sliced away, the application of the electrical current to the cut surface of the whole substance, *i.e.* to the ends of the nerve fibres arising from the cortical substance, the same groups of muscles were thrown into action as when the surface of the grey matter itself was stimulated in this region.

Inoculation with Bee Poison.—Mr. G. Walker, a writer in the *British Bee Journal* (December 1, 1874), opens up the interesting question as to whether immunity from the pain and other injurious effects of the sting of the bee can be obtained by inoculation. Visiting the Hanwell Apiary, he was struck with the mode in which the owner managed his bees, and asked him the length of time it required to render a person sting-proof. The reply was, that the son had only been a short time working with bees, and that he was quite free from any of the usual effects of bee stings. Mr. Walker made the experiment upon himself, his *modus operandi* being to catch a bee, place it upon his wrist, and allow it to sting him, taking care that he received the largest amount of poison, by preventing it from going away at once; then he let the poison-bag work, which it does for some time after being separated from the bee. The first day he stung himself twice. The effect was rather severe cutaneous erysipelas, disorder of the motor nerve, with the usual signs of inflammation. A few days having elapsed, and the symptoms having subsided, he caused himself to be stung again three times in quick succession. The attack of erysipelas was on this occasion not nearly so severe, still a stinging sensation ran up to the shoulder, and a lymphatic gland behind his ear increased considerably in size, the poison being taken up by the lymphatic system. A few days subsequently he was stung thrice, and the pain was considerably less though the swelling was still extensive. At the end of the next week he had had eighteen stings, and by the close of the third week thirty-two stings. After the twentieth sting there was very little swelling or pain, only a slight itching sensation with a small amount of inflammation in the immediate neighbourhood of the part stung, which did not spread farther.

The Dependence of the Perception of Colour upon Time.—In a recent number of Pfüger's *Archiv*, Band ix., and *Medical Record*, November 11, 1874, M. Kunkel describes some experiments made with a view of determining the time requisite for particular colours of the spectrum, especially red, green, and blue, to produce their greatest effect. The following results were obtained:—1. The different parts of the spectrum take different times to produce their maximum of excitation; and in all cases the time taken by red is the shortest, then follow blue and green, of which, with equal subjective brightness, blue has the precedence. Thus, *e.g.*, to produce the maximum excitation (with equal breadth of the slit admitting the light, red required 0.0573 sec.; green 0.0971 sec.; and blue 0.1018 sec. With about equal brightness, the numbers obtained were, for red, 0.0573; for green, 0.133; and for blue, 0.0016.

2. For the same colour it holds good that the

greater brightness takes a shorter time to produce the maximum of excitation than the less. This appears clearly from the following table:—

Colour.	Degrees of brightness.		
	1 sec.	2 sec.	4 sec.
Red . . .	0.071	0.073	—
Green . . .	0.133	0.097	0.0309
Blue . . .	—	0.102	0.0916

3. With the brightness vary also colour-tone and saturation. This fact (the author adds) has already been experimentally proved by Helmholtz, and may be expressed by the statement that with increasing brightness of coloured light the sensations called forth tend towards the white. M. Kunkel observed that blue without change of its colour-tone passes into white, whereas green and red approximate to the white through yellow.

He further observed a marked influence of time on the perception of brightness and of colour-tone. It appeared, especially in the case of green, that the intensities of the coloured light, with short time of action (sufficient to produce maximum excitation), produced uncommonly high values of excitation and an extensive change of colour-tone; whereas the same parts of the spectrum, with the same objective brightness, but with continued looking, excited the eye much less intensely, and thus always made the impression of the colour belonging to that portion of the spectrum with great saturation.

4. With very short action of homogeneous light on the eye the colour-tone is also altered, and in such a way that the whole spectrum now appears divided into two parts, one of which gives the impression of red, the other that of blue. If the excitation be made in still shorter time or with less intensity, we come to a point where there is perception of light but no perception of colour. Only the red end of the spectrum behaved differently to M. Kunkel's eye; here then was always a perception of colour.

Action of Interrupted Currents on Muscle.—In a communication made to the *Archives de Physiologie*, 1874, p. 5, M. Ranvier states that he applied to the semi-tendinosus of the rabbit, which is a red muscle, for the period of one-seventh of a second, an induction current which was interrupted 357 times in the second. The muscle became tetanised, and its curve of contraction, taken by means of a myograph, showed only a single constant elevation. When the same stimulus was applied to the adductor longus muscle of the same animal, which is a white muscle, the curve presented as many crests as there were interruptions to the current. Even when the number of interruptions of the current was reduced to fifty-five in the second, the semi-tendinosus became permanently contracted (tetanus), while the adductor marked each interruption by a distinct contraction. This difference between the two muscles was as equally marked when the excitation was applied indirectly, as when it was applied directly, and it occurred also in curarised muscles. This difference of behaviour appears to result from a difference in the physiological properties of the two muscles. Ranvier has estimated the duration of the latent excitation myographically for the two muscles, and found that in the case of the pale muscle it amounts to one-eighth-third of a second, and for the red muscle one-eighteenth, and is therefore four times longer in the latter.

Phenomena of Life common to Animals and Plants.—Resuming our notice of M. Claude Bernard's lectures reported in the *Revue Scientifique*, we find an elaborate account of the process of development in the fowl's egg, of which we shall only mention a few particulars. The shell of the egg is permeable to air, and the egg respires during incubation, as the adult fowl does. The seed that sprouts and the egg that develops, both take oxygen from the air and give out carbonic acid. As the albumen and yolk matter are modified to form the tissues of the embryo, there is an absorption of oxygen, and a gradual loss of carbon, nitrogen, sulphur, and water, which are

exhaled. Before incubation a certain quantity of sugar is found in all eggs, the mean proportion being 3.70 grammes in 1,000 grammes of egg. The result of a series of observations showed that there was a gradual loss of sugar from the first to the tenth day of hatching, when the quantity was as low as 0.88 per 1,000. It then gradually rose again, till on the nineteenth day it was 2.05 grammes. Here we notice a consumption of sugar corresponding with the growth of the embryo, and likewise a power of forming fresh sugar by what M. Bernard calls the "glycogenic function," which is in operation from the birth to the death of the organism, whether it be animal or vegetable. As sugar is indispensable to the existence of the embryo, it might have been supposed that the egg would contain the quantity required for its evolution; but this would not conform to the physiological law, that the anatomical constituents of an organism compose their own nutriment by synthesis, and decompose it by a process of analysis. It is an error to regard digestion as merely a kind of dissolution which introduces alimentary matters into the blood. There is an active process by which digestible substances are decomposed, and their elements recombined so as to secure the blood being of nearly the same composition in carnivorous and herbivorous animals. With the embryo in the egg the destruction of the sugar may be considered as a result of respiration. M. Bernard regards the saccharine state as the ultimate phase of evolution of all the substances that serve for respiration. Chemists, he says, imagine that amylaceous and hydrocarbonous materials are fit for the combustion of respiration; but physiologists have shown that they pass to the state of glucose before ministering to vital actions. The physiological production of sugar results from the transformation of an amylaceous substance, glycogen, which is converted into sugar by taking up the elements of water—a purely chemical operation, accomplished under the influence of a ferment extensively distributed in the organism, and existing in the blood. Glycogen (closely resembling starch) has not yet been formed by purely chemical means, but is the result of a vital process. M. Bernard gives directions for proving that glycogen exists in egg, and for its examination. At the commencement of incubation, he tells us that if the germinal vesicle is treated with tincture of iodine acidulated with acetic acid, glycogen granulations and cells may be seen under the microscope coloured red. These cells multiply as the development proceeds, and small masses form along the vitelline veins, but not along the arteries. The granules of glycogen are found in the heart of the embryo, and at a later period diffused through all the tissues. As the development of the embryo approaches completion, this diffusion tends to cease, and the glycogen begins to appear in the liver, which, like the other glands, did not at first contain any. When the hatching time comes, the physiological division of labour is complete, and the liver is exclusively charged with the production of the glycogenic matter, which is essential to nutrition. In the embryo the formation of this substance is independent of the nervous system, and in the adult, nerve power is only connected with it through its action on the circulation. After giving many illustrations of the presence of glycogen in various animals, M. Bernard says:—

"If we examine the embryos of very young calves not more than four centimètres long, we may watch the formation of muscular tissue. We see it composed of threads of embryonic cells which exhibit no traces of glycogen. A little later, when the embryo is three or four times as large, the histological elements begin to differentiate, and in the muscular sheath, filled with nuclei, we notice granulations of glycogen, which give the characteristic appearance with acetic acid and iodine."

The glycogen gradually dissolves as the muscular fibre becomes complete, and its striæ appear.

M. Bernard protests strongly against purely chemical theories of nutrition, involving a direct utilisation of aliments, or their modification by processes the French call *dédoublement*, a separation of a complex body into two simpler ones. He contends that by the action of a vital process, the elements of the food substances are separated and rearranged in new forms, so that there is not the distinction that has been supposed between animals and plants, the former being imagined to require complex aliments, and the latter to compound them from inorganic materials. He considers the proof of the opposite theory complete as regards amylaceous substances, and remarks, that although there is more difficulty in tracing similar actions with respect to nitrogenous and fatty matters, he is convinced they follow the same rule. The albumen of the blood, and the albuminoid substances in the tissues are not derived directly from the food, but the stomach probably transforms albumen into peptone—a product ill-determined and little known, but analogous to gelatine—and it is through the action of the organic cells that the albuminous and nitrogenous matters are formed by a fresh synthesis.

M. Bernard proceeds to trace the connexion between "embryonic evolution and reintegrative evolution." The cell and the egg, he observes, are constructed on the same type. The egg divides, segments, and engenders cells in infinite number. These phenomena of proliferation are at a maximum of activity in the embryo, but cell multiplication continues in the adult. In the development of organs their *form* precedes the details of their structure: at first all are similarly composed of embryonic cells. The researches of H. Müller and Rouvier show that neither cells nor tissues are directly transformed into other cells or tissues. When a cartilage, for example, is about to ossify, the cartilage cells disappear; embryonic cells reappear, and it is those that become osseous. The labours of Duhamel and Flourens have shown that a bone is developed at the expense of the internal layer of the periosteum, and M. Ollier has transplanted portions of periosteum with its inner layer of young cells to parts of the body in which there are no bones, and they have grown there and developed bone. Thus the elements of an organism have an individual life, with a certain independence of the position in which they may be placed. But this independence is limited, and in the case of the bone developed from the periosteum in an abnormal position, it is found that absorption occurs, and it disappears. We shall not follow M. Bernard through his exposition of the renewal of limbs, or parts that have been destroyed in animals, nor in a series of protests against dualistic theories that place animals and vegetables in opposition instead of recognising their vital unity. In each living thing, whether plant or animal, may be recognised

"phenomena of combustion, or disorganisation; phenomena of reduction, of synthesis or organisation; cellular or organic energies which control the manifestations. The phenomena of disorganisation, or combustion, are under the empire of physico-chemical forces, for the most part known. The phenomena of synthesis, or organisation, although subject to the general laws of chemistry, require the aid of a living organism, a germ, a cell. A theory of nutrition that does not embrace this side of the question is necessarily false and incomplete."

In another passage M. Bernard remarks that nutrition stops at the close of life, not because aliments are absent, but because the original nutritive impulse handed down from the primordial cell has exhausted its energy.

ONE of the most interesting plants figured in the last number of the *Botanical Magazine* is *Rheum officinale*, the species that furnishes the true medicinal rhubarb. It is called the true species, simply because it possesses the properties upon which the value of the drug depends in a more concentrated degree than any other, not because it is the only

one employed in medicine. But until recently the plant producing the rhubarb of commerce was unknown to botanists. It was obtained by the French missionaries in China, and Dr. Dabry, the French Consul at Hankow, sent plants of it to Paris in 1867. It flowered in 1871, and Baillon published a description of it in the *Adansonia*, vol. x. p. 246.

In the *American Journal of Science and Art* for November, Mr. Armsby gives the results of some experiments on the decay of nitrogenous organic substances. These experiments fully bear out the results obtained by Messrs. Lawes, Gilbert and Pugh (*Phil. Trans.* 1861, ii. p. 501), that during the decay of nitrogenous organic substances in presence of free oxygen, nitrogen may be evolved in large quantities in the free state. The method adopted was to allow organic matter containing a known amount of nitrogen, to decay under such conditions that all the ammonia given off could be collected and estimated, and at the end of the experiment to determine again the nitrogen.

WE have before us a specimen number of a new high-class German weekly paper devoted to the science and practice of agriculture, viticulture, and other branches of rural economy. Its title is *Oesterreichisches Landwirthschaftliches Wochenblatt*, edited by Dr. G. Kraft, assisted by a most formidable array of contributors. Judging from the specimen, it will rank with the best of its class in this country; and it certainly has a wide field of action before it. In the matter of agricultural colleges for the instruction and training of land stewards, foresters, &c., Austria has the advantage of us, but, as observed in the paper in question, the peasant farmers adhere to old customs and routine with the greatest obstinacy; and agriculture in many parts of the wide Empire-Kingdom is still in a very primitive state. Immense areas of land yield nothing, or less than half the crops intelligent management would bring. In original articles there is the first part of an apparently exhaustive history, &c., of the vine pest, *Phylloxera vastatrix*, illustrated by excellent woodcuts.

BARON F. MUELLER, the Government botanist of Victoria, has recently published some contributions to the phytography of the New Hebrides and Loyalty Islands. The enumeration embraces about one hundred species, including a few new ones, and is based upon the collections of a Mr. Campbell. It is perhaps of more importance as suggesting what remains to be done, rather than for the novelty of its contents. A new scitamineous plant, *Guillania noro-ebudica*, is an interesting addition to the flora, but we expected much that was new. The rich and peculiar vegetation of New Caledonia, the Sandwich and Fiji Islands, and other groups partially explored, promises a rich harvest for botanists in those yet unexplored. Now that the Government has finally taken the Fijis under its protection, we may look for further information.

At the opening of the seventh winter session of the Eastbourne Natural History Society, the president, F. C. S. Roper, F.L.S., &c., read his address, and a paper on the Flora of Eastbourne as compared with that of West Kent and West Surrey. This society, although in its infancy, is in a flourishing condition, and numbers several distinguished members. Thanks to the zeal and perseverance of the president, the flora and fauna of the neighbourhood are undergoing strict and systematic investigation. A good rule has been made to include in future publications only such species as have been actually found or seen, and satisfactorily determined by members of the society. It is also proposed to extend the limits of the area under investigation, in order to make it correspond to Mr. Hemsley's Cuckmere district, and thus form a more easily defined contribution to a complete Flora of the county.

WE have received a paper by the Rev. W. Webster, entitled "Sur le Culte anté-chrétien de

la Madeleine à Tardets de Sarrance et de Bétharram," the purport of which is to show that traces of a worship of a Juno Lucina still survive in the Basque country. A Roman altar-inscription found at the chapel of Tardets proves that the site was already a holy one in pre-Christian days; and a genuine phallic-worship may be discovered not only in the conical rock of Sarrance, now dedicated to the Virgin, against which the peasant-women rub themselves in the hope of offspring, but still more in the so-called "Saint of Bidarray." This is a curiously-shaped stalagmite in a grotto near the summit of Mount Artza, which is held in great sanctity and visited by numerous pilgrims. A similar incrustation is found not far off on the Spanish side of the frontier, and goes under the name of "the Son," the one on Mount Artza being termed "the Father."

BASQUE philologists will hear with interest of an important discovery lately made by Mr. W. J. van Eys. The origin and character of the auxiliary verb in Basque has long been a *veata quaestio*, but a small pamphlet which Mr. van Eys has just published, under the name of *Le Verbe auxiliaire Basque*, furnishes a solution of at any rate a part of the problem. A comparison of the Basque dialects makes it clear that the auxiliary which corresponds to "have" is nothing more than the Biscayan *erom*, "to remove," a contracted form of *erazo-joan*, "to make go." The transition of meaning undergone by the verb reminds us of the use of the Italian *andare* in such phrases as *se va dicendo*. In the course of his investigation, Mr. van Eys explains the phonetic changes to which the Basque verb has been subject, and others besides Basque philologists will find material for reflection in the action of phonetic decay thus exemplified in the case of an agglutinative language.

THE first part of Mr. Hershon's *Pentateuch according to the Talmud* (i.e. Genesis), has appeared. It is not a commentary on passages of the Pentateuch, as some readers might imagine from the title of the book, the Talmud being in no sense a commentary on any book of the Bible; the Doctors quote biblical passages either for matter of *Halakiah* or *Agadah*; the collection of those quotations from Genesis is contained in Mr. Hershon's first volume. As for ourselves, we do not consider it of great value either for biblical students or for Rabbinical scholars. The latter miss the quotations from the Talmud of Jerusalem and from all *Midrashim*. As to the passages from the Talmud of Babylon which are contained in Mr. Hershon's book, we must regret that the compiler has simply copied them out of the last edition of Warsaw, which is not one of the best, without consulting the earlier editions of Venice and Amsterdam, and without paying any attention to the *variae lectiones* from the Munich MS. in course of publication by the distinguished Rabbi Raphael Nathan Rabinovitch. We hope that the second and following parts will be more complete, inasmuch as the gaps alluded to above could be filled up without great trouble by following the full indices of Talmudic passages referring to the Bible arranged by R. Aaron Pesaro in his *Toldoth Aaron*, and the supplement *Beth Aaron*, by Aaron ben Samuel; the former is to be found in most of the Rabbinical Bibles.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY (December 7).

SIR SIDNEY SMITH SAUNDERS, C.M.G., President, in the Chair. Lieutenant H. C. Harford, 95th Regiment, Charles C. Dupré, Esq., and Owen Wilson, Esq., were elected members; and Major Greenwood, Esq., a subscriber to the society.

Mr. E. A. Fitch exhibited some Oak Galls formed by insects of the genera *Dryocosmus* and *Aphidothrix*, of which descriptions had been published in a recent number of the *Entomologist's*

Monthly Magazine, together with three curious bud-galls, unknown, from Rayleigh, in Essex.

Mr. Champion exhibited a box of *Hemiptera* collected by Mr. J. J. Walker in different places near the Mediterranean.

Professor Westwood forwarded a letter he had received from Mr. Harris Stone, accompanying a sample of tea imported from Shanghai, infested by a small beetle, which proved to be *Plinus hololeucus*. Also, a letter from Professor Forel, of Lausanne, stating that the *Phylloxera vastatrix* had made its appearance among some vines at Pregny, in the Canton of Geneva, which had been introduced from England into the graperies of the Baron Rothschild, and that the *Phylloxera* had been discovered in two of his greenhouses, among vines planted in 1869, sufficiently distant from each other to render it improbable that the insect could have been communicated one from the other; and he therefore concluded that the disease had been introduced in 1869 from the graperies in England. He was anxious to ascertain whether the vines in the English graperies were less influenced than those out of doors; but none of the members present were aware of the occurrence of the insect out of doors, as it had hitherto appeared in greenhouses only.

Mr. C. O. Waterhouse communicated some "Synonymical Notes on Longicorn Coleoptera."

GEOLOGICAL SOCIETY (Wednesday, December 16).

J. EVANS, Esq., F.R.S., President, in the Chair. In the Arenig and Llandeilo rocks of St. David's, described by Dr. Hicks at the last meeting, large numbers of graptolites have been found; and a collection of these fossils was described on the present occasion by Messrs. Hopkinson and Lapworth. The dendroid forms, which are especially numerous in the Lower Arenig series, were grouped together in a sub-order for which the name *Cladophora* was proposed. Certain changes of nomenclature were suggested, such as that of *Dictyonema* into *Dictyograptus*, and nearly twenty new species were described. Mr. H. F. Blanford, of Calcutta, read a paper "On the Age and Correlations of the Plant-bearing Series of India, and the former Existence of an Indo-Oceanic Continent." Perhaps the best development of this series is to be seen in the Rāniganj coal field, where it attains a thickness of more than 11,000 feet. At the base of the series is the Talchir group, followed by the Barakar beds, which contain a good deal of coal; these are succeeded by certain ironstone-shales, which in turn are overlain by the Rāniganj group, in which coal occurs, with well-preserved plant-remains; above this group are the Panchet beds, containing Labyrinthodonts and *Dicynodon*; whilst the series is completed by what are termed the Upper Sandstones. It appears well established that the upper zones of the plant-bearing series may be referred to the Uppermost Jurassic horizon, but the lower part of the series is by no means easily correlated with other beds of well-defined age; probably, however, it is either Permian or Triassic. It is notable that the base of the series is formed by a conglomerate which exhibits signs of glacial action, thus resembling the Permian breccias with ice-borne blocks described many years ago by Professor Ramsay. Evidence is thus found that glacial conditions must at one time have extended to so low a latitude as within 17° of the equator, and the author entered into a discussion of the probable causes to which glacial epochs were due. Bringing the plant-bearing series of India into correlation with somewhat similar beds in South Africa and Australia, Mr. Blanford argued that it was highly probable that in the Permian period India, Africa, and Australia were connected so as to form a great Indo-Oceanic Continent; and he agreed with Professor Huxley in supposing that the connexion between India and Africa was probably maintained until the Miocene age.

FINE ART.

Joh. Seb. Bach's 'Passionsmusik nach dem Evangelisten Matthäus, mit ausgeführtem Accompagnement bearbeitet. Von Robert Franz. (Leipzig: Breitkopf und Härtel, 1874.)

THE question of additional accompaniments in general, and of to what extent and under what circumstances it is justifiable and even expedient to add to, or in any way modify the works of the great masters, is one which has often been debated, and on which at the present time widely divergent opinions are entertained by musicians. Some maintain that the older masterpieces should, if presented at all, be given precisely as they are written, and look upon the slightest alteration as an impertinence, if not something worse. Others, again, allow themselves to take all kinds of liberties, not only with the dress in which the music is presented, but with the very ideas themselves; while a third class would take as a general axiom that anything is allowable which helps to bring out more clearly the original intentions of the composer, while everything that would deface and disfigure the same must be most carefully avoided. To the first named of these classes, while fully acknowledging the purity of the artistic feelings by which they are prompted, it may be replied that with many of the works of the older masters, especially Handel and Bach, the performance of what is printed in the score is in some cases impossible; and that even where it is practicable it does not and cannot (as will be seen presently) reproduce the full intentions of the author; and that as such music is too precious a legacy to be allowed to remain unheard, some alterations, and, at times, additions, must be made to fit it for performance. To those who would tamper with the text itself, and caricature great masterpieces with their own interpolations, no reply need be given. It would, besides, be useless to argue with them. This kind of "arrangement" is unfortunately only too common; nor are we without instances of it even in this country. The right principle of procedure is undoubtedly to add with discretion where addition is a necessity, while above and before all things respecting the composer's original intentions.

Probably the earliest examples of additional accompaniments are those which Mozart wrote in the last three years of his life to Handel's *Messiah*, *Acis and Galatea*, *Alexander's Feast*, and the *Ode for St. Cecilia's Day*. It should be stated here, for the information of those not familiar with the subject that the necessity for some addition to the scores of Handel and Bach arises from the fact that it was their custom (as it was that of their age), not to write out in full the parts for the organ and harpsichord, but simply to indicate the harmonies by what musicians call a "figured bass." As the composers mostly at the performances played these parts themselves, they would, of course, have no difficulty in supplying the necessary details; and even when they were not personally presiding, the art of playing from a "figured bass" was so general that whoever replaced them would

be able, at least approximately, to fulfil their intentions. But as the modern orchestra developed, and strings and wind acquired greater prominence, the organ and harpsichord were to a great degree supplanted, and the art of which we have spoken fell into desuetude. At the present day it would be a perilous thing to entrust even to a good organist the task of filling up the harmonies extempore in one of Handel's, or still more in one of Bach's scores; and as the effect of a performance of what in many cases would be the mere skeleton of the music, if the organ part or an equivalent for it were altogether left out, would be meagre in the extreme, it is obvious that some course must be taken to fill up in some way or other the often bare outline, if the works are to be made presentable at all. This is the legitimate province of additional accompaniments; the mere increase of noise by the introduction of brass and drums, which are often used, like charity, to cover a multitude of sins, is in the majority of cases only an indication of bad taste. Precisely those musicians whose additions to the original have been most artistic—as, for instance, Ferdinand Hiller and Robert Franz—are also those who are the most sparing of the brass.

Since Mozart set the example, many have, with more or less success, followed in his steps. Of foreign composers Mendelssohn, Mosel, Hiller, and Franz may be named; while in this country Mr. G. A. Macfarren, Mr. Arthur Sullivan, the late George Perry and Vincent Novello, and Sir Michael Costa have all turned their attention to the re-scoring of Handel. Nobody, however, has devoted himself to the task so systematically and one might say "scientifically" as Robert Franz; and as one of the best as well as one of the most prominent workers on this part of the musical field, our readers may perhaps be interested to know something of the system on which he works, and the results he has achieved.

It is not very often that we get a glance into the secrets of an artist's workshop; but when this is vouchsafed to us, the glimpse is almost sure to be both interesting and instructive. In the present case we are not left to speculate on the process by which Franz obtained his masterly power of reproducing the missing portions of the old scores. In a pamphlet he published in 1871, entitled *Offener Brief an Eduard Hanslick; über Bearbeitungen älterer Tonwerke, namentlich Bach'scher und Händel'scher Vocalmusik* (Leipzig: F. E. C. Leuckart), he takes musicians into his confidence; and a short abstract of this pamphlet will best prepare for an examination of his score of Bach's great *Passion*, now lying before us.

He begins by saying that inclination, and perhaps also natural ability, led him to the study of Bach's and Handel's works; and that his post as conductor of the "Singakademie" at Halle gave him the opportunity of producing them. Of Handel, the only works accessible were those arranged by Mozart and Mosel; and we may remark, in passing, of the latter, that they are little better than pasticcios, as Mosel sometimes actually takes a movement out of one oratorio and inserts it into another! Bach's Cantatas

and Masses Franz only knew in the old and imperfect editions by Marx:—

"We performed the pieces," says he, "just as they lay before us, and imagined, simply enough, that the whole contents of the music were exhausted. True, the public sometimes opened its eyes when in a Bach Cantata a curious dialogue between flute and double-bass was played, or when the 'continuo' gave us the benefit of a long and sullen monologue—but such things did not trouble us further, but were set down to the account of the good old times, which we thought ourselves obliged to take as we found them."

The publications of the German Bach and Handel Societies, however, suddenly threw a new light on the subject. Here Franz found that the music bore a totally different aspect, especially in the case of Bach. Instead of the bare basses which he had met with in Marx's editions, he found the harmonies copiously figured—evidently, as he says, with some definite bearing on the way in which they were to be performed; so that it was plain that the mere outline which he had been in the habit of giving by no means reproduced the composer's ideas. His first method of dealing with the difficulty was a very simple one, and consisted merely in leaving out those movements which depended largely for their effect on a figured bass, and performing only those for which Bach had provided a tolerably full orchestration. He soon found, however, that this would not do; because most of the songs were in the former predicament, and by their wholesale omission, the connexion of the whole work was ruined, to say nothing of the fact that many of them were far too beautiful to be so ruthlessly rejected. He therefore resolved to try to complete the accompaniment. At first he experimented with simple chords; but this method again was unsuccessful. The harmonies, he says, fell as heavy as lead among Bach's parts, and besides could nowhere find a firm resting-place on his constantly moving basses; instead of supporting they only impeded the flow of the music. For a considerable time the task appeared to him impossible, and he deeply regretted the loss of many a fine song the accompaniment of which was only sketched. The sequel shall be told in his own words. He says:—

"One day, however, I went to work again, but this time with the intention of trying, for the sake of variety, the polyphonic method of harmonising. And lo! to my joyful surprise, everything suddenly became alive, the parts seemed only to have been waiting to be written down, and were evidently premeditated. I soon perceived that the sketches were no mere hasty outlines, but just as finished and complete as the movements which were written out in full. When the old masters wrote them down they conceived at the same time in their minds the web of harmony which was still wanting, and could dispense with it the more safely as they usually themselves undertook the accompaniment at the performance. The main task of the arranger must therefore be to arrive at the actual intentions of the authors, and to fashion his accompaniments accordingly; if the reconstruction must for obvious reasons be always problematical, still in many cases results may be realised which will not greatly differ from the intentions of the masters. Bach's figurings especially, often go into the minutest details—it required only a keen eye and a clever hand to be able confidently to reproduce his exact intentions. Nevertheless, the work is not everywhere so easy; many a time have I sat for whole days helpless

before a couple of bars, and know passages which it is hardly possible for our art-technique to solve satisfactorily."

Our author then proceeds to explain in more detail his method of procedure, both as regards the structure of the parts and the choice of instruments. Into this, however, we will not follow him here, as the subject can be better treated of in speaking of the score of the *Passion* itself, to which we will now draw our reader's attention.

Franz has prefixed to the work an introductory notice ("Vorbemerkung"), in which, after stating concisely the general necessity for some filling up of the figured bass, a point on which we have spoken above, he explains in some detail the plan he has pursued. In the score, all his additional parts are indicated by an F, and in other respects the original is faithfully reproduced. He has, however, added marks of expression throughout—in Bach's scores, they are for the most part "conspicuous by their absence"—and has also, where necessary, replaced obsolete instruments by their modern substitutes. Thus the air "Komm süßes Kreuz" has an *obligato* for the *viola da gamba*. In giving this part to the violoncello some slight modifications were necessary, as on the older six-stringed instrument various chords could be played which on the violoncello with only four strings are quite impracticable. The needful changes, it should be added, are made with the utmost discretion. Again the old *oboi d'amore* and *oboi da caccia* are replaced by clarinets. These are certainly less accurate representatives of their predecessors than *corni inglese*; and Franz recommends that the latter should be used where they can be had. At the performance of the *Passion* last Easter under Mr. Barnby, the *corni inglese* were used with excellent effect.

Another point in which we think Franz has shown admirable judgment is his treatment of the numerous airs in which the first part, according to the very common custom of the last century, is repeated. This long *Da Capo* is to our modern taste in the large majority of cases extremely tedious; and therefore the arranger, while retaining the original indications, has in several numbers given a compressed repetition of the first part of the air, which can be used by those who prefer it, while those who wish to have Bach, the whole Bach, and nothing but Bach, can simply turn back and repeat the whole first portions of the songs just as they stand.

The additional instrumentation is mostly given either to stringed instruments or to the clarinets and bassoons. In those cases in which Bach's original parts are chiefly for the wind—as for example in the airs "Buss und Reu," with two flutes, and "Ich will Dir mein Herz schenken" with two oboes, the string quartet is employed to fill up the necessary harmonies, so as not to interfere too much with the original tone-colouring; while in those pieces in which Bach scored chiefly or entirely for strings, such as the songs "Erbarme dich, mein Gott," or "Gebt mir meinen Jesum wieder" clarinets and bassoons are used, both to contrast with the strings, and as a substitute for the organ tone, which latter on account

of its "stiff and unpliant quality," Franz dispenses with altogether except in the choruses and chorals.

With respect to the use of brass instruments and drums, which are altogether wanting in the original score, Franz considers that their absence may probably be accounted for by the fact that at the time Bach wrote these instruments were almost exclusively used in brilliant and joyous music. The editor has introduced them with the greatest reserve; and for the sake of those who may prefer to omit them altogether, has nowhere made them *obligato*—that is, the harmony is always complete without them.

In the treatment of the plain recitatives (*recitativo secco*) Franz has not made use of the organ because of its unyielding quality of tone. He was not able to avail himself of the string quartet without violating Bach's obvious intention of confining its employment to accompanying the recitatives of our Lord. He has, therefore, had recourse to the piano, except in the case of a few of the more expressive passages, in which he has given the harmony to the clarinets and bassoons. His practice has been generally followed at recent performances of the work in this country, and those who expected that the use of the piano in sacred music would impart a secular tone to it, and be out of keeping with the character of the work, have been agreeably disappointed.

It is impossible, without the aid of musical quotations, to give more than a very general idea of what the additional parts are which Franz has added to the original score. In the choruses his work was, for the most part, tolerably easy. In many he has done nothing but add an organ part, while in others—as, for example, in the wonderfully fine chorus which concludes the first part, "O Mensch, bewein' dein' Sünde gross" and the "Lass ihn kreuzigen"—he has reinforced the wind parts, because Bach designed his music for so small a number of performers, that, with the large force now employed in our orchestras, the passages for the wind would be nearly, if not quite, inaudible. A word of praise must be given to his very judicious introduction of trombones and drums in the great chorus, "Sind Blitze, sind Donner in Wolken verschwunden," at that stupendous burst on the words "Eröffne den feurigen Abgrund, O Hölle," as well as for the fine effect of the employment of horns and trombones, *piano* with muffled drums in the noble elegy, "Wir setzen uns mit Thränen nieder," with which the work concludes.

If in the choruses Franz's task was not particularly difficult, it was far otherwise in the airs. Of these there are at least three the accompaniment of which, as printed in the score, is little more than a mere sketch. These are the bass song (No. 29), "Gerne will ich mich bequemen," which contains only a two-part accompaniment for violins in unison and basses, the tenor air (No. 41), "Geduld," in which nothing but a figured "continuo" is given, and the air for alto (No. 61), "Können Thränen," accompanied in the same way as No. 29. Besides these there are detached passages, which similarly required filling up, to be met with in nearly

every song throughout the work. Of the manner in which Franz has acquitted himself of his task in these pieces it is impossible to speak too highly. Perhaps the most remarkable example is in the tenor song "Geduld." Here the string quartet, flutes, clarinets, and bassoons are added to the figured bass, and the additions are so ingeniously founded upon suggestions of the original, and developed with such masterly command of the polyphonic style, that it is hardly too much to say that the score as it appears in this edition might have been written by Bach himself. Scarcely inferior are the other songs to which reference has been made. The great merit of the whole is reverence for the composer's ideas; the arranger obtrudes himself so little that it is only by comparison with Bach's own score that one sees how much has been done.

In one place, and in one only, do we venture with diffidence to disagree with Franz's additions. This is in the recitative No. 73, describing the earthquake at the crucifixion. Here Bach has relied for his effect solely on the bold modulations of the music, his only accompaniment being the customary "continuo" with a *tremolo* for the basses. Franz has introduced the full orchestra. The *tremolos* for all the strings, with chords for the trombones, and a roll on the drums impart a somewhat theatrical character to the passage, which makes it sound strangely out of keeping with the context. It is so evidently unlike Bach's manner that the remarkable tact and good taste shown by Franz throughout the rest of the work only makes this one passage the more surprising by the contrast.

At the performances of the *Passion* in Germany these accompaniments are, we believe, generally if not invariably used. In this country, however, they have as yet only partially been employed. It might be an experiment worth trying at some future performance to give the work just as Franz has arranged it; the airs at least, in which we have been too much accustomed to the "dialogue between the voice and the bass," of which our author speaks, would certainly benefit by the process. The whole score is a most interesting study to the musical student, and may be especially recommended as a model to those who are about to write "additional accompaniments" to any works of the old masters. EBENEZER PROUT.

THE EXHIBITION OF THE PAINTINGS OF CAROLUS DURAN.

I HAVE already spoken of the painter Carolus Duran, *à propos* of the last Salon, to which he contributed a nude figure of a young girl standing in a meadow. He called it *Deu*. I had seen him sketching it the summer before at Fontainebleau, where he takes a country house for the season. He had had a cage built, entirely of glass, about 13 feet square, in the park under the trees, in which his model could undress without fear of catching cold, while he could see the human flesh in full light, and in its exact relations of colour with the leaves of the trees, the verdure of the grass-plots, and the flowers of the borders. The sketch was curious, but at the Salon the painting appeared to me to have been touched up under the grey light and in presence of the sombre backgrounds of the studio. It was wanting in those reflexions, and also in that energy, whether in

drawing or colouring, which are typical of the true artistic illusion of nature interpreted by art. This year he has again introduced some nude bathing-girls in a park, but he has profited by previous criticisms. I have seen the picture in his studio, and it appears to me as a figure-painting, and more especially as a landscape, very superior to *Deu*.

He had also in the Salon of 1874 the portrait of his daughter, a child about four years old, standing with a little pet dog by her side. The whole is treated in the style of a bold sketch, and is now to be seen at the Exhibition of which I am about to speak. Last was the portrait of Mme. de Pourtales, in full dress, sitting in an arm-chair. The face is quite that of one of the queens of fashion during the Empire. The hands, pale, long and slender, are worthy of Vandyke. The aristocratic bearing, the fastidious and somewhat weary expression of this portrait, beside the qualities of force and harmony of colouring, reconciled to M. Carolus Duran many a critic who, not without some reason, had previously accused him of wilfully exaggerating the *bourgeois* side of his models.

The year before he contributed a portrait of M. Hoschedé's son, dressed in a complete suit of blue, no doubt recollecting Gainsborough's *Blue Boy*. Also an elegant and pleasing portrait of Mlle. Croizette, an actress now belonging to the Théâtre-Français. It represents a young woman, pettish and handsome, riding on horseback like a princess. She was in the saddle on the sea-shore, a little dreamy, like a pretty woman who is not accustomed to wait, or to arrive first at the *rendez-vous*. The Parisians, many of whom have never seen the sea, and horsewomen but rarely, found this composition "eccentric." It was rather exotic. But for the old race of Parisians a journey to the Bois de Boulogne is almost as rare as one to Hyde Park.

This portrait was, however, for suppleness and grace, a visible advance on those in the Salon of 1872; the portrait of Mme. Maurice Richard (wife of the Fine Arts Minister who was in office during the few months of the Liberal Empire), a good simple lady of the middle class, in vigorous health, visibly satisfied with being rich, dressing well, having a greenhouse full of flowers. And that of a "Belgian Lady," sitting on a sofa of very bright-coloured silk, with reddish hair, pink and white and stout, like a nymph of Rubens. By a bold and ingenious artifice, Carolus Duran had opened behind the face, bright as a peony, a red fan. It was a violent tone, which gave harmony to all the rest. There was far less outcry against the rude force of painting, which crushed the whole school, now so feeble, enervated, and colourless, than against the type which was thought commonplace. Meanwhile the lady came to Paris, and the Parisians were enabled to judge that the painter had only brought out the indications of a Flemish nature, young, healthy, loyally worthy of the handsome types that Rubens and Jordaens have loyally celebrated. To my mind, this is the masterpiece of M. Duran. Here the very first sketch is to be seen, and the spectator will be unable to avoid admiring the sincerity with which the artist has seized, at the first stroke of the brush, all the originality of race, all the typical perfection, all the amiability and simple goodness of the lady who was sitting to him for her portrait. After the Salon of 1872 he was made Chevalier of the Legion of Honour.

He had previously brought himself into notice by a very sensuous portrait of the wife of one of our novelists, Mme. Ernest Feydeau, who died about a year ago. He had in some sort made his *début*—for his earlier contributions were those of a young man still in search of his special line—by the portrait of his own wife, standing, dressed in black, with a red flower in her bosom, returning home, and drawing off her pearl-grey gloves, one of which has already fallen to the ground. Nothing can be more elegant, more feminine, and,

above all, more modern. The face is intellectual, and the costume exquisitely tasteful. It may be added that Mme. Carolus Duran is an artist herself. She has often sent to various salons miniatures and crayons, treated with remarkable freedom of touch. Here let us note that Carolus Duran models in clay with success. He exhibited a bust of his wife, cast in bronze, original and lifelike. It is good "painter's sculpture," whereby I mean that it seeks to represent the movement of the skin and the effect of the hair and accessories by means of thumb-strokes, which sculptors only tolerate in rough casts.

He is an agreeable man with a fine tenor voice. He stops short in the midst of his work as soon as he feels tired, takes a guitar, and hums Spanish airs, accompanying himself in a style that would bring to the balcony all the pretty girls in Granada or Seville. Just at present he has a passion for fencing. He practises every morning for several hours. In the street his cane, in the studio his brush or his maul-stick, rehearse without interruption thrusts in tierce or thrusts in quart. At the Exhibition, to which I am coming at last, may be seen the full-length portrait of his fencing-master, provost of a famous Paris fencing gallery, M. Vigeant. Carolus is of average height. He has black hair and beard, which have a fine effect on his somewhat Bohemian type of face. His age is a mystery, and he maintains the most extraordinary reserve on the subject. He appears to me to be more than thirty and less than forty. I do not think I can wound his vanity so long as I remain within these vague limits.

Carolus Duran was born at Lille. He was the pupil of an old pupil of David, unknown to the majority of Frenchmen, who, however, had already formed Jeaunon, and who directed the most artistic of our contemporary sculptors, Carpeaux. He was called Souchon—a name that must be treasured up and saved from the injustice of oblivion. Carolus Duran (who, I believe, is really called Charles Durand, but the dropping of the final *d* rendered his name more romantic when he came to Paris), gained a prize at the School of Fine Arts at Lille, which furnished him with the means of studying in Italy for three years. He availed himself of his opportunity. He likewise visited Spain, and you see at this exhibition a good copy which he executed at Madrid of Velasquez' *El Escivanto*; a dwarf, in a black dress, with his hat on his head, sitting on the grass, and turning over the leaves of a large book with a stern and intellectual look, and having an inkstand by his side. Such are the works which should have been bought in former days for the "Musée des Copies." Nothing can equal these studies executed by painters for themselves during the earnest and laborious years of youth.

Carolus Duran is not only a pupil of Souchon—who seems to have been a commonplace painter, but who was most assuredly an energetic teacher—and a pupil of Italy. He owes to their instruction some great compositions, among others, *L'Assassiné*, a tragic scene taken in the Roman Campagna or the Abruzzi, and now in the Lille Museum. But he likewise underwent, about 1860, the influence of Courbet. It is undoubtedly to this master that he owes the decision which he imparts to his portraits. Courbet, as you know, had the capacity of his brain been in proportion to the accuracy of his eye and the firmness of his hand in painting, would have caused a radical revolution in our school. I am indebted for the remark to the lips of Delacroix himself. He would have upset all romanticism and Academy, even as David, eighty years before, had cut off the tail of the school of the eighteenth century. The works of his youth, an *After Dinner*, a *Funeral at Ormans* especially, are works of capital importance in the history of our school, which, unfortunately, were not continued or developed, and which, after having served as a butt to the feelings of disgust and of rage of the *bourgeois* reaction, are now too much forgotten. But

the frank and audacious doctrine of these works, so sincere in their modernness, was not sufficiently explained and practised. Its pupils became neither apostles nor martyrs. Only within the last few years have we seen some of its seeds ripen which had fallen upon good ground. Courbet as a revolutionary was incomplete. He upset, but he did not rebuild. Perhaps this is the mysterious law of the dark times through which we are passing.

The Exhibition which is the subject of the present letter is arranged in the hall of the "Cercle de l'Union Artistique," in the Place Vendôme. The room is large and not well lighted, a very sensible inconvenience at this time of year. There are thirty-seven portraits, studies, sketches, and landscapes, all hitherto unexhibited, except the child with the red scarf mentioned above. Among the subjects handled with a vigour of unpremeditated science for which we must give our young master great credit, there are the portraits of M. Jules Claretie, full face, with a smile suggestive of that sweetness and brightness of intellect with which his works are so lavishly adorned; M. de Lesclure, a Legitimist writer, with a remarkably firm and sincere expression; Falguières, an excellent sculptor, of a melancholy type of face; the profile of the present writer, which is said to be a very good likeness, and which was painted one morning in the course of conversation in less than three hours; Hars, a picture-dealer, with light brown hair, long red whiskers, and a mottled red and white complexion, like that of the sons of Albion who win prizes at steeple-chases; the Count d'Hennecourt, a vigorous half-length of a French officer, young and well dressed, in a frockcoat closely buttoned up, with a cigar in his mouth, his hat on his head, and the fair complexion of our Norman countrymen.

There are also some female portraits. But women do not understand sketches. They attach great importance, and very rightly, to those skilful combinations of dress to which they have recourse for the purpose of enhancing their beauty, concealing their age, eclipsing their rivals, and leaving to posterity a triumphant proof of the most pleasing fiction. They pose but ill, and cannot be restrained from giving advice as to the dimensions of their mouth and eyes. Carolus triumphs skilfully over all these difficulties. He is in fashion and deserves to be. He has no works here so exceptional as those in the last Salon, at least, so far as full-lengths are concerned. His half-length portrait of Mme. d'Hennecourt represents a touching and graceful countenance. I may note also a little girl sitting on a chair, tired of her toys, which litter the carpet.

His landscape studies are bright and accurate. Two or three sketches—*Victory*, a plain strewn with the corpses of soldiers foully mutilated by battle; and *The Temptation of St. Theresa*, a group of nude women, which would be more suitable in a *Temptation of St. Antony*—give a promise of good pictures, being well composed, and presenting beautifully graduated keys of colour.

But where M. Carolus Duran wins all suffrages—for the fact must not be concealed that he has a great number of enemies: the pupils of the Academy, who find him too realistic; the realists, who regard him as a renegade; the fastidious, who reproach him for too strongly insisting on costume masculine or feminine; the lovers of the dreamy in art, who find his colouring too strong and his touch too frank—however, where he wins all suffrages is in three sketches of his children. These are undoubtedly worthy of the Spanish school. They represent his little girls at the age of four or five months, with black round eyes fully open to the light, with mouths as purple as a cherry freshly plucked from the tree, with wisps of hair peeping out from under a little white cap, red and white faces puffed out and throbbing with that surprising strength peculiar to a child with a good constitution and good health. In one of these sketches, *Bébé s'amuse*, the lovely little creature is sitting at a table; she

is leaning forward, laughing, screaming, stretching out her dumpy arms and dimpled hands towards a parrot which is making havoc of some biscuits in a dish. The delicious *gaucherie* of early infancy, the energy of mirth, the bloom of health, the glow which animates the chubby face, and gives a vague foretaste of the indomitable caprices of the future woman, have been felt and are rendered with masterly breadth. If I am not deceived, it is in these observations of nature, full at once of homeliness and of majesty, that those who are true artists are revealed. Such is modern art—that is, high art unceasingly renewing its youth. In any case such are what are styled good pictures in public galleries and the collections of enlightened amateurs.

PH. BURRY.

NOTES AND NEWS.

M. RAJON is certainly one of the masters of modern etching, and his reproduction on a scale that is amply large of Mr. Watts's portrait of John Stuart Mill is one of the most noteworthy of his works as a copyist at once faithful and intelligent. As far as we can remember the original portrait, nothing of its character is lost, while the etcher has legitimately brought into his work some artistic quality lacking even in the admirable work of Mr. Watts. Rajon is an etcher of the most varied skill. Though always, or nearly always, a copyist, he identifies himself, so to say, with the artist he is reproducing, as an actor with the character he is playing. He is of seemingly inexhaustible resource: not less at home when translating the subtleties of expression in a portrait by Watts than when translating the atmospheric effects due in the first place to the genius of De Hooche. By the side of Jacquemart and Léopold Flameng he worthily takes his place, for he is more various than either of these, and only a little less perfect.

PROFESSOR CURTIUS, the historian of Greece, has just contributed to the Academy of Science in Berlin a long paper on the armorial devices of the ancient Greeks, showing how they came originally from Assyria, and were modified by the artistic sense of the Greeks. One has only to look at the now very rich collection of early engraved gems from the Greek Islands in the British Museum, to see how strongly with their constant choice of animal forms—mostly quadrupeds—they suggest Oriental influence. So far the evidence is elaborate and carefully presented by Professor Curtius, but on proceeding to speak of artistic style in ancient heraldry, he leaves at least one possible and certainly very plausible argument unanswered. He attributes it to artistic taste when the ancient (heraldic) gem engraver placed, say, two rampant lions, the exact counterpart of each other, confronting. But he forgets that the intention may very well have been to produce a seal which could be cut exactly in two, as has been the custom in more recent times, one-half to be confided to the person carrying a sealed despatch and the other half retained by the sender. What he calls the dualism in ancient heraldry would thus be traced to a utilitarian rather than an artistic sense. From a dualism, he says, the ancients proceeded to a trias—that is, a third element was introduced into the design in the form of an upright line, pillar, branch, or other object between the confronting animals. But here again nothing is easier than to suppose that this middle object served no other purpose than to mark more distinctly the line where the seal was to be cut in two.

THE *Gazette des Beaux-Arts* is an expensive (8 francs) but by no means a super-excellent number this month. With the exception of a short notice, with a portrait, of A. J. Lesenne, a clever designer of vignettes, who died in 1827, and M. Clément de Ris's third and last article on the Stockholm Museum, the whole of the number is devoted to exhibitions and to art as applied to in-

dustry. 1. We have an article by M. A. Darcel on the Exposition of Religious Art at Lille, of which Mr. J. W. Weale gave an account in the ACADEMY of July 11. 2. On the Exhibition of National Manufactures, by Albert Jacquemart, dealing especially with the Gobelins and Beauvais tapestries. 3. On the Union Centrale in respect to its exhibition of metal work. 4. A second article on the Library of the Union Centrale, profusely illustrated with engravings from M. Texier's *Monuments Modernes de la Perse*. And 5. "Considerations on Costume," by Charles Blanc, à propos of the recent costume exhibition. This is really too much of Industry for a Fine Art review. The *Gazette* has always maintained a high character by its valuable contributions to art literature, but it will scarcely be able to retain it if it continues to accord as much space as it has done all this year to exhibitions and art industries. A review of some of the new illustrated books and the usual bibliography of works on art published in France and other countries during the past half-year, fill up the number. This bibliography is, as usual, very imperfect. Only six English books are mentioned, and not one German, yet several important works have been published both in England and Germany during this period. It is quite absurd under such circumstances to call this inadequate list a "Bibliographie des Ouvrages publiés en France et à l'Étranger." Such a title only serves to mislead.

We hear that M. Emile Olivier, the ex-minister of Napoleon III., is employing his leisure in the study of art. He has been residing for some time in Rome, and it is understood that he is preparing a work on the Sistine Chapel.

THE price of the catalogues of all departments of the Louvre has been lowered one-third since December 1. This is well, for one used to have to spend quite a small fortune in acquiring the Louvre library of catalogues.

DEMOLITION under the name of restoration seems to be carried on at least as much in France as in England. A great outcry is at present being raised by all archaeologists and veneration of old Gothic work in France, concerning the so-called restorations at the beautiful Norman cathedral of Evreux. It appears that the restoring architect has already destroyed a portion of the thirteenth century nave, and positively proposes to pull down the remainder in order to rebuild it in a different style. Considering that modern architecture at best can only present us with a feeble and lifeless imitation of ancient work, it is surprising that any architect dare venture to destroy monuments in which the life and thought of past ages still beats.

FRANCE seems to have become really alarmed of late lest she should lose her long-continued supremacy in matters of art and taste. The Union Centrale has been making vigorous efforts to arrest the decline in the national art industries that is already making itself perceptible; and now M. de Chennevières, in a report to the Minister of Public Instruction, expresses considerable fear lest foreign nations, with larger resources at their command, should end by developing their art manufactures to a greater extent than France. The French school, after the losses it has undergone, has "pressing need," he considers, of "being excited and regenerated by the solicitude and foresight of the Administration;" and especially the schools of design need the best possible organisation, for on them will depend to a great extent the future of the arts in France. But what is to be done? he asks in moving accents—"Que faire, Monsieur le Ministre?"—when the budget provides nothing, or next to nothing, to avert this menacing crisis; and the National Assembly, although it recognises the danger, finds it impossible to augment its supplies by a sufficient measure.

In this extremity a brilliant idea has suggested itself to M. le Directeur's mind. It is that an exhibition shall be opened in Paris of all the "inestimable marvels of Art contained in the various

museums of the departments." In these museums there are many valuable works by old masters that are to a certain extent rendered useless for purposes of instruction and gratification by reason of their difficulty of access. The new official inventory of the riches of art in France enumerates as many as 600 to 700 pictures of the first order that are scattered among the provincial towns.

The gathering of all these together in one grand exhibition will certainly make a goodly show and have a great interest for lovers of art. The proceeds of the exhibition are to be devoted to the benefit of the schools of design. This is the way M. de Chennevières proposes to supply the deficiencies of the budget and re-establish the supremacy of France.

M. de Cumont, the Minister of Public Instruction, has, in furtherance of this project, addressed a letter to all the maires of France, asking for their co-operation, and the Union Centrale has charged itself with preparing a suitable place for the exhibition.

THE sale last week at Christie's consisted of the decorative property of Mr. Benjamin, the late well-known dealer. It occupied four days. Among the objects sold were:—Lot (83) statuette of a Bacchante, 21 inches high, of carved ivory, 53*l.* 11*s.*; (100 and 101) a pair of groups, carved in ivory and wood, of *Hercules and Omphale* and *Saturn and Venus*, 108*l.*; (110) *Milo rending the Oak*, bronze, 20 guineas; (195 and 196) pair of tulip-wood cabinets, with Sèvres plaques, 195*l.*; (151) gilt clock, Cupid and Psyche, 91*l.* 7*s.*; (172) Zincke, miniature of gentleman in blue coat, 25 guineas; (192) tortoiseshell box, with enamelled portraits of Louis XV. and a Lady, by Petitot, 57*l.* 10*s.*; (295) pair of bronzes, *Roman Warriors*, 100 guineas; (329) commode, with mosaic plaques, and wreath of flowers in pietra dura, 160*l.*; (392) toilet glass, with frame of chased silver enriched with lapis lazuli, 141*l.*; (491 and 492) pair of red buhl cabinets, 64*l.*; (498) black cabinet with inlaid marbles, 44*l.* 2*s.*; (536) pair of Chinese enamel vases, 41 guineas; (589) set of twelve equestrian portraits of the Caesars, Limoges enamel, by J. Laudin, 75*l.*; (595) portrait of William IV., enamel, by Bone, 19 guineas; (580) pair of Dresden enamel cups, 30 guineas; (616) chased ormoulu casket, inlaid with blue and white Wedgwood medallions, 29*l.* 10*s.*; (617) pair of Vernis Martin vases, 13*l.*; (636) Goojerat casket, engraved with ornaments and inlaid with gold, 21 guineas; (637) Gothic chasse, with figures of saints in niches, 29*l.*

THE Russian papers announce the death of the distinguished Russian architect Jean Ivanovitch Gornostaiew.

WE regret to learn from the *Times* that Hogarth's picture of *Strolling Actors in a Barn* was destroyed in the fire at Littleton House, near Staines, on the 18th instant. The painter's receipt for the purchase-money was attached to it, showing that it was painted for Mr. Wood, of Littleton, in 1741 for twenty-five guineas. It is stated to have been insured for 1,000*l.*

THE STAGE.

"THE MERRY WIVES OF WINDSOR."

SCHLEGEL, in his Lectures on Dramatic Art and Literature, chose to consider *The Merry Wives of Windsor* along with the historical plays of Shakspeare, instead of with his comedies. He did so nominally, because it was better to consider the character of Falstaff as a whole—in *Henry the Fourth* and in *The Merry Wives* together—but really, I suppose, because he held that *The Merry Wives* existed only for the sake of Falstaff: that in Falstaff was the beginning and the end of its interest. Not indeed that the further development of Falstaff, by his creator, in *The Merry Wives*, suggested to the German critic any observations very new or profound. The German

critic allowed himself, here as elsewhere, to say many things that lay quite on the surface, as it seems to us nowadays, and for this apparent slightness of his there may be pleaded at least a couple of reasons—the first, that he wrote in the beginnings of criticism, and the second, that he wrote for Germans before the Germans had learned to know Shakspeare. But be the slightness what it will here and there, the critic's utterances can never be wholly disregarded, and there is some interest in noticing how entirely Schlegel seemed possessed with the belief that the *The Merry Wives* had little in it beyond the character of Falstaff.

Nor has this judgment on the piece been generally reversed in our day. *The Merry Wives* is not a popular favourite, and critics writing and talking in the present week have spoken of its fun as burlesque, and have condemned it with the phrase that much of it would have been hissed off the stage to-day, if Burnand—not Shakspeare—had written it. The tradition is that it was composed within a fortnight—composed to order—Queen Elizabeth desiring (and everybody has heard the story), that Falstaff should be presented as in love. This generally accepted tradition, and the unusual quantity of mere word-play in the piece, afford objectors such foundation as they have for their objections; but one reason, we suspect, why it fails of popularity just now (and has, for the matter of that, failed any time these hundred years), is that much of its humour is directed at passing manners, which we have never found ridiculous just because we have never come across them. Perhaps in a certain sense, if so rough and ready a term may be allowed, it is an un-Shakspearian comedy—at least upon the surface of it—and some confirmation of such a conjecture as that may be admitted to be found in the very frequent exclamations one heard at the Gaiety, of "That's not in Shakspeare!" "That's a gag" (an added thing); whereas, as I took the trouble to observe, there was not one of these passages exclaimed against in indignant whispers among my neighbours, but was Shakspeare's own.

Here then, perhaps more than elsewhere as a whole, has Shakspeare descended to our common talk. Here, as only in one or two others of his plays, has he followed in the way of such of his contemporaries as drew from just the common life about them all their inspiration. Something of the relation that melodrama bears to tragedy, this piece bears to the poetical comedy which we are wont, in Shakspeare's work, to love the most. Here the higher imagination did not come, or came but fitfully at the call of a fortnight's notice—if we accept that tale. In place of inventive wit, we have keenness of observation; and in place of ideal character, a few eccentric types (Sir Hugh Evans and Dr. Caius say) marked with one knows what a sure hand. We have a well-knit story: a story to the plot of which justice is hardly done by those who omit to notice in the intercourse of Falstaff with Ford as the jealous Brook, its almost exceptional neatness and ingenuity. We have, beneath the surface, surely, after all, the unerring truth; but on the surface the caricature of manners of the day: foibles some of which are gone (to be succeeded by others no better), usages we do not recognise: types we have forgotten: a fat knight, who with increasing age loves women still and wine, but has a slacker stream of humour, though just the old readiness of resource: a cluster of foul-mouthed retainers: a foul-mouthed host who breaks once or twice into hasty poetry (as in his description of Fenton, with his "eyes of youth"): good women enough, like Mistress Page and Mistress Ford, but from whom no secrets of men's vices are hid: and across this picture of besotted tavern life, rude jesting, and failing lechery, there passes, like a gleam of purer light, the tender figure of Anne Page, which is "pretty virginity," which "has brown hair and speaks soft, like a woman."

It is Master Slender, we all know, who, in that

phrase, qualifies her—Slender, who is not given to discriminate at all: who loves her only "as any woman in Gloucestershire," and who, if he loved her more exclusively, would nevertheless break down in the description of her, for he is not strong at definition; thinking, you remember, that he has told you something you did not know before when he has said of bears, that women cannot abide 'em, "they are very ill-favoured, rough things." The vague description of Anne Page accords exactly with her place, and that of her pure loves, in the story. Sweet, but shadowy, her place is a small one: behind the bustle of Falstaff and the Merry Wives she is well-nigh hidden.

The acting at the Gaiety, though far indeed from being at any point absurdly bad, is not generally of a kind to add at all to what attractions the play has. Whatever the traditions of the part may be, and whatever the lack of vigour in the actress, I find no very grave fault with Miss Furtado as Anne Page. Her grace and the absence of strong individuality alike suit the character. Miss Rose Leclercq, who appears as Mrs. Ford, is not indeed by any means an accomplished actress of Shakspeare, but she does not offend, and she has ease and a certain geniality and gentleness which contrast not badly with Mrs. Wood's inventive spirit, rapidity, and self-reliance. It is always Mrs. Page who takes the initiative, and Mrs. Wood, who represents her, is clearly unaccustomed to be second; but Mrs. Wood's manner, though lively and active, is not very varied, and in the rather long speech in which Mrs. Page proposes the third plan for the humiliation of the Knight there is a wearisome and inexpressive sameness of gesture. Still, in recollection of the general liveliness, we would not insist too much on this detail. As Dame Quickly, Mrs. Leigh delivers her words intelligently and with sign of experience; but she labours, as before, under the disadvantage of a stage-appearance which in its want of mobility is curiously inexpressive.

The part best acted, but not—let us remember, the most difficult part to act—is that of Mr. Ford, by Mr. Hermann Vezin. He is most excellent after his first scene with Falstaff. He shows us well that Mr. Ford is not merely an incarnation of jealousy. He is other indeed than a *bourgeois* Othello. He is a determined man, anxiously suspicious; not alive to what there may be that is ridiculous in the open show of his jealousy; but yet not merely jealous—ready to laugh heartily at Page, who has laughed at him: ready to laugh or act in anything, as the occasion may require. Page is a smaller figure, played genially enough by Mr. Belford. Fenton is represented with care and good discretion by Mr. Forbes Robertson, who failed nevertheless to realise for us at once the description of the host:—

"he capers, he dances, he has eyes of youth . . . he smells April and May."

Mr. Arthur Cecil and Mr. Righton represent respectively the two grotesques, Caius and Sir Hugh Evans. The first is satisfactory; the second to be found fault with only on the score that he is not quite as funny as might have been expected. Mildness and complacency mark the Hugh Evans of Mr. Righton, and though one who has noted with extreme satisfaction the brilliant characterisation and individuality in Mr. Righton's lawyer of the *Two Roses*, in his Jew of *Creatures of Impulse*, and lastly in his Verges, looked not unnaturally for a rather more marked performance than this of Sir Hugh Evans. Mr. Righton is probably doing well in restraining himself as the eccentric parson, who was after all a man of sober life and quiet ways, since it is he who sententiously points the moral of the play:—

"Sir John Falstaff, serve Got, and leave your desires, and fairies will not pinse you."

Mr. Taylor is Slender, and one that will pass, and Mr. Maclean is Shallow. The last word is

for Falstaff—Mr. Phelps. His performance does not bring before us the Falstaff of our fancy. There is a certain dry humour about him, but he appears to be unmoved by it, and to be content that the audience shall notice it, as in the gesture that accompanied his gift to Dame Quickly of his empty purse. This suits the older high-life comedies better than it suits the humane genius of Shakspeare. We know, of course, that Falstaff in the *Merry Wives* is not so prosperous a fellow as once he was. He should nevertheless be genial, for reverses do not crush out and extinguish a temperament, though they may modify it and tone down its expression. This, to my thinking, is too lonely a Falstaff. His happiness is to quaff liquor, but to quaff it alone. There is nothing social in this man's pleasure. There is no unction in the man. It is only physically that he is the "greasy knight"—one doubts that, even—it is only physically that he is "a man of continual dissolution and thaw." But, saying all this—and taking special exception, as I do take, to the dry, monotonous, and lecturing way in which Mr. Phelps, in his second scene with Ford, tells all about his adventures in the buck basket—one must say also, though those who have experience of Mr. Phelps know it already, that no point is missed from want of care or want of judgment; that every sentence is planted deep in the man who is to hear it; that every action has its reason and significance. For Mr. Phelps, the choice of Falstaff, in the *Merry Wives*, was nevertheless not a wise one. He can play the character, of course, but with the comprehension born of study and pains: never enlivened, that I see, by sympathy.

FREDERICK WEDMORE.

WE hear that Mr. Robert Buchanan has completed a new poetical comedy, and that the principal part in it is destined for Miss Isabel Bateman.

WHEN the Vaudeville re-opens, this Saturday evening, after a week's closing, the performance of *Two Roses* will be resumed, but shortly after the Christmas holidays a new comedy by Mr. Henry J. Byron will be produced, to take the place of Mr. Albery's most popular piece.

It is said that Miss Litton will soon give up the management of the Court Theatre, and that the house will afterwards be under the direction of Mr. Hare, late of the Prince of Wales's, and that Mr. and Mrs. Kendal will then make their first appearance at the Court.

MR. ALBERY's next piece will be a romantic comedy in five acts. It will be produced before long at the Olympic Theatre, where it will succeed *The Two Orphans*.

THE St. James's Theatre closed last week, very suddenly.

MR. JOHN HOLLINGSHEAD was first in the field with a new pantomime this season. It is called *Cinderella*, and was brought out at the Holborn Amphitheatre, whither a part of the Gaiety Company has been drafted. The efforts of Miss Loseby and Miss Katrine Monroe are supported by many wonderful performers less purely artistic. Their feats, like comic annuals, please at Christmas-time. An adaptation by Herr Meyer Lutz of music of Rossini's was given by a well-chosen orchestra.

MDME. PASCA—a well-known actress whom the Russians praise perhaps too highly—has been playing at the Théâtre Michel, in St. Petersburg, Croizette's famous part in the *Sphinx* of Octave Feuillet.

M. SARCEY contributes to *Le Théâtre* the first part of a paper on M. Got, who has now for some years been the leading comedian at the Théâtre Français. The paper is more anecdotal than critical, but it narrates that Got's first marked success was won in 1848, on a night when

Paris was astir with Revolution. The piece was Alfred de Musset's *Il ne faut jurer de rien*. Soon afterwards Got became acquainted with M. Emile Augier, and the acquaintance resulted in the more or less unconscious fashioning of some of Augier's pieces in accordance with the talent and temperament of Got. In those early days of his, Got offended Charles Maurice—a notable critic of that time: a very Sarcey for vigour and plain speaking—and Maurice attacked him in his criticisms. Got was too sensible to attribute the fault-finding to mere personal spite. "He always finds out my weak points," said Got, "and I am open to correction. His are the only criticisms which I read."

It is announced that after January 1 no French piece will be allowed to be acted in Alsace and Lorraine.

La Boule—the last success at the Palais Royal—has just been received enthusiastically at Brussels.

CADOL, the author of *Les Inutiles*—a success which has not been followed by a second—has written for the Théâtre Lyrique Dramatique a drama called *La Famille*.

ON Monday, Racine's birth was duly celebrated at the Français and at the Odéon. The Français gave *Phèdre* and *Les Plaideurs*. In *Phèdre* Mlle. Sarah Bernhardt acted for the first time the title rôle.

M. BALLANDE, at his Matinées in Paris, has had the courage to produce a new work, and it is not the first time that in doing so he has given beginners a hearing. M. Cournier was on this occasion the fortunate author, and his piece is a comedy, in five acts, called *Une Famille en 1870*. The first three acts exhibit at somewhat wearisome length, though with not a little of keen observation, the life led by a very commonplace bourgeois family before the trouble of the war. Monsieur has known how to make a fortune, but not how to govern his house. Madame is dominant, and is ambitious; the daughter flirts with a young cousin until an old nobleman proposes to her; and the son spends his father's money with great good nature and freedom. The fourth act portrays for us some of the sufferings of the siege—exposes to view a still open wound. For this theme the time has hardly come: at all events it is too early for its realistic treatment. The fifth act dwells not on the incidents of the war, but on the sentiment it has produced, and thus the right note is struck for the first time, and the piece closes with the recall of the *dramatis personae* to duties too much forgotten. The piece bears, in this way, some little likeness to *Jean de Thommeray*; and like *Jean de Thommeray* it has been founded upon a novel.

M. EMILE ZOLA has published in a volume his comedy of the *Héritiers Rabourdin*, which, when it was acted, was badly received alike by public and critics. He is the author of several stories which have merit, but have not deserved a very high success. He complains, in his preface to his comedy, of the treatment he received from his critics, but he is reminded by the severest of them that he must not attribute to ill-will the adverse judgment that was pronounced. When it is part of a man's profession to go to the theatre and write about it, he will probably be thankful to the dramatist who can give him something pleasant to write about. And the critic, indeed, it is true, is the last person who should omit to welcome anything that is interesting. "Quelle triste vieillesse vous vous préparez," said the wise old abbé to the king who couldn't play Whist. And what a weary time of theatre-going does the critic prepare for himself, when by having barred the way to works of new merit he ensconces himself in perpetual companionship with the accepted dullness and incapacity.

AN excellent English translation of Mosenthal's drama of *Isabella Orsini* has been quite recently published at Braumüller's, in Vienna. *Isabella Orsini* is one of the happiest efforts of the author of the well-known *Deborah*, and has been performed many times at the Vienna Burgtheater, and almost all the other German theatres. As one of the translator's, Professor Dr. E. Vincent's, adaptations has already been produced in England with success, it is to be supposed his latest work will find its way to our stage.

THE principal theatres in Paris number forty-two, containing altogether accommodation for 57,080 persons. The Cirque d'Hiver will seat the largest audience (4,000); next in importance comes the Châtelet Theatre with 3,600 seats; then follows the Théâtre du Château d'Eau with 2,000; the Gaité and Ambigu, each with 1,900; the Porte St.-Martin, the Grand Théâtre Parisien, the Théâtre Lyrique and the Opéra Comique, each with 1,800; the Italian Opera and the Odéon, each with 1,700; the Théâtre Français and the Variétés, each with 1,400 places, &c., &c. The buildings holding the smallest audiences are the Salle St. Laurent and the Salle des Familles, each with 450 seats. The new Opera House has space for 2,400 persons.

MUSIC.

ST. JAMES'S HALL—SCHUBERT'S OCTETT.

FEW works have ever sprung more rapidly into popularity than Schubert's octett for stringed and wind instruments. Produced in this country for the first time on March 4, 1867, at the Monday Popular Concerts, it has since been so frequently repeated there that last Saturday's was its twelfth performance. Mr. Chappell seems to have hitherto enjoyed a monopoly of the work; for, excepting the performance at the Crystal Palace, to which I shall return presently, I am not aware that up to the present time it has been heard at any other concerts in this country. The reasons for this are probably to be found in the work itself. True it is a great favourite, and deservedly so, at St. James's Hall; but it is not everywhere that eight *virtuosi* can be found for their respective instruments; and this octett requires the finest and most finished playing to bring out its beauties. In none of his compositions is Schubert's overflowing wealth of melody more remarkable; some of the themes, such as the second subject of the first *allegro*, and all the subjects of the *andante*, are equal in charm to anything that can be found in his songs. The octett has not the tragic force and grandeur of the great quartett in D minor, nor the romantic beauty of B minor symphony; but it is just pure Schubert in his genial and most joyous frame of mind. There is hardly (a rare thing, by the way, with this composer) a tinge of sadness to be found throughout the music; but one delightful melody follows another, as if spontaneously, carrying the hearer irresistibly along. As regards its thematic treatment, the work, like many of Schubert's, is comparatively weak; the developments appear less to grow out of the main themes than to be appended to them; but the composer's genius, and especially his marvellous gift of "tune," triumph over everything; and the verdict at which the hearer is compelled to arrive at the close of the work is that, whatever may be the technical shortcomings, it is absolutely impossible not to enjoy it.

Another great charm of the octett lies in its exquisite orchestration. Suggested, doubtless, by Beethoven's well-known septett, it is written for the same combination of instruments, with the addition of a second violin, to complete the family of the strings; and the instrumental effects obtained are simply delightful. The horn especially is treated with rare felicity, as witness the lovely solo passage in the first *allegro*; and the combinations of tone-colour are frequently as novel as

they are beautiful. The way in which the balance is preserved between the wind and the single stringed instruments is masterly; and I was on Saturday more than ever confirmed in the conviction I expressed in these columns on the occasion of the performance of the work at the Crystal Palace (see ACADEMY, March 21), that the experiment of converting the work into a quasi-symphony, by playing it with a full orchestra, is a grave artistic mistake which can only result in a caricature.

The performance of the octett on Saturday was on the whole an excellent one, though open in one or two points to criticism. The string parts were excellently played by Messrs. Straus, Ries, Zerbini, Piatti and Reynolds (double-bass); and the clarinet, bassoon, and horn were in the competent hands of Messrs. Lazarus, Winterbottom, and Paquis. The last-named gentleman deserves especial mention for his most artistic performance of the very difficult horn part. There were, notwithstanding, two blemishes of importance in the rendering of the work to which attention ought to be called. The first was the omission of two movements—*andante con variazioni* and *minuetto*. These two numbers ought no more to be left out in a performance than the corresponding portions of Beethoven's septett, which are invariably performed. When the octett was first produced there existed a very valid reason for their omission in the fact that they were not published in the old edition of the parts. Since then, however, they have been not only published, but also played at St. James's Hall; and therefore the former reason for their non-performance no longer holds good; and such a work, if given at all, ought certainly to be given as the composer wrote it. The other shortcoming in the performance on Saturday arose from the fact that Mr. Reynolds, like nearly all our English double-bass players, used a three-string bass instead of one with four strings. The latter, which has a compass of a fourth lower than our English instruments, is invariably in use in Germany, and German composers always write for it accordingly. By its non-employment it becomes necessary to transpose many of the lower passages in the double-bass part an octave higher. This was done on Saturday, in many cases to the utter destruction of the composer's idea. It is to be hoped that at future performances of this work a proper four-stringed bass will always be employed.

The pianist on Saturday was Dr. Bülow, who gave a highly characteristic rendering of Beethoven's "Moonlight" sonata, and joined Signor Piatti in a really magnificent performance of Mendelssohn's sonata in B flat for piano and violoncello. It was impossible in listening to this beautiful work not to be struck by the contrast as regards the finish of the workmanship with Schubert's octett. Few people would think of ranking Mendelssohn as high as Schubert in creative genius; but as regards mastery of form there can be no question that the younger composer is far superior. No one, not even Beethoven himself, surpassed Mendelssohn in complete command of the "technique" of composition. I have already said that the performance of the sonata was a magnificent one; but I must add that Signor Piatti, if possible, surpassed himself. The perfection of his tone and phrasing, and especially the deep feeling which he threw into the slow movement, cannot be described on paper. Finer playing has never been heard.

The vocalist was Miss Leonora Braham, who sang an old-fashioned but pleasing song by Paisiello and Schubert's "Meine Ruh' ist hin" with much taste and considerable *tremolo*.

EBENEZER PROUT.

THE last of the Crystal Palace Saturday Concerts before Christmas was given last Saturday, when Sir Frederick Ouseley's oratorio *Hayar* was performed. This very unequal work was com-

posed for the Hereford festival of last year, and was first produced on that occasion. As might perhaps be expected from the Professor of Music at the University of Oxford, which position, as many of our readers will be aware, Sir Frederick holds, the fugal writing is the finest part of the present work. The concerts will be resumed on January 16, when Beethoven's symphony in A is announced, and Mr. Oscar Beringer is to play Schumann's concerto in A minor.

THE Mendelssohn house at Berlin, which has long enjoyed a world-wide renown from its association with departed genius, is about to be pulled down, and rebuilt in a form better adapted to secure a profitable rental for its proprietor. It was familiar to travellers as well as to native-born Berliners through the black marble tablet on the front which recorded in gold letters that within its walls "the immortal M. Mendelssohn had lived and laboured, who was born at Dessau in 1729, and died at Berlin in 1786." The house was subsequently occupied by Rammner, Mylius, Nicolai, Lessing, and the younger Mendelssohn.

THE King of Bavaria has again come to the rescue of the Wagner enterprise at Bayreuth, and advanced a sum of 18,000 florins to aid in the completion of the new theatre, the actual cost of whose erection and fitting up far exceeds the estimates.

A GRAND bazaar under royal and aristocratic patronage has just been held at Berlin in aid of Wagner's Bayreuth scheme, which has been so successful that on the first day alone 7,000 thalers (1,050*l.*) were taken.

OF Beethoven's "Missa Solennis" in D there was an ideal performance a week ago in Vienna. The solo parts by Mmes. Marie Wilt (Vilda), and Karoline Gomperz-Bottelheim, and Herren Walter and Rokitansky; Concertmeister Joseph Hellmesberger was the leader, and Johannes Brahms conducted. Brahms corrected on this occasion a traditional mistake. At previous performances the A was always beaten on the drum in the twenty-ninth bar from the end of the "Agnus Dei," and further on—on the wrong supposition that the drums, which are originally in B flat and F, must change their key after the D flat movement to D—A, and the B flat in the last twenty-nine bars of the Mass was taken as a misprint for A. At the beginning, however, there is the note "Tympani in B—F," and this instruction is not altered throughout the score. The B near the close is, therefore, no error. The mistake has been repeated through all the performances for many years, and even Julius Stern introduced it into his pianoforte edition. Brahms has now restored the original text. The boldness with which the B appears in the drum is of enormous effect—says Dr. Hanslick in the *Neue Freie Presse*. It should be added that in this country, so far as we are aware, the drum part has always been played as Beethoven wrote it.

SPOHR's "Paternoster" was performed at the Sing-Akademie in Vienna with small success, and the lately discovered four-part Hymn in D by Friedemann Bach ("Cantate Domino") is pronounced by competent critics to be one of his weakest works. The Komische Oper prepares for production *Die Beiden Schützen* by Lortzing, *Der Musikfeind* by Genée, *Gille et Gilloin* by Ambroise Thomas, and *Jean et Jeannette* by Victor Massé. Schumann's "Manfred" music was to be performed in Vienna (for the first time the complete work) on the 22nd of this month, conducted by Herr von Herbeck. Herr Lewinsky will recite the poem. A quartett by Herbeck was performed for the first time last week at Hellmesberger's soirée.

A PRIZE of 1,000 thalers was offered some time since by a committee at Dortmund, for a musical setting of a hymn in honour of Bismarck. One

hundred and fifty composers have sent in works for competition, among which are over a hundred for soli, chorus, and full orchestra, twenty-five songs with pianoforte accompaniment, four large instrumental works, eight marches, and one sonata for piano. The successful competitor is not yet announced.

THREE new symphonies (which the *Musikalisches Wochenblatt* speaks of as "striking works") by Ph. Rüfer, H. Urban, and W. Barziel, have been produced at Berlin.

POSTSCRIPT.

THE *Times* announces that Victor Hugo has sent to the printer the first and second parts of his new poem, which is a sequel to the *Légende des Siècles*. It is entitled *Les Quatre Vents de l'Esprit*, and is divided into parts—the "Vent du Drame," the "Vent de l'Ordre," the "Vent de la Satire," and the "Vent de la Comédie." The first part contains three unpublished dramas in verse.

THE New Shakspeare Society has resolved to follow the example of the Early English Text Society, and offer to a certain number of colleges and schools, in which English is systematically taught, some of the Society's publications as a yearly prize for an examination in Shakspeare. The first set of books thus offered to each college or school will be the Society's editions, by Mr. P. A. Daniel, of *Romeo and Juliet*: 1. A reprint of the Quarto of 1597; 2. A reprint of the Quarto of 1599; 3. Parallel-Text of the two Quartos of 1597 and 1599; 4. The revised text, with critical notes and introduction by Mr. Daniel. The kindness of Prince Leopold has enabled the Society to include his gift to its members among the books it will yearly offer as prizes. Any college or school desiring these books should apply to the New Shakspeare Society's director (Mr. F. J. Furnivall, 3 St. George's Square, Primrose Hill, London, N.W.); or honorary secretary (Mr. A. G. Snelgrove, London Hospital, E.).

TABLE OF CONTENTS.
